FOREST AND STREAM KENNEL. Llewellin setter, Rattler, in the stud. Rattler is a handsome blue belton, black points, winner of four bench prizes; sire, Rob Roy, he by Laverack's Fred, out of Slatter's Phœbe, founder of the field trial strain, winner of five English field trials, out of pure Laverack imported bitch Pickles; she by Llewellin's Prince, winner of two firsts and three championships, out of Llewellin's Lill II.; no better blood in America. Will serve bitches at $15, litters warranted. I am breeding to Rattler the following bitches:—Meil, a beautiful blue belton, black points, sire Jack, dam Spot, winner of first and second specials at Detroit, Mich., 1878, also first at Boston 1879 in native classes; Fly, a very fine roan belton bitch, sire Shot, dam imported Fannie; Pat, orange and white, out of Belle, by Royal George. Puppies bred from above, fine stock, for sale cheap. Address, with stamp, L. F. WHITEMAN, Detroit, Mich. Decll,tf

FOR SALE—Five English setter puppies, whelped Oct. 8th, all black, small star on breasts; sire Jet, dam Flora, both black and thoroughly broken. For pedigrees, prices, etc., address G. CANNATA, Detroit, Mich. Decll,3t

WANTED TO EXCHANGE.—Rabbit hound—broken, for a young setter dog. Address E. PARSONS, Bristol, Bucks Co., Pa. Decll-1t.

The Kennel.

Train Your Own Dogs.

BY THE USE of M. Von Culin's patent Spike Collar, dogs of any age, no matter how old or stubborn, can be most thoroughly trained in a fraction of the time required by any other method. I have trained dogs broken of all faults, no matter how long practiced. Dogs broken of bird biting, gun-shyness, whip-shyness, shot-breaking, unsteadiness on the point, chasing birds and rabbits, hedge hunting. Any dog, old or young, taught to retrieve (put in your hand) as a duty, no play; to point game, to back-stand, drop to shot, hand, wing and word, to quarter his ground, and work to hand and whistle. To hunt up headed for live game and for foot scent in retrieving cripples.

DISTEMPER AND WORMS.

Distemper and worms kill more dogs than all other diseases combined. Learn how to prevent and cure. Send 25 cents for 70 page book on treatment of all dog diseases.

Send 2ct stamp for letters from sportsmen in all parts of America, who have used my collar. Price with book of instructions post paid $3. Address M. Von Culin, Delaware City, Del.

All lovers of dogs and horses should send for the "Kennel and Field," full of rich information on training, breeding, care, etc. Treats of all cases of dogs, and full of information which can be gleaned from no other source. Price only 50 cts. Address

THE KENNEL AND FIELD PUBLISHING CO.,

25 FOX HOUNDS AND PUPS FOR sale or exchange for Sporting Implements. The finest bred and fastest in America. Every dog warranted. L. M. WOODEN, 129 Bowers Block, Rochester. ju24 tf

FOR SALE——Red Irish Setter, with little white; three years old; good size and strong-built dog, and well feathered, and kind and easy to handle; put him in the field and he will attend to his point, you never had a dog that will not hunt the birds for him to stand; he will find them for you. He is fast, staunch as a rock; backs a dog on a point; great endurance; good nose as ever put on a dog's face; as good as any man's dog on quail; been hunted on woodcock and snipe; lowest price, $40. H. H. VONDERSMITH, Lancaster, Pa. Nov27 tf

FOR SALE.—Two Gordon setter bitch pups; full-blooded; perfect black and tan; six months old; good size; with pedigree on both sides. Also one Gordon setter dog, two years old; winner of first prize on the bench; perfect black and tan, and a perfect field dog; all broken, with a full pedigree; a rare chance for a good dog. Enquire of CHAS. T. BROWNELL, P.O. Box 350, New Bedford, Mass. Nov27

LAVERACK BLOOD FOR SALE,—Pups by the renowned sire of prize-winners, the pure Laverack setter dog Carlowitz; orange and white ticked, lemon Belton and chestnut Belton; dams of whelps from prize-winning stock; whelped July 3d and July 12th; price lower than the lowest. Also two whelps by Carlowitz, dam Princess Nellie, she by Pride of the Border, by Petrel. M. VON CULIN, Delaware City, Del. Oct9,tf

FOR SALE—Champion Berkley pups, red Irish setter pups, by Champion Berkley, out of Aura, she by Blarney, out of Eileen, both imported. Whelped June 29, 1879. ROBT. SAUTHOFF, Box 1, South Windham, Me. Sept 25-tf

IN THE STUD.—The pure Laverack dog Pride, by Pride of the Border x Petrel. The only pure Laverack in New England. Fee, $30. Address H. F. DEANE, Box 1,612, Boston, Mass. Sept. 4—t. f.

The Kennel.

THE FOLLOWING PRICES will show I mean sell out!—

Victress, pure Laverack, full sister to the Great Countess, one of the best bitches that ever lived. She is by Old Blue Dash II. and Moll III. Victress won two prizes—Manchester, E. C., Birmingham. To parties in want of a pure Laverack to breed this is a rare chance. Price $75, not one-half what she cost; was sold at public outcry in England for $200.

Irish setter Gipsey, red, and some white; hunted some on quail; very obedient and easy to handle; sire of Gipsy, Rodman's Dash, who was the best Irish setter on game in the United States. She is a good brood bitch, and just served by my red Irish setter King Rex, who was sired by champion York; a perfect beauty, and if she fails to pup will serve her free next time, but she never missed. Price only $35.

France, a field trial bitch; a beautiful head; ears hung low; a good brood bitch; never hunted her; bought her in June; will guarantee her to stand a pigeon in yard for twenty minutes, and from her movements I think would be good in field. Price $35. Litter of pups worth four times that amount.

Llewellin setter bitch one year old, blue ticked; raised and bred by L. H. Smith, of Strathroy, Ontario, Canada; sire, Paris, and dam, the pure Laverack bitch Peeress; Peeress and Paris are both broken, and Paris is one of the best field dogs in this country, that money cannot buy; the Chicago *Field* of Nov. 8th, '79, gives a cut of the famous Paris and his field winnings and on the bench; parties buying will get pedigree and his winnings printed. Price only $50. These are bottom prices.

Address H. B. VONDERSMITH, Lancaster, Pa. Nov. 27-tf

A GREAT INVENTION!

IMITATION
STAINED GLASS.
Patented December 3, 1878.

CURTAINS, SHADES, AND BLINDS

Dispensed with. New, Elegant, Cheap and Durable. It produces all the unique effects of a richly painted or Elegantly Stained Window. It is easily applied to the glass in Windows of Houses, Public Buildings, Churches, Steamboats, Street and Railroad Cars, Libraries, Parlors, Offices, Bath Rooms, Stairways, Transoms, Vestibuie Doors, etc., with the full effect and brilliancy of variously colored ground glass. The article has *just been patented*, and not a single agency has as yet been established.

ONE GOOD MAN in each State wanted, to whom exclusive territory will be reserved for five years.

SAMPLES of three of the most beautiful styles will be sent prepaid with full instructions, wholesale prices, etc., on receipt of $1.00.

Agents Apply to **L. Lum Smith,** Patentee & M'f'r.
717 SANSOM ST., { Sole Agent for U. S. & Canada.
PHILADELPHIA, Pa.

READ the following extract from the *Representative Agents' Paper* of the world, *The Philadelphia, Pa., Agents' Herald*:

"We regard the above as the most remarkable and beautiful invention ever patented, and would advise the Agent readers of the *Herald particularly* to be on the alert to secure choice territory. The article is so simple, and yet will be in such universal demand, that it will undoubtedly meet with a most enthusiastic reception and large sale. It will offer the best opportunity for coining money that has ever been presented to Agents, and the business being light, neat and respectable, will be peculiarly adapted to ladies and gentlemen who from timidy, etc., have hitherto been deparred from engaging in the agency business, for want of some meritorious and suitable article to canvass for. Another very important feature of attraction is that all goods purchased will be promptly forwarded to even the most remote section of the country *free* of express or freight charges.

AGENTS' HERALD
The Largest, Spiciest, and only
REPRESENTATIVE PAPER OF ITS KIND.

ACTIVE AGENTS GIVEN GOOD EMPLOYMENT EVERYWHERE

by over 200 responsible advertisers in this month's issue of the *Agents' Herald*. Grand outfit, including circulars, terms, and a beautiful 10x14 engraving of the *Smithograph*, sample card and full particulars of the AGENTS' DIRECTORY and sample copies of last month's *Agents' Herald*, all for 10 cents. Yearly Subscription, $1.00. One cent stamps taken. We cannot afford to give the paper away, so don't ask us. Address in haste,

"THE FISHING LINE."

TAKE THE

Grand Rapids & Indiana R.R.

Mackinaw, Grand Rapids and Cincinnati Short Line

FOR THE

Trout, Grayling, and Black Bass Fisheries,

AND THE

FAMOUR SUMMER RESORTS AND LAKES OF

NORTHERN MICHIGAN.

The waters of the

Grand Traverse Region

and the Michigan North Woods are unsurpassed, if equaled, in the abundance and great variety of fish contained.

BROOK TROUT abound in the streams, and the famous AMERICAN GRAYLING is found only in those waters.

The TROUT season begins May 1 and ends Sept. 1.

The GRAYLING Season opens June 1 and ends Nov. 1.

BLACK BASS, PIKE, PICKEREL and MUSCALONGE, also abound in large numbers in the many lakes and lakelets of this territory.

The sportsman can readily send trophies of his skill to his friends or "club" at home, as ice for packing fish can be had at many points.

TAKE YOUR FAMILY WITH YOU. The scenery of the North Woods and Lakes is very beautiful; the air is pure, dry and bracing. The climate is peculiarly beneficial to those suffering with

Hay Fever and Asthma Affections.

The hotel accommodations are good, far surpassing the average in countries new enough to afford the finest of fishing.

During the season Round Trip Excursion Tickets will be sold at low rates, and attractive train facilities offered to Tourists and Sportsmen.

Dogs, Guns and Fishing Tackle Carried Freet owner's risk.

It is our aim to make sportsmen feel "at home" on this route. For Tourist's Guide (an attractive illustrated book of 80 pages), containing full information and accurate maps of the Fishing Grounds and Time Cards, address A. B. LEET, Gen. Pass. Agent, Grand Rapids, Mich.

Through Pullman Palace Sleeping Cars between St. Louis, Minneapolis and St. Paul.

Burlington, C. Rapids & Northern Railway.

QUICKEST, CHEAPEST AND BEST!

TWO PASSENGER TRAINS each way daily, between Burlington, Albert Lea and Minneapolis, crossing and connecting with all East and West Lines in Iowa, running through some of the finest hunting grounds in the Northwest for Geese, Ducks, Pinnated and Ruffed Grouse and Quail. Sportsmen and their dogs taken good care of. Reduced rates on parties of ten or more upon application to Gen'l Ticket Office, Cedar Rapids,

E. F. WINSLOW, General Manager. C. J. IVES, Gen'l Passenger Agent. tf

TO SPORTSMEN:

The Pennsylvania R. R. Co.,

Respectfully invite attention to the

SUPERIOR FACILITIES

afforded by their lines for reaching most of the TROUTING PARKS and RACE COURSES in the Middle States. These lines being CONTINUOUS FROM ALL IMPORTANT POINTS, avoid the difficulties and dangers of reshipment, while the excellent cars which run over the smooth steel tracks enable STOCK TO BE TRANSPORTED without failure or injury.

THE LINES OF

Pennsylvania Railroad Company

also reach the best localities for

GUNNING AND FISHING

in Pennsylvania and New Jersey. EXCURSION TICKETS are sold at the offices of the Company in all the principle cities to KANE, RENOVA, BEDFORD, CRESSON, RALSTON, MINNEQUA, and other well-known centers for

Trout Fishing, Wing Shooting, and Still Hunting.

Also, to

TUCKERTON, BEACH HAVEN, CAPE MAY, SQUAN, and points on the NEW JERSEY COAST renowned for SALT WATER SPORT AFTER FIN AND FEATHER.

GUNPOWDER.

DUPONT'S

RIFLE, SPORTING and BLASTING POWDER.

The Most Popular Powder in Use.

DUPONT'S GUNPOWDER MILLS, established in 1801, have maintained their great reputation for seventy-eight years. Manufacture the following celebrated brands of Powder:

DUPONT'S DIAMOND GRAIN,

Nos. 1 (coarse) to 4 (fine), unequaled in strength, quickness, and cleanliness; adapted for Glass Ball and Pigeon Shooting.

DUPONT'S EAGLE DUCKING,

Nos. 1 (coarse) to 3 (fine), burning slowly, strong, and clean; great penetration; adapted for Glass Ball, Pigeon, Duck, and other shooting.

DUPONT'S EAGLE RIFLE,

A quick, strong, and clean Powder, of very fine grain for pistol shooting.

DUPONT'S RIFLE, FG, "SEA SHOOTING," FFG and FFFG. The FG for long range rifle shooting, the FFG and FFFG for general use, burning strong and moist.

SPORTING, MINING, SHIPPING, and BLASTING POWDERS of all sizes and descriptions. Special grades for export. Cartridge, Musket, Cannon, Mortar, and Mammoth Powder, U. S. Government standard. Powder manufactured to order of any required grain or proof. Agencies in all cities and principal towns throughout the U. S. Represented by

F. L. KNEELAND, 70 Wall Street, N. Y.

N. B.—Use none but DUPONT'S FG or FFG Powder for long range rifle shooting.

THE HAZARD POWDER COMPANY

MANUFACTURERS OF

GUNPOWDER.

Hazard's "Electric Powder."

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. *only.*

Hazard's "American Sporting."

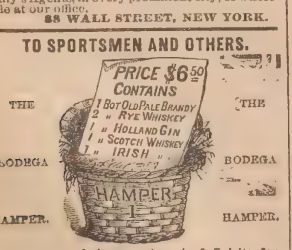
Nos. 1 (fine) to 6 (coarse). In 1 lb. canisters and 6½ lb. kegs. A fine grain, quick and clean, for up-land prairie shooting. Well adapted to shot guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6½ and 12½ lb. kegs. Burns *slowly* and very clean, shooting remarkably close and with *great penetration.* For field, forest, or water shooting, it ranks any other brand, and it is equally serviceable for muzzle or breech-loaders.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG in kegs of 25, 12½, and 6½ lbs. and cans of 1 lbs. FFFG is also packed in 1 and ¼ lb. canisters. Burns strong and moist. The FFFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard *Rifle* Powder of the country.



Superior Mining and Blasting Powder.

GOVERNMENT CANNON and MUSKET POWDER; also, SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF, MANUFACTURED TO ORDER.

DITTMAR POWDER.

Champion Shot Gun and Rifle

POWDER OF THE WORLD!

IS UNEQUALLED BY GUNPOWDER

for strength, accuracy, cleanliness, and gives little smoke, recoil, or noise. It is absolutely safer than gunpowder, as it cannot explode when not confined, and does not strain the gun or heat the barrels as much in rapid firing. CaptainBogardus, champion wing-shot of the world; Dr. Carver, champion rifle-shot of the world; Ira A Payne, and all the leading shots, use DITTMAR POWDER in their matches. Our challenge to shoot a long range rifle match, as published in our circulars, was never accepted, and is yet open to the world. Address

Nepigon River and Lake.

NUMBER II.

IT is always difficult to reach the Nepigon River. The steamers advertising to land at Red Rock seldom reach it. The place is difficult of access, for frequent fogs and the intricate channels leading into Nepigon Bay defeat even the best laid plans. One cannot be certain of reaching the river at any given time. So, last summer, we were hardly disappointed when we were told to go ashore at Prince Arthur's Landing, and were compelled, in company with another party, to charter a tug to carry us ninety-five miles to the river.

It was too dark to go further when the skipper anchored on the bar at the mouth of the Nepigon. We had passed through the bay in the fading twilight, and had seen the islands so like the forms of sleeping lions, back against the purple hues of the distant mountains. When the anchor dropped, sending over the smooth water the expanding ripples towards the shore, we caught sight of the solitary light of an Indian camp-fire in the distance, and saw on either side the dim outlines of high cliffs which we were to see more plainly on the morrow.

We slept on the floor of the little cabin. We were roused in the early morning by the rattling of the anchor chains and the hoarse whistle of the tug and its echoes from the mountainous shores. Getting on deck before the boat was well underway, we observed, as we passed along, the changing scene gradually lighting up as the sun rose among the hills. Now and then, through the light mist which hung close to the surface of the water, we could catch sight of a canoe with its owners going to visit their nets; and, as the mist rose, the reflection in the smooth river of the great piles of green crowned rock seemed to add to their height and gave new beauty and grandeur to the scene. Steaming slowly up the current, we had leisure to appreciate the glorious views of river, cliff, and mountain on every side, and as we look back upon it now, and search in our memories for scenery more impressive, we find few places, indeed, which will compare with the entrance to Nepigon River.

We were not long on the way up the river, before we came in sight of the white buildings of the Hudson's Bay Company's post, at Red Rock. It was about 5 o'clock when the tug tied up to the dock and the first glimpse of the lowest rapids could be seen. The agent of the company came down to meet the boat, and a few Indians who had heard the whistle were waiting our arrival. Swarms of black-flies welcomed us, also, and, until we had a smudge, made things quite lively. Mr. McLaren, the company's officer at that post, treated us very kindly, and gave us every assistance in his power consistently with his duty.

It was not long before the Indians gathered in from far and near. They were in better condition than those I had met in some places further down the coast, and seemed contented—particularly so when they could take a meal with our Sault Ste Marie voyagers. We had to get canoes and Indians, and we were not sorry to see them come in, willing, as most of them were, to be employed where pay was sure and food plenty. But haste in selection is bad policy; so we took it leisurely, and first divided our stores so as to leave enough at Red Rock to carry us through, in coasting from there to Sault, in the Mackinac boat we had bought for that purpose. We kept the market open for good opportunities, however.

Canoes and men were offered and rejected. Our party, R. F. and myself, needed two canoes, and two Indians in addition to Louis and Antoine, the Sault voyagers, as we had a long trip in prospect and carried considerable weight of stores. It was early in the afternoon that we engaged Wabagabo (White Staff, or, literally, Standing-up White,) and his canoe—a good, staunch craft, rather too flat looking and warty to be handsome—and he and his mother-in-law, a not extremely well-favored squaw, set about pitching it. This took till evening, and was well done; for Louis, our chief guide, went over it carefully, applying his lips to all doubtful places to be sure no leaks existed.

R—— had known Wasa-Kesich (Light Sky) for several years, and after the latter's arrival on the scene, we were not long in securing his services. "Wassy," as we called him, "for short," was a prize. He was honest (as they all, or nearly all, are), faithful, industrious, untiring, and cheerful, albeit a genuine heathen. In the weeks he served us, we saw nothing in which he could have been improved by the missionary, excepting, possibly, in personal cleanliness, and in that particular, judging from the "converted" Indians I have met, it is very doubtful whether missionaries would have helped him. That approach to godliness don't seem to be much cultivated among the "converts." Now, Wabagabo was an educated Indian, could read and write in his native tongue, and English, had been baptised as Peter; but, except in honesty, rivalled Light Sky in no human virtues that we knew of, although he served us fairly; but he required spurring rather often for comfort.

Peter's canoe carried most of the heavy stores, and myself—not a very light weight. Wassy's, four feet shorter, and rather cranky, carried some light baggage; and seated on the bottom during nearly all the trip, could be seen the picturesque if not graceful forms of R. and F.

We started about 10 o'clock the next morning—the men taking the canoes up the rapid, while we walked the portage track to the foot of Lake Ellen, just at the head of the rapids. It was a hard tug—the first always is—for the men to bring the loaded canoes up into the lake. They are not then "in condition," but a few days of good food and constant work hardens them up, and they will do an amount of labor which seems amazing to men of sedentary life. We stepped carefully aboard the slight craft, waved farewell to young Mr. McLaren who had come up to see us off, and cut loose from all civilized entanglements for several weeks.

Some three miles up the lake we entered the narrow channel of the river. It flowed smooth as oil, but with great volume and power. Shortly after dinner one of the brigade canoes with five or six Indian paddlers, and with Mr. McLaren in charge, dashed up by us to bring down a large boat then at camp Alexander. They made good time and when we arrived at that point, they were about starting back down the river. There was formerly good fishing at this camp, and some fine trout are taken there yearly, but we took the portage at once and camped a half mile further on, on the back of a warm creek, at the end of a water way which is the foot of the heavy portage. These two portages are called Long Portage, being some two miles in length, the short canoeing making a grateful rest for the wearied men. We could have made the whole portage that night, but as we had planned to fish Cameron's Pool we stopped at the place I have mentioned.

Cameron's Pool is one of the finest on the river. It is the hardest to reach, and therefore the least visited of the famous ones. Leaving three men at camp the next morning to take over the heavier stores and traps to the head of the portage, Louis took us in the small canoe down the creek and across the rapids, and landed us on the bank where the trail to the pool commenced. Securing the canoe on the bank, he led the way at a rapid pace, which told heavily on us, unused as we were to such rough traveling, and in a few moments we were in the brush and rocks with no sign of a trail to be found. The general direction was plain, however, and we struggled on over rocks and fallen timber, and through moss and brush and flies. The day was hot, and the breeze blowing down the river could not reach us in the dense thicket. A half mile of this and we struck open country, and skirting a swamp, we soon found ourselves on the brink of the pool, hot and weary. Throwing our tired bodies down in the grateful shade of the rocks we abandoned ourselves to the enjoyment of the magnificent scenery, and the refreshment of the cool breeze. In front of us was a fall of over fifty feet and below us the great river swept, before taking the next steep and white rapids down the valley, round and round in an immense eddy into whose clear depths we could see trout uncountable.

F. was the first to cast his fly, and it had hardly dropped upon the water when the crash of his second joint showed he had struck a big fish too strongly, and he retired for repairs. The extra joint was quickly rigged, and we were soon all so engaged in such glorious sport that we forgot the fatigues of the tramp and had a realization of the pleasures of Nepigon fishing about which we have dreamed so often. An hour so spent brought aches in new places, and we stopped for a while to prepare dinner. Louis had in the mean time built a low wall across a tongue of water between some rocks, and when we gathered around it to look at our captives we had the first full consciousness of what we had achieved. More than twenty huge fellows lay there, sparkling in their beauty and making rushes, not always vain as we soon found, for liberty. Two or three that had been killed in the fight were cooked, and with the provisions we had brought with us, we made an excellent meal. About two o'clock we resumed fishing, taking as many as we felt justified in killing, but no more. There were seven mouths to supply, controlled by appetites of no ordinary capacity. When we started back there were in the sack on Louis' shoulders twenty-two trout, weighing between seventy and seventy-five pounds. Besides these, a few small ones had escaped through the wall, and some of the larger ones had leaped over it. The largest was taken by R., four pounds. It was a rare day's sport, and the memory of it will remain with us fresh and sparkling for many a long year. Louis led the way back with his load of fish on his shoulders, and camp kettle and axe in his hand, over a route slightly more practicable than the morning path, and we at last got safely back to camp and much needed rest.

At seven the next morning we were off. The men took packs which it seemed impossible for them to carry. We started on ahead with our rods and a few light traps, but before we had made a half mile we were overtaken and passed by the loaded men in their swift pace. Wassay, with his canoe turned over his head, a few light packages dangling from either end, went by us on that dog trot peculiar to the canoe Indian, and we had not long to wait and rest at the head of the portage before the canoes were loaded and we stepped aboard.

The wind as well as the current was against us, and the work was pretty heavy all that day. The river extends into several broad lakes through which we had to pass, and we crossed from side to side to take advantage of eddies and sheltered places, and to escape from time to time the swift current which in any other river, almost, would be called rapids. About three o'clock we reached Split Rock, or Cathedral Rock Cañon. Just below this cañon the range of mountains forming the Eastern bank of the river from where it leaves Lake Nepigon down to this point, terminates in a massive wall of rock, and the heights on either side, together with the rush of water between, form a view which impresses the observer with a sense of awe and wonder. At Cedar Portage a huge rock raises its head a hundred feet or more right in the middle of the fierce rapid, and on the east the mountain rises almost perpendicularly from the water's edge over thirteen hundred feet, relieved only by straggling clumps of stunted bushes which have sprung up from the debris at the foot of the precipice; while on the west the lower heights are clad in the verdure of the cedar and balsam, and of the few deciduous trees which find life there.

Cedar Portage is short and rough. It detained us only a brief time, and a half hours' hard paddling between these great and sometimes overhanging rocks brought us to the foot of Island Portage—a short and easy one, but upon the main land. There is a dangerous one over the island in the fall, but it is not often used. While the men were making this portage we cast a few times below the fall, but without substantial success—at least as Nepigon fishing goes.

A mile above is the foot of Pine Portage, which we soon reached. This portage is about one and three quarters miles long, and is a fair one. We took our rods, flies and landing nets, and without waiting for the men started off for Hamilton's Pool. After a mile and a quarter of trail, we came to a path leading off to the right, within hearing of the roar of the falls, and we plunged down the steep hill and in a few moments found ourselves on the brink of the beautiful pool. It was near seven o'clock. The western sky was overcast, the muttering of distant thunder could occasionally be heard, and the deep valley was beginning to grow gray as in the dusk of evening. We were to camp on the little grassy plot where we stood, and if we were to have fish for the morrow we must take them that Saturday night. So little time was lost in rigging our tackle, and putting on some light flies we started out, as much for "meat" as sport. It was past seven o'clock when our flies first touched the water, and the trout seemed as anxious to catch the flies as we were to capture them. In an hour we gathered together at the camp, with an aggregate of thirty fish, the largest three and three quarter lbs., and averaging over two and a half lbs. The average weight was not large, as will be seen, for we had brought in every trout captured, fearing we should be short in the supplies the next day. It was, however, lively work, for each had to use his own landing net—no easy task in the swift water.

We were too busy and it was too late that night to note the beauty of our surroundings. The darkness came on rapidly, and the threatening storm so shortened the twilight that we hurried into camp with the spoils with scarcely a moment for enjoyment of the scenery. So the next morning brought to us almost a new revelation. The roar of the falls had been music in our ears all the night. The glorious view was a delight to our eyes in the morning. The fall, something over fifteen feet in height, was broken into three distinct ones by some rocky islands on the brink, and as the water rose in great swells below, it sparkled like a huge gulf of champagne. It was a constant wonder to us all that day. The river seemed to move in frequent but irregular pulsations, and the charms of our camp and its surroundings were ever new and freshening. It rained at intervals through the day, and we sat in our tent watching the great stream ebb and flow, and bubble and scuttle as it rushed on unendingly. With every rising wave from the depths below the fall, schools of minnows were thrown to the surface, and were followed by hungry trout in hurried chase. In a space thirty by forty feet out in the middle of the pool, I counted forty-four trout clear of the water, in ten minutes, two frequently hold of the same unfortunate minnow; and it was no rare occurrence to see twenty or more in the air at the same moment in different parts of the pool. Among them all we saw none less than two pounds in weight, and many we judged to be upwards of four pounds.

Although we had intended breaking camp on Monday morning, the loveliness of the place and the certainty of

good sport kept us there another day. We kept no count of the numbers of fish caught. In fact, the trout rose so readily we fished only a small part of the day. My own best sport was in leaving the sure places and going down along the rocky and difficult shore, snapping my fly through the undergrowth into the stream and having the odds against me in a fight. It is not easy work to use a light rod through the brush, to play and tire powerful fish, and then, with rod and net work one's way down to the water's edge and secure the prize. The line could hardly be kept taut, and with a moment's slack the trout is gone, a fly lost, or hook detached. Yet, with all these odds, I took into camp five fish, the smallest three pounds and the largest three and three-quarter pounds. It was wonderful sport, and in as delightful a place as ever my lines were cast.

We broke camp on Tuesday morning and went on up the river. The scenery up to Little Flat Rock Portage is of the grandest description. Above that, in the route to Lake Nepigon which we followed, it is comparatively tame and uninteresting. A few miles above that portage we left the river, turning off to the left through the artificially deepened channel of a little stream, the outlet of a shallow lake known as Big Sturgeon Lake. The stream has been improved by the Indians removing stones from the bottom and piling them on the sides of the creek, so the depth is increased and the water way narrowed, and the passage of loaded canoes made practicable.

This narrow and shallow "canal" is known by the Indian name "Waupchekinnegan"—at least that is as near as I can spell it. It is the usual passage way of canoes going between Red Rock and Nepigon House, and makes a shorter route than by Nepigon Falls.

We had a hard pull against a heavy wind and sea through Big Sturgeon Lake. The canoes were heavily loaded, and only the most skilful management brought us safely, with but little water shipped, to the foot of Big Flat Rock Portage, which is well named. Thence a tramp of nearly two miles over a smooth path and we stood upon the high, bare rocks, whose bases were washed by the clear and beautiful waters of Lake Nepigon.

C. C. H.

OUT WITH THE DUCKS.

DUCK SHOOTING ON THE CHESAPEAKE.

HAVRE DE GRACE is the headquarters of the "sink boat" shooters—about forty professional outfits being licensed ($20 each). The outfit consists of a small sailing craft, twenty-five to fifty feet long, a small flat-bottomed row-boat, a "sink box," and 300 to 500 decoys. It requires three men to work these boats, decoys, etc.

Some of the shooters live constantly aboard their crafts, others only the night previous to the legal days for shooting, viz, Mondays, Wednesdays and Fridays after the 1st of Nov. By law these craft are not allowed to go upon the shooting grounds before 3 o'clock in the morning. And shooting cannot commence until one hour before sunrise, and may continue until half an hour after sunset. No shooting from sink boxes is allowed within one-half a mile of the shore.

Many craft anchor near the line within one-half mile of shore, and immediately after 3 o'clock go upon the grounds and proceed to set out the decoys as soon as they can see to do so, usually about 4 or 5 o,clock, which requires an hour for the three men; then shooting may commence if it is light enough and within one hour of sunrise. The first two hours of the morning are usually worth as much as the remainder of the day; sometimes as many as fifty to one hundred birds are gathered on the first trip out of the batteau. The sloops are usually anchored one-quarter of a mile from the sink box. Nearly all the boxes are single, that is, but one person can shoot at a time, though there are a few double ones; convenient where two persons wish to shoot together, but a disadvantage practically, as the ducks do not dart so well to them, owing to the fact that two persons can be seen more readily than one.

It is an advantage to have two guns, the spare one loaded with long-range cartridges; preferably Ely's wire shot cartridges, to kill cripples. I cannot speak too highly of these long-range cartridges in any kind of duck shooting, particularly in "punt shooting" and "bushwhacking" where you may kill at more than 100 yards. These cartridges may be had of the principal gun dealers in the large cities, already loaded with shot varying in quantity from one ounce to two and three-quarters, from the small sizes of shot up to a bullet of gauges 8, 10, 12, from seventy-five cents to $1 per dozen. In ordering them, state gauge of gun, size and quantity of shot required. Krider, of Second and Walnut streets, Philadelphia, and Squires, of No. 1 Cortlandt street, New York, keep them. I should think that they might be used in choked guns, but your gunsmith should be consulted on this point. Concentrators, to be had everywhere, are very serviceable for moderately long-range in cylinder bores.

For ten gauges, four to five drachms powder and one and one-quarter to one and a half ounces No. 4 chilled shot are generally used. The writer used an eight gauge, twelve and three-quarter pound English gun, made by Thorne, of Pall Mall, paper cases, four and a quarter inches long, eight drachms Hazard's coarse No. 4 best duck shooting; also Curtis & Harvey's make of Colonel Hawker's "punt powder;" and two ounce No. 4 chilled shot, concentrator in left-hand barrel, water-proof, white felt and pink edge wads over powder. Delaware fibre wads over shot glued in. It is a great error to cut off cases; put in two or three pink edge wads over powder, pound down with mallet, and you may shoot five drachms of powder in No. 10 shell without cutting off; load to leave an eighth of an inch to turn in. If you have very long shells, as I had—four and a quarter inches—which I could not load to nearer than one inch of the top, creasing with a creaser, or still better, gumming or glueing, are the only proper methods of loading extra long shells, the cutting off practice of many otherwise good gunsmiths to the contrary, notwithstanding.

I arrived at Havre de Grace, the evening of November 10th, one week after the shooting commenced; the weather was very unfavorable—warm and calm—though at the opening on the third and fifth—the first cold days we had—the weather was all that could have been desired.

The night was spent at the Harford House, quite near the depôt (terms about $1.50 per day).

On Tuesday I engaged my gunners, the price being $35 per day; sloop, batteau, sink-box, 350 decoys, services of three men, and such meals as I chose to eat. The first night was spent on the sloop, whose cabin about 6 feet by 6, and 3 to 4 feet high, was by far the most uncomfortable place I ever occupied; mostly on account of my companions, composed of three snoring men and a hot stove. What a long sleepless night, from 6 in the evening to 3 in the morning.

We proceeded across the line at 3 o'clock, came to anchor at 4; set out decoys, and began to shoot as soon as one could see, which was about 6 o'clock. The flight is the best at this time of any part of the day, and if a large bag be an element in the sport, the best and most experienced shot should be in the box for the first two hours.

Good shots find the awkwardness of the position in the box very trying at first—all this, with the errors in judging of distances, do not give many dead ducks to amateurs. On signal from the shooter, men come from the sloop in the batteau to gather dead, kill over cripples, and relieve the shooter for an hour or two.

Redheads and blackheads are the principal kinds of ducks killed; after these canvas backs, bald pates, and black ducks. Greasers and moor hens are not shot by professionals. We killed about twenty ducks of all kinds each day, being out two days, but one of which was a canvas back. One should be able to recognize the different varieties of duck while on the wing, otherwise in shooting at a moor hen one may spoil the chances of a possible shot at a canvas back. Professionals have a great advantage here.

The men with whom I was, killed 160 ducks the first day; netting them above $60. Other men have been known to kill above $100 worth of ducks in a day, only one person shooting at a time in the box. Of the 160 above referred to, 100 were redheads, twenty canvas backs, remainder principally blackheads.

On Nov. 12th, ducks sold at Havre de Grace, first hands, canvas backs, $1.60 to $2.00 per pair; redheads, 60 to 80 cents; blackheads, 30 to 40 cents. By many, redheads and blackheads are thought to be quite as good eating as canvas backs. One may see from these figures, why these men charge such enormous prices, viz.:—from $25 to $100 per day, (about $40 being the usual price for really good men in good weather). There are about forty licensed sink-boxes, with prices varying according to *season*, weather, and shooting abilities of the men, from $15 to $100.

The first days of the season, all things being equal, are the best, as the ducks become more and more shy. Mondays is probably a better day than any other of the week, as they have two day's rest, instead of one, until after the 1st of January, when Saturday becomes a shooting day.

I was unfortunate in having selected a very unenergetic man, who feigned sickness, or was too lazy to go to the shooter when signalled.

On both days large bodies of floating grass fouled the decoys to such an extent that it was necessary to take them up and reset them, by which, much time was lost. If I was going again I should employ a man by the name of Seighthizer, who charges $40, he is an excellent shot, and a live, active man.

There is a man by the name of Dobson who is said to be the best shot among the professionals. Jones, the proprietor of the Harford House, could probably furnish the names of many others, and of all prices. A party of two, three or four could find enough to amuse them for a day in one of these expeditions. One of the party might "bushwhack," which is a kind of "sneak boat," or ordinary batteau, with a curtain around the bow to conceal shooter and sculler. These men have fifty decoys set out; stand off and scull when ducks alight. More canvas-backs can be shot in this way on calm days than from the sink-box. These men charge much less; probably $10 to $15. If economy is to be studied, Chesapeake is to be scrupulously avoided, Barnegat and Brigantine being better places, where $8 per day will cover all expenses. My two days on Chesapeake cost me, all included, $110. No license is needed to shoot from the boats or boxes of professionals, but to shoot from the shore, which may be done on all days, I should think it would be needed. Policemen are stationed in cabins to enforce the laws. "Point shooting" is for the most part monopolized by clubs, some of which have small houses. The shares in some of these clubs cost $1,000. The nearest public house to the Point shooting is, I am told, at Edgewood, ten miles beyond Havre de Grace, on same line of railroad.

Persons engaging professional gunners should have some written memoranda of what they are expected to do; how many decoys they are to put out; that they are to be ready to shoot one hour before sunrise, or as soon as it is light enough to see, and not to take up until after sunset; to keep the decoys clear of grass; to come to shooter as often as signalled; to carry a gun with them to kill cripples in their journeys to the box; to have something fit to eat aboard, such as coffee, sugar, butter, milk, beef, etc. Inquire into the condition of their larder before going aboard.

The outfit should be visited before engaged. One should stay at hotel until 3 o'clock in the morning, and then go aboard, as the accommodations are simply beastly. If there is a likelihood of a calm morning, necessitating the towing of the sloop by the men in the batteau, this should also be provided for in the contract, obliging the men to be on the ground before sunrise.

To illustrate the importance of such a contract, I will detail the following experience: Of the three men promised, one turned out to be a small boy—one of the irrepressibles. His father, the "boss," feigned sickness, and only by the most persistent urging did they perform their duties. On neither day did they put out all their decoys. On both days they insisted upon taking up very early. Our rations were salt ham; one day no butter—the other no sugar; seldom carried a gun to kill cripples, and then, though they had two breech-loaders, he proposed to use a muzzle-loader to save ammunition: and all this in the face of a fee of $33 per day.

J. S. H.

DUCK SHOOTING ON DELAWARE BAY.

Our party, consisting of Capt. R. G. Wilkins, Morris Clark, John Mayberry, William Patton and the writer, left Cooper's Point, N. J., on the 5th of November for a trip down the bay. As we thoroughly understood each other, having all "been there before," we resolved to make the trip a thoroughly enjoyable affair.

After encountering rain, snow and a dense fog, we arrived at Back Creek (seventy-one miles) on the evening of the 7th, and came to anchor directly upon a bed of as fine oysters as ever tickled the palate of an epicure. On the morning of the 8th we set our gill-net on the ebb tide, and took out about four dozen black-back perch and rockfish, and on the last hour of the ebb tide tongued up about six bushels of oysters. About three o'clock put out our decoys, and had splendid shooting until dark at black ducks, mallards, broad-bills and teal, and certainly feasted upon "the fat of the land" and water.

The weather continued mild for more than a week, and as we had more ducks than we could consume, shipped a barrelful up by a passing oyster pungee. We had ducks "stuffed" with oysters and roasted, duck stews, duck fries, and ducks in every shape eatable, and yet many of our ducks spoiled, and had to be thrown overboard. For about ten days the weather was so mild that a coat and vest were burdensome, and the mosquitos annoyed us to such an extent, that for two days we did not go on the marsh. Our gill-nets averaged about nine dozen fine perch and rock each day, and after catering to our own table we had plenty to share among the oystermen whom we met now and then.

At last the long-looked for change in the weather came about. The wind shifted to northwest and blew a gale, accompanied by a heavy flurry of snow. Our little yacht was snug enough in the creek, but the gale increased to such an extent, that we had to get out two extra anchors, and these did not hold her for some time, and after dragging about a hundred yards, we fetched up under the lee of a high mud-bank. The wind continued heavy for two days, driving the ducks out of the bay, inland. On the third day the wind lulled, and Clark and I took one of our ducking skiffs and pulled up to the "Tweed" (seven miles), put out the decoys, and pushing the skiff into a bunch of high grass, prepared for business. The sun was almost down, and flock after flock of black ducks and mallards passed over our heads. When the light became uncertain the ducks flew closer, evidently attracted by the decoys, and—whiz! a bunch of mallards whirled over the decoys with the speed of lightning.

"Steady, now," said I; "they'll be back again;" and before I finished speaking down they flopped just outside the decoys, and about thirty yards distant.

"Shoot!" said I; and bang! bang! bang! bang! four barrels belched forth their contents. We picked up nineteen dead ducks; three cripples crawled into the grass, which we also secured, and two more, wing-broken, fell into the water, which I shot over with a small gun. Just as we were about to take up the decoys a small bunch of teal whirled by us, when Clark picked up the small gun and sent two loads of No. 6 after them, which brought down three stone dead. It was a beautiful shot. We had in all twenty-seven, and our little boat was literally loaded down with ducks. These birds were all in splendid condition—fat, juicy and tender.

We were stooling off Back Creek Point one afternoon, when Mayberry shot into a bunch of black ducks apparently far out of gunshot, and directly over his head. I watched them for awhile, when I saw one lag, and shortly afterward, fall into the bay about a mile from shore. An hour afterwards we picked it up drifting by our decoys, the wind and tide having set it ashore.

The same afternoon Captain Wilkins was shooting off Ben Davies' Point, and shot at a broadbill; the duck flew at least 200 yards out into the bay, then wheeled and flew shoreward, and dropped dead on the marsh not six feet from his blind.

I was stooling one evening about dusk at "Leather-Belly" ponds, when a bunch of mallards went past me; I stopped one, and as it struck the water it went down; in a moment afterwards I heard a slight pattering, and peeping cautiously in the direction of the sound, saw the crippled duck walking towards my blind; it came directly to me and I caught it by the leg. I mention these incidents as singular, and can vouch for their truth.

We all performed our share of hard work on the trip. Captain Wilkins was sailing master; Patton did the cooking, and the other three helped to supply the larder. Many little jokes might be mentioned, which helped to enliven the time and add to our pleasure.

Coming to an anchor on one occasion, Wilkins shouted to Patton to let go the anchor. As the yacht went up in the wind, Patton let it go, by going down to the bottom with it (one of the flukes caught in his knit jacket and carried him overboard). Cap walked forward and met Patton climbing up over the rail, looking like a veritable drowned rat.

"A-a-anchor all r-r-right, Cap; I've b-b-been there," said Patton, as he wiped the salt water off his lips.

We had a late supper that night, and the cook went without his grog for his unseamanlike conduct.

Patton "got square" with the Captain. One afternoon Wilkins was crossing a spongy place on the marsh, when he slipped into a "salt hole" with both feet far above the tops of his gum boots, and stuck there.

"W-w-what are you d-d-doing down there, Cap?" asked Patton, with a wicked twinkle in his eye, and, deliberately lighting his pipe, marched off to the yacht to tell the boys the joke. Six hours (so Wilkins said) afterwards Patton came along and pulled the Captain out of the hole, and plumed himself on having performed a kindly Christian act.

The next day, the weather continuing cold, with wind from northeast, put everything aboard and stood down along Egg Harbor, when we crossed the bay (twenty-five miles) to the breakwater under Cape Henlopen, with a heavy sea, under three-reefed mainsail, with jib stowed. Passed Brandywine Shoal Light and anchored under lee of the "Stone-pile," where we found 174 weather-bound vessels of all sorts and sizes. Stopped here two days, when the wind shifted and sea calmed down. It is a sad sight to look along the iron-bound beach and see the number of wrecks strewed there.

Got under way at daylight of [the third day; doubled the cape, and stood out towards the "great briny." The long, regular swell brought new life into our bodies, and in a few hours we crossed the bar at Indian River, and entered Rehaboth Bay, 155 miles from the starting-point. This is the home of wild geese. Our old friend Benson, once proprietor of the Ashland House, Philadelphia, used to send from this place tons of wild geese, brant and ducks some years ago, with but one man to assist him—the eccentric Doebler, of Lewes. The wind having "chopped"

around to northeast, out the tides out and "sanded up" the inlet, and we became for a time completely landlocked.

As the foregoing is enough for one issue of your valuable paper, I shall endeavor to finish this sketch in another article. COMMODORE.

Fish Culture.

FISH CULTURE IN MAINE.—We have had this in our pigeon-hole a long time. It is now just as good as it ever was. It is an extract from the address of Dr. Geo. W. Martin, of Augusta, Me., before the Kennebec Association for the Protection of Fish and Game:—

I believe water—neglected, ill used water—if properly tilled, to be much more valuable than land, through its greater productive powers—powers which are greater because we have a combination of two elements, both land and water, helping and encouraging each other in the work of reproduction—and where the best species of fish, as salmon and trout, can be cultivated, it is capable of yielding a revenue very far exceeding that of land alone. Francis Francis, the leading fish-culturist of England, who has been years in the business, says: "Two or twenty, or two hundred acres of water will produce double the weight of animal food that two, twenty, or two hundred acres of land will, if as carefully tilled, and with this striking difference—that in case of the production, as regards land, there are very heavy working and other expenses; in the case of water there are comparatively few. Fish, even if left to themselves, will eat and grow, and nature will provide the means of sustenance, without either barn or stables, teams or fences, seeds or farming implements, or even draining. Fish are our own produce, and worth so much per pound in the market on any day we like to sell them, and if we do not sell them, why we shall not lose by keeping them, for they cost us no money to feed, as do bullocks or sheep. If we have enough to export, they are a source of exchange and wealth, and will relieve our over taxed industry; or, at least, the effect of a large introduction of fish into our home provision-markets would speedily influence the price of every other production."

Maine has the finest system of lakes, ponds, rivers and brooks in the world, covering an area of 2,048,000 square acres of inland water, and well suited to the production of fish—capable of producing food equal to half a million acres of the most fertile land in the State. In fact, before our rivers were obstructed by dams and our fish butchered on their spawning-beds and destroyed by nets, our rivers were swarming with elegant food-fish—salmon, trout, shad and alewives were abundant. The question that most concerns us is, can our fish be restored? Yes. But 1st, fish-ways must be built over our dams, and exhausted waters restocked with migratory fish. 2d, our fish must be protected during their time of breeding. To show what can be done in the way of restocking rivers, I will refer to the river Galway in Ireland. I quote from official reports. "The salmon fisheries of the Galway are owned by Thomas Ashworth, who came into possession of them in 1852. They were in an exhausted condition. Mr. Ashworth had good fish-ways built over the dams, had the fishing restricted, and protection given to the fish on their breeding grounds. The result was that the catch of salmon rose in ten years from 1,000 to 20,000," and Mr. Ashworth made a fortune out of his private enterprise. The river Tay, in Scotland, shows a similar result. Trout eggs were carried, a few years ago, from England to far off Australia and planted in waters where trout were unknown. To-day some trout are taken there weighing six and eight pounds, and smaller ones are caught in great numbers.

Official statistics show that the salmon fisheries of the Columbia River, in Oregon, are worth over $2,000,000 a year. I find by the U. S. Fish Commissioner's report for 1876, that R. D Hume, Wm. Hume, G. W. Hume and Joseph Hume, formerly from Augusta, did a business in canning salmon worth $750,000; and that A. S. Hapgood, another Augusta boy, put up $150,000 worth of salmon, making in all $900,000. The Kennebec was originally as good a salmon river, in proportion to its size, as the Columbia. There is no reason why the fisheries of the Kennebec, if properly developed, should not produce a revenue of half a million dollars. What we lack is suitable fish-ways for salmon, shad and alewives to go up our rivers where they can find gravel-beds on which to spawn. A few years of intelligent and well-directed work will accomplish wonders. Fish-ways *must* be built, and our nearly exhausted rivers must be restocked with salmon, etc.

In passing, I wish to say a word about our Fish and Game Laws, which are intended to protect fish and game during their breeding season, and, if properly observed, will make them more abundant. It is for the interest of every citizen of the State to obey these laws. Especially hotel keepers, railroad managers and stage owners; for it will increase travel, and of course, increase their profits. Sportsmen and people in search of recreation go where they can find fish and game. What would the Moosehead and Rangeley Lake travel be worth, were it not for the trout and game found in those regions? Protective laws especially benefit the "Pot hunters," who kill fish and game for profit; because they can catch more, with less labor, and at a time when it will bring a better market price; and thereby will reap a double profit. It is for the interest of every citizen to obey these laws; for it will make food cheaper and more plenty, and add to the wealth and resources of our State.

Fish are unfit to eat during their spawning season. They become poor; their flesh is soft and loses its peculiar color, and also loses its fine flavor. It is *positively unhealthy*—no more fit to eat than a setting hen, a cow that has just dropped a calf, or a sow with a litter of pigs. Did you ever catch a trout in the spring, or during the summer, when it is full of life and vigor? when it will make such a gallant fight for its existence? Do you remember how hard and red its flesh was, and its splendid flavor when cooked? Take the same trout in the fall from it spawning beds and it is as lazy as a chub—its vigor is gone; its flesh is soft and pale; itis insipid and tasteless—no better than a sucker.

Gentlemen, if I have succeeded in awakening an interest n the subject of fish-culture, and called your attention to he great sources of wealth in our inland waters, I am satisfied. There are more treasures to be found in our countless lakes, grand rivers and dashing brooks, when looked for by the light of science, than were ever found by Aladdin with his wonderful lamp? Why look for gold on the Pacific shore, or delve for hidden palaces among the buried cities of Yucatan, when there are such stores of wealth in our bright waters.

HOW OYSTERS ARE FATTENED.—The oysters obtained from Tangier Sound, Lynnhaven, and what are known as the seaside oysters, are a rather small oyster, enclosed in an immense shell—their native element being salt water. These oysters, when dredged and brought to the Baltimore market, are sold to the packers and others at the rate of about sixty cents a bushel.

Recently a plan has been discovered by which these oysters can be not only fattened in a very short time, but their value enhanced at least 150 per cent. Two of the large packing firms are now engaged in this business, and the manner of procedure is decribed as follows by one who has watched the operation:—

"When the oysters are unloaded from the pungies they are transferred to scows, over which a deck is built, and on which deck the oysters are placed. Each of these scows will carry a deck load of about 600 bushels of oysters. The scows are then towed to a point in the Patapsco River, near the Ferry Bar Bridge, where the water is quite shallow.

"The vacant space in the scow, between the deck and the bottom, is filled with water by means of a valve, and the scow is sunk. There she is left during two flood tides, when the water is pumped from her by means of a small machine provided for the purpose, and the scows are then towed up to the city again.

"The change from the salt to the fresh water, and the immersion of the oyster during these flood tides, it is said, fatten them until what was at first but a comparatively insignificant oyster becomes a plump and luscious bivalve, filling its immense shell.

"After this operation, the oysters, which, as stated, cost originally about sixty cents a bushel, are placed on the market, and readily command $1.50 to $1.69 a bushel."

Recently there were seven scow loads of these oysters immersed, and the firms engaged in the business have twelve scows constantly employed. The whole operation is under the supervision of one man, who undertakes the fattening for a consideration of ten cents a bushel, the firms furnishing the appliances.—*Queens County Safeguard.*

ACCIDENTAL TAUTOG CULTURE.—The Newport (R. I.) *News* accounts for the presence of tautog in Cape Cod Bay, Mass., in this way: "It is about twenty years since the first tautog was taken in Cape Cod Bay. About twenty-one years ago a fishing-smack sailed from Long Island with her well filled with live tautog. She was wrecked on Race Point, near Provincetown, and the fish escaped. This is believed to be the manner in which this species was first introduced in these waters. They are taken now around the rocks and on the ledges in all of the Cape towns." That was bread cast upon the waters and returning after many days.

TROUT FRY.—As will be seen in our advertising columns, fish culturists have a rare opportunity of securing yearling trout fry from the fish farm of the Thompson Brothers at New Hope, Pa. This establishment is one of the best equipped and most intelligently managed in the country.

Sea and River Fishing.

FISH IN SEASON IN DECEMBER.

FRESH WATER.	
Black Bass, *Micropterus salmoides; M. nigricans.*	Pike or Pickerel, *Esox lucius.*
Sea Bass, *Sciænops ocellatus.*	Yellow Perch, *Perca flavescens.*
	White Perch, *Morone americana.*

THE GLOUCESTER FISHERAGE LOSS.—The statistics annually published by the *Cape Ann Advertiser*, Gloucester, Mass., of the losses of life during the year, possesses a pathetic interest. With the review of the year always comes a summing up of the number of poor fellows who have gone down in the sinking ships, and this is a more melancholy record than that of any other industry. The year 1879 has been an exceptionally disastrous one, scarcely a week having passed without some calamity. Thirteen vessels went down, 143 men were drowned, 56 women were widowed, and 150 children left defenceless in a single February gale. So overwhelming a calamity could not fail to awaken a generous sympathy, and $28,-216.72 was contributed to feed and clothe and shelter the bereaved and helpless survivors of the lost mariners. The February gale, however, furnishes but a part of the direful history of the fisheries in 1879. In all thirty vessels, comprising over a tenth part of Gloucester's fishing tonnage—valued at $118,789, nearly all of which was insured on the mutual system, and is therefore a direct loss of working capital—sailed to return no more, and 342 lives have been lost, leaving 88 widows and 219 fatherless children.

—Dr. L. R. Hungerford, of the firm of Williams & Hungerford, of Hartford, Conn., will leave for Florida next week, intending to spend a portion of the winter near Enterprise on the St. John's River. He will take the canvas boat with him which Mr. T. Sedgwick Steele used on his trip through the wilds of Maine last summer.

—MOVEMENTS OF THE FISHING FLEET.—Only two Bank arrivals have been reported at this port the past week, with 13,000 pounds halibut. The number of Georges arrivals has been nine, bringing 126,000 pounds codfish and 3,600 pounds halibut. Whole number of arrivals for the week, eleven; total receipts, 126,000 pounds codfish, 16,-000 pounds halibut.—*Cape Ann Advertiser, Dec. 13th.*

—Joaquin Miller has been writing to the *Independen* of trout fishing in the Sierra Nevadas.

FISH SWALLOWING FISH.

THE contest for our big fish hook, offered for the best story of one fish swallowing another, is lively. Every man entered is equipped with the very best tackle. Each one is bringing into play his deftest skill, and he who comes out "high hook" must prove himself an expert of no mean renown. The series of stories already evolved and now evolving is, we venture to say, the most unique in American sporting literature. Our numerous angling friends are again admonished that the competition closes January 1st, 1880. All letters mailed before that date will be admitted. The following stories are fair to middling. No one of them is just what we are looking for. Who has that story? The big hook has not been awarded. Next week's instalment will simply amaze and mystify. But sufficient unto this week are the stories thereof. Here they are:—

BOSTON, *Dec. 12th.*

Editor Forest and Stream:—

Last summer, on one of my excursions on the Cape, Capt. Jenkins and myself went for a day's bassing on Triangle Pond, Sandwich. Unfortunately it was one of those days when, nothing would coax the fickle bass, and we were unsuccessful; caught several good sized perch, but no bass. Upon our return to the landing with the boat, we of course doubted stories we had heard of the plentifulness of bass in this particular pond, which by the way had been stocked some eight or ten years previously and was just the place, everything considered, for a good day's sport. Our boatman informed us that we were simply unlucky in the day, for the fish were plenty, only capricious, and we were unfortunate. During our conversation he informed us that about a week previous he found, a few rods below the landing place, a pickerel dead upon the shore, with a black bass partially swallowed, so far down, head first, as to suffocate the pickerel. The bass weighed over three pounds; the pickerel six and a half. S.

CLEVELAND, O., *Dec. 12th.*

Editor Forest and Stream:—

In this locality, when I was a boy, every one went fishing and shooting. In fact, in those early days, when game and fish were plenty and free to all, every boy carried a gun on one shoulder, a fish pole on the other, and at the same time was extremely expert in running away from school. Fishing one Saturday afternoon on the "Old River Bed," fish plenty and biting freely, we soon ran out of worms. The boys would lend me none, so we just took the eye out of a straw bass, for bait on our hook. While so doing the fish slipped and flopped back into the water. Within a minute we caught that same fish with his own eye. Unfortunately the eye slipped off the hook and was lost. So all we had to do was to pull out the other eye for bait, and as bad luck would have it, for us, that lucky eyeless fish just flopped out of our hands the second time into the water. But within less than another minute a big red-headed boy on the "flood wood log," next to us, pulled out that same identical straw bass minus his two eyes. DR. E. STERLING.

MANCHESTER, VT., *Dec. 8th.*

I notice your offer of "a big hook;" now I have any quantity of hooks, but don't object to a big one for a sign. So I will tell you "a little story."

About thirty years ago I was fishing up a small mountain stream for trout; there were plenty of them, but quite small. The bushes were thick and there was no chance to "cast a fly," so I was fishing with worms, but soon got out of them and went to using the eyes of the trout for bait, which they took quite as freely as the worms. After taking quite a number this way, I caught one some five inches long, and as I took him off my hook I drew the hook into one of his eyes and pulled it out for a fresh bait (a cruel thing as it looks to me now), and in putting him into my coat pocket, (had no basket) he slipped out of my hand and fell into the water at my feet and swam out in front of me about the length of my short rod and stopped short. I thought I would try him again, as he had one eye left. So I put the hook with his own eye on it immediately in front of his nose and he took it instantly, and I caught him and saved him.

You may be sure I was astonished to get him again, and examined him carefully, and there was no mistake, it was the same one—one eye gone from the same side—freshly torn out, and there could be no mistake, as I did not lose sight of him from the time he went from under my feet until I had him again, in less than one half a minute.

Now this proves to me two things: 1. That I shall have the "big hook." 2. That fishes are not much sensible to pain, and Mr. Bergh has no call to bother us fishermen. C. F. ORVIS.

ALBANY, N. Y., *Dec. 7th.*

Editor Forest and Stream:—

In my younger days I had often heard what fine sport it was to catch trout on the fly; so one cloudy morning in June, I started for a neighboring brook, equipped for the occasion. Arriving there just after sun-up, I chose a favorable pool and made my first cast. To my surprise a fine trout darted at it, and just when he seemed to be in reach of it, turned like a flash, aiming a blow with his caudal appendage at my fly. Very much surprised, and being a ball player, I scored one strike and tried it again, with like results. By this time I became convinced that I did not give him a chance, so cast again a little slower. Now, that fish was either frenzied with hunger or else desperate after his repeated failures, for with one mighty rush and slap, he shot that fly in his throat, and so great was the force that he swallowed himself, tail end first, and before I could recover from my astonishment there were two more fish on my flies, making three in all—one on each hook and the desperate specimen, inverted, strung on my leader. Carefully drawing the exhausted trio to the bank, I sorrowfully wended my way homeward, thinking what a horrible thing it would be to fall in among a school of trout and have your brains knocked out with their tails before you could recover. And from that moment I vowed allegiance to the black bass, and have maintained it to this day. DEXTER.

Some of the greatest failures in this world are those of men who fritter away their lives in vain attempts to build an insufficient foundation. Had "Dexter" started out with a larger species of fish he could have had a respectably magnificent yarn.

CHICAGO, Ill., *Dec. 7th.*

Editor Forest and Stream:—

If Jim Hitchcock, of Oconomowoc, has not already told the story which entitles him to the hook, he has the story on hand, and I know it. Jim is bound to draw that prize, if it takes him a year and a half. As for the story to'd by him in last week's paper, it was a good one, and was true, being vouched for by a most truthful and very estimable lady. Still James does not require vouchers for his veracity; anybody will take his word, or his note either, for that matter. For the following, which is the story upon which James expects to get the prize, I have not only his word, but I saw the occurrence myself, from the porch of my house on the banks of La Belle Lake.

H. and a friend from New York, equipped and provided according to law, made an early start one summer morning in pursuit of the black bass and green bass of La Belle. They fished with fair success for some hours up and down the lake. Upon rounding Long Island, and entering the bay above, Jim came to a spot which he knew to be the home of the grandfather of all the bass in the lake. He was an old ripper. He had tackled him on two previous occasions, and each time had succeeded in losing the fish; but on this day he had made special preparations; his rod, reel, line and barbless hook, were perfect, and he wanted that bass. He weighed at least six pounds, and come out of the water he must.

James made a cast, the minnow fell upon the water sixty feet away; no rise; he reeled in his line for another; just a little to the left the minnow fell again. The water boiled and surged for an instant; the minnow disappeared and the reel spun like a buzz saw. A twitch of the rod just enough to set the hook, and James said he had him, and he did have him theoretically, for just then the bass leaped out of the water to see, I suppose, what kind of a fellow had that rod in his hand. Satisfied that he had no green horn to deal with, he struck at the line with his tail as he went down, but missed his mark and found that unpleasant hook still in his mouth. It now became a contest between James and the bass, in which James was rapidly getting the best of the fish. A hundred feet of line would run out in about five seconds, then being somewhat checked by the heavy draught the bass would turn and make a bee-line for the boat twice as fast as the reel could take the line up, straight under the boat, out the other side and off for another hundred feet in the opposite direction. These tactics were kept up for fully half an hour, and still the fish was no nearer a captive than when he first struck, except that he showed less vigor in his rushes to and fro. James began to sweat. The bass changed his plan and went straight down in the deep water immediately under the boat, then he sulked and no amount of persuasion could stir him an inch. Suddenly the bass made a grand rush for the surface, reached it, and shot off like an arrow more than one hundred feet before he could be checked, but the pressure on the reel fetched him at last. Jim knew that it was the grand final attempt at escape. And when he commenced reeling him in, was sure he had his bass—the fellow he had been looking for so long. Inch by inch and foot by foot the reel took up the line, fifty feet, twenty-five feet. The old fellow turned upon his side; bright and shiny it was; and he was a veritable monster; over six pounds, sure. What a prize! The last turn was given to the reel, the landing net was carefully advanced below the fish, and—came up, with nothing in it but the hook. At the last moment that bass had swallowed himself. This was Jim's explanation of it, and I have no doubt it was true, because I have never seen that bass in the lake since.

Send that hook to J. C. Hitchcock, Oconomonoc, Wis.

GEO. A. SHUFELDT.

The size of the bass to be sure counts something in this well-told narrative, but we can bring forward any number of men right here on Manhattan Island who have seen one big fish begin to swallow another big fish, the second big fish also attempt to swallow the first, and, each swallowing the other, both disappear. The hook will, *not*, therefore, go to Wisconsin.

SAVANNAH, Tenn., *Dec. 7th.*

Editor of Forest and Stream:

Several years ago a party of gentlemen were fishing for bass on one of the many tributaries of the Tennessee River. Owing to the carelessness of one of the party, their bucket nearly full of minnows was dropped into the stream and lost. Four years afterward one of the party chanced to be fishing near the spot where the bucket had been lost, and caught a catfish of the yellow variety, about twenty inches in length. A somewhat unusual rotundity in the abdominal region of the fish provoked attention, and led to the angler's making an immediate dissection. Somewhat to his surprise, among the miscellaneous contents of the fish's stomach he discovered the long-lost minnow bucket. Now had this been all, there would have been no cause for my troubling the readers of your journal. For if a northern pickerel, four inches long, can swallow another measuring as many feet, what is there strange in a southern catfish taking in a medium sized tin bucket. But inside the bucket he discovered a brook chub, which after having devoured its fellow captives had grown to the size and shape of its enforced prison house, and portions of its body were protruding through every perforation of the top and sides of its close tin case.

A. L. Y.

This has the "piece of chalk" indefiniteness. How big was the bucket? And what is the mystic meaning of those initials?

SHANKS, O., *Dec. 12th.*

Editor Forest and Stream:—

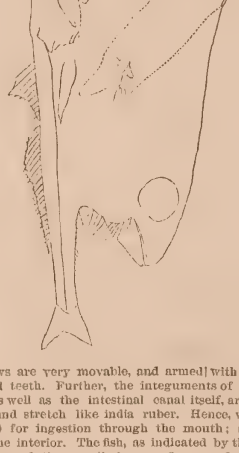
The following incident came under my observation a few years since, in the State of West Virginia, which was at that time my home. A line with baited hooks attached at intervals was stretched across Middle Island Creek. The owner repaired to his fishing grounds one morning for the purpose of examining the line and rebaiting the hooks. Arriving on the bluff bank of the creek, he observed a commotion in the water near the line, and about the middle of the stream. A careful look discovered a very large pike near the surface of the water, apparently fastened on a hook, and making some effort to free himself. Fearing, from the size of the fish, that he might break something and escape, the fishermen raised his rifle, took a quick aim, and fired; and soon had the satisfaction of seeing the fish turn up and lie quivering in the water. Upon rowing in to the spot, he found that a pike two feet long had been hooked, and afterward swallowed to the gill by another pike (the one he had seen and shot from the shore) measuring four and a half feet, which was trying to make off with his prey, when the rifle shot stopped him.

A. ORR.

WALKERTON, Ontario, *Dec. 8th.*

Editor Forest and Stream:—

I send you the following, and am under the impression that it is the story you are waiting for. After reading it I am sure the authors of the stories already published will abandon all claim to the hook, and smile at their efforts in romance:—"Now the Lord prepared a great fish to swallow up Jonah," "And Jonah was in the belly of the fish three days and three nights," "And the Lord spake unto the fish and it vomited out Jonah upon the dry land."



GUNNER.

"Gunner" is informed that the above story is a gross plagiarism. We thought when we read his manuscript that we had seen the same thing somewhere before, and upon consulting the librarian of the Astor Library we were referred to a very ancient book, originally written in Hebrew and since translated into hundreds of different languages. We find in the English translation of the book the same story, word for word, as "Gunner" has sent it to us. He may, therefore, not hope for the fish-hook; that prize is to be awarded to the best *original* story. If our Ontario friend thought to impose upon any supposed lack in this office of familiarity with general literature, he may now profitably reflect upon the illusory sheen of fish hooks gilded with great expectations. All is not gold that glitters; nor is the bait always the poor worm it seems to be.

By the way—after our contributors have wound up their reels and put aside their pens, we shall treat all hands to a fish supper, of which the bill of fare, printed in many languages, shall contain varieties from the streams of fiction in every age and clime.

THE GREAT SWALLOWER—*Chiasmodon niger*.—In accordance with my promise, I herewith furnish more information relative to the fish which swallows others several times larger than itself, referred to in FOREST AND STREAM for Nov. 6th, 1879, (Vol. 13, p. 795).

The species designated *Chiasmodon niger*, has an elongated form; no scales; two dorsal fins, one short and the other long; and the head is conic and pointed, and has a very deep mouth. The fish has been referred to the family of Gadidæ—i. e. associated with the codfishes—but probably is the type of a peculiar one, although nearly related to the Gadids. The mouth is not only deeply split,

but the jaws are very movable, and armed with large backward curved teeth. Further, the integuments of the abdominal cavity as well as the intestinal canal itself, are extremely distensible and stretch like india rubber. Hence, we have due provision (1) for ingestion through the mouth; (2) for storage within the interior. The fish, as indicated by the structure and armature of the mouth, is very fierce and voracious as as well as bold. It consequently attacks others much larger than itself; runs them down, seizes them by the tail, and having once secured a hold, *climbs over them*, (gets on the outside of them.—ED.), as it were, by alternate movements of the upper and lower jaws; the distensibility of the integuments enables it to complete the work and to get outside of an animal which will weigh several times more than itself would weigh with an empty stomach. Any one who has seen a snake swallowing a rat or mouse can readily appreciate how the work of ingestion in the fish is effected.

But excessive greediness generally carries with it its own punishment in some form or other. Our great swallower is a case in point. Although it is capable of such feats it is not exempt from the laws governing matter. The big fish may be entirely and compactly stored within the cavity of the little one—and in an almost uninjured state, too—but the struggling of the victim and the gases of putrefaction subsequently evolved, may lead to fatal results. The consequences are (1) that the belly turns upwards and the fish is unable to control its movements, and (2) on account of the helplessness and buoyancy thus induced, it is carried from the depths which it normally inhabits into the upper regions and floats upon the surface.

As the result of the greediness in question the only specimens of the species hitherto obtained have been secured. One was taken in the month of March off the Island of Madeira, and described by Mr. J. Y. Johnson, in Proceedings Zöological Society, London, for 1863, (pp. 408-440), and another while helplessly floating was picked up near the West India Island of Dominica, and has been described and illustrated in Proceedings Zöological Society, London, for 1866, (pp. 35-39, pl. 2). The Madeiran specimen was three and seventh-tenth inches long, and "its stomach contained the doubled-up body of an entire fish nearly twice its own length. The latter proved to be a specimen of *Gonostoma denudatum*, Bp.". The Dominican fish had a "total length from snout to extremity of tail" of 6½ inches, and "the length of the enclosed fish (*Scopelus macrolepidotus*)," was 10¼ inches. In both cases the fish swallowed was not only longer, but comparatively higher, broader and therefore stouter than the swallower, and consequently must have weighed a number of times more than the swallower.

I send an outline of the specimen caught near Dominica, showing how the stomach and abdominal integuments are dilated and the ventral and anal fins displaced.

In conclusion, I shall only add that although the above noted are the most remarkable swallowers I know of, there are a number of species which are capable of great feats in the same line. Such are the deep sea anglers, of the family of Ceratiids, and our own surface angler, or "goose fish" (*Lophius piscatorius*).

THEO. GILL.

Smithsonian Institute, Washington, D. C.

DETROIT, Mich., *Dec. 9th.*

Editor Forest and Stream:—

Now, as I understand it, a fish story is a tale that is unreliable, "fishy," *liable* to be untrue. So two incidents that came under my observation would not enter into competition for the gilded, great hook, as they are strictly true. But I will relate them. Detroit is near that great fishing ground, the St. Clair Flats. Bright and early in the morning we started out with a pail of fine minnows, and at our first anchorage we found we had struck it big, and would have royal sport. We were just "snaking" in the black bass; had caught perhaps a dozen or fifteen, running in weight from two to five pounds, when the lubber with me made one of the graceful movements in the boat, for which his species are noted, and overboard he went, and with him went over our pail of minnows. After some difficulty I fished him out and secured the pail, but, alas, the minnows were gone. Now, here was a pretty kettle of fish. No bait and such a magnificent chance for sport before us. A moment's reflection and off we started for shallow water. When we reached it I got out and went striking through the weeds with my little scoop for more minnows. I had not been wading more than five minutes before I got my leg tangled in something that felt like a coil of rope. I stopped to examine it, and what do you suppose it was? Nothing more nor less than one of those piratical fish, a large grass pike, which had actually undertaken to swallow himself! He had commenced with the tail part and had six or eight inches gorged, thus making a hoop of himself, and I had put my foot in it. Being disturbed in his repast he made a desparate convulsive effort to get another bite before he got away from himself, and in so doing had shortened up on that part yet out doors and thus firmly imprisoned my leg. The beast! His shark-like teeth and the tight fit of his delicate morsel prevented me from untying him, and we had to cut him in two with a jack knife. Our scales told us that the cannibal weighed eleven and a half pounds. This is actually true, so no hook for that.

Sometimes, late in the season, we go "bobbing." The manner is this: we take large bladders, which we get from some slaughter house, and when we reach the fishing ground—some quiet and deep pool with little or no current—the bladders are inflated and a hook, with line four to eight feet long, attached, baited and cast into the water. Often we have fifteen or twenty of these to each boat. When a fish bites it is shown by the bladder bobbing up and down, and away we go to haul him in. Now, on this particular occasion, one of our bobs went out of sight like a flash and we vainly looked for it to appear again. We watched until tired out, and finally gave it up as lost, supposing some monster of the deep had gone to sea with it or tangled the line in weeds or snags, entirely out of sight. Some twenty or thirty minutes afterward, nearly in the center of the pond there arose to the surface a very strange looking object. We proceeded to investigate, but it was so hideous looking, neither would go near it for sometime; however, we finally mustered up courage enough to get it into the boat. It was alive, but helpless, and had the color, scales, fins, head, eyes and mouth of the pike, but, oh, my! what a shape. From tip of nose to end of tail it must have measured about ten inches, and the circumference of its body could not have been less than thirty or thirty-five inches at its middle. We finally concluded it was a pike and that it had swallowed something which so unnaturally distended its body. So we butchered him and held post mortem examination, and what do you imagine we found? Our bladder. The voracious fool had snapped at it while inflated and floating on the surface of the water, and we presume punctured the skin with one of his sharp teeth and it collapsed, then taking it under the water with him made a meal of it. But he disposed of it in his stomach in bad shape, and the action of his breathing apparatus again inflated it. The more he breathed the worse the matter became, until he finally lost all control of himself and rose to the surface and could not again descend, or even swim along on the surface. We presume if this circumstance had taken place in some coal oil country where the fool could have had gas to inflate his balloon with, we should have seen a new species of flying fish.

UNO.

"Uno's" is the most ingenious of all the automatic, noiseless, duplex, *ne plus ultra* stories of this series. The tale bears intrinsic evidence of its truthfulness. Had a man started out to spin the yarn he would have found no difficulty in getting the pike outside of the bladder, but how to distend the bladder again, would have staggered the ready tongue of the "orfulest" liar of the land.

NEW YORK, *Dec. 8th.*

Editor Forest and Stream:—

Several summers ago I was up in the Adirondacks with Dr. ——, whom you know quite well. One afternoon we made up a party and went trolling for pickerel. We divided into two boat loads and commenced our sport. The Doctor was rowing and I had my line out, when all of a sudden I felt a strike that would have gladdened the hearts of older fishermen than I am. The pickerel jumped about twenty feet out of the water, and then all at once my line slacked. Thinking he had got away, the Doctor rowed slowly for about a mile. By that time I thought I would look and see if my spoon was all right. Upon pulling the line in, I found that the pickerel—the weight of which I think must have been fully twenty pounds—had taken my spoon clean off the line. My sport was ended for that day, having only the one spoon. The strange part is to come. The following summer, Dr. —— and our families, as usual, again went to the Adirondacks. During our stay I heard one day of a party having caught a pickerel with a spoon in its mouth. I at once "interviewed" the man, and found that after one year the pickerel that had stolen my spoon had at last been brought to justice, with the evidence of his guilt, as it were, upon his person.

J. W. A., JR.

—Gen. Stoneman derides Gen. Fremont's scheme for turning the waters of the Colorado into the desert basin of California and Arizona. He says that, presuming the connecting canal to be 1,000 feet wide and ten deep, and running at five miles an hour, it would take 200 years to fill the basin. After being filled it would, he asserts, require an additional cutting of the same depth, and 350 feet wide to compensate for evaporation,

Natural History.

THE INTELLIGENCE OF FISH.—At a meeting of the Linnean Society of London, held Nov. 6th, Dr. F. Day read an interesting paper on this subject, in which he endeavored to show that this class of vertebrates possess a far higher order of intelligence than is usually credited to them. He said that biologists have given less attention to the faculties of fish than they have to other animals, and up to within a short time they have been regarded as totally lacking intelligence. This notion is opposed by Dr. Day, who claims that his experience and the observations of other writers indicate that fishes possess emotions and affections.

In support of this view he shows that they construct nests, transport and defend their eggs, protect their young, manifest their affection for each other, recognize human beings, can be tamed, show the emotions of fear, anger and revenge, utter sounds, hide from danger, seek protection by attaching themselves to the bodies of other animals, and have other peculiar modes of defence. He further states that they leave the water in search of food, and that they sometimes combine for attack and defence.

Quite *apropos* of this is a communication in a recent number of *Nature*, from Mr. J. E. Peal, on "The Voice in Fish." The writer when the observation was made was engaged in the survey of the Disang River, in Eastern Asam. Mr. Peal says:—"While seated in a small Rob Roy canoe, and very slowly drifting on the pool, I became aware of a number of large mahsir (*Barbes macrocephalus*) moving about in the water below and around me. Sitting perfectly still, I had the pleasure to see them gradually approach the surface and move about me at a foot or so distant, passing alongside, under and around the canoe, carefully examining it, bow and stern especially. It may not be easy to guess a fish's thoughts, but from the manner in which they examined my symmetrical gray-colored canoe, they appeared to think it might possibly be a large fish, and dead, of course. While watching their movements I was aware of a peculiar 'cluck,' or percussion sound, frequently repeated on all sides, and coming from below, but close to me. Eventually I found that this was made by the mahsir, and one, passing close along on my right, by itself, made several distinct sounds as it went on, that seemed answered by others to the left. If seated, say on the bank, the sound would be loud enough to be heard at forty feet distance. A large bivalve also is common in some parts of Eastern Asam that sings loudly in concert."

THE BLUE JAY IN THE EAST.—As is well known to all ornithologists, the blue jay is, in the New England and Middle States, one of the shyest of our birds, while in the West, in Ohio, Illinois and the Mississippi Valley, he is as tame and familiar as a cat-bird, and builds his nest in the front door yard, seeming to fear nothing from the presence of man. This state of things is due, of course, to the fact that in the East the bird is relentlessly pursued by the taxidermist and the small boy, while in the West game is more abundant, and the small boy shoots quails or ducks, while the taxidermist is, happily, far more sparingly distributed there than here.

Wilson Flagg, in the Cambridge (Mass.) *Tribune* gives some interesting remarks on this subject, which, for the benefit of our readers, we append:—

The question is often asked, why have the blue jays forsaken the woods and made their homes among the trees in our gardens and pleasure grounds? For several summers past these birds have increased in numbers in the very centre of our villages. The blue jay is a shy bird, whose natural habitat is the forest, where he feeds upon grubs, coccoons, beetles, caterpillars, the cereal grains, beachnuts and little birds' eggs. There is no want of food in the wild woods for his ample subsistence. Why, then, has he left the woods for the groves and trees in the suburbs of our towns and cities? The answer, I think, may be readily given. The blue jay, being a very intelligent bird, has discovered that there is perfect safety for him in the Botanic Garden, in Norton's Grove, in Hovey's Nurseries and in private pleasure grounds. In the wild wood, on the contrary, he is hunted and persecuted during the whole year by sportsmen and infantile gunners. His bright plumage and superior size make him a conspicuous object for the aim; and probably not one in a hundred of those incautious ones that remain in their primitive haunts escapes.

In our private grounds they are perfectly safe so long as they make no foraging excursions outside of them. They do but little mischief in their new resorts. I suspect them of robbing the nests of the vireo and linnets, and they may cause these and other interesting birds to flee to the woods which they have forsaken. It is a pity, I think, that they cannot gain access to the nests of the house sparrow, whose eggs and young would yield them a bountiful repast, and divert them from the nests of our native singing birds. I am disposed to protect the jays notwithstanding their predaceous habits.

Whenever I meet a party of young gunners, as I often do in my rambling excursions, I do not reprove them. "Go ahead," I say to them, "and kill every bird you can see, until our Legislature will do something better for their protection than to enact game laws that cannot be enforced." Then, again, I consider it idle to annoy young boys for following the example of their elders. Indeed, I feel a great deal of sympathy for them. The public ought to know that young people will follow these sports in spite of any laws that could be devised. That the only way to prevent the utter extermination of our interesting forest birds, and the equally interesting game birds of lakes and moorlands, is one which I have several times presented to the public, and that is, to establish forest conservatories all over the land, at the rate of one for each square degree of latitude and longitude. Each conservatory should embrace from five to six square miles of forest and pasture land, to be managed by a superintendent, where birds and other animals should find protection. I have no space here to enter into the details of my project. I have presented it once to our Massachusetts Legislature, but I am sure it will meet with no favor from that body until it has become a popular measure with the community. Legislative bodies follow the public; they do not lead.

RAVEN IN NEW YORK.—Through the courtesy of our friend, Mr. John B. Gilbert, whose valuable observations on the ornithology of Central New York are so well known to our readers, we are enabled to announce the capture of a specimen of *Corvus corax* near Penn Yan. Mr. Gilbert's note, dated Dec. 4th, states that the bird in question was killed by F. C. Hyatt, and that it is the first, so far as he knows, taken in that locality. We congratulate our correspondent on his prize.

THE NORTHERN WAXWING IN MINNESOTA—*Minneapolis, Minn., Dec.* 3, 1879.—The readers of the FOREST AND STREAM, will, no doubt, be interested to know that this locality has been visited the present season by the Northern Waxwing or Bohemian Chatterer (*Ampelis garrulus*) in considerable numbers. Rumors were afloat during the second week of November, of their having been seen a few miles from here; but they were not noticed by the writer previous to November 15. On that date a small flock was seen, and the day following they appeared in and about the city of Minneapolis in greater numbers than I have ever seen them before, and they have continued here up to the present time. The winter of 1875-76, is memorable as one of the few years of the appearance here in numbers of the waxwings; they came early in December, and remained all winter; but were most common toward spring, when they seemed to congregate at this point in numerous flocks of various sizes. They protracted their stay until late in Spring (April 25). They bid fair to be much more abundant this year than in '76.

Their food at present, is largely the berries of the mountain ash and the high-bush cranberry (*Viburnum opulus*) and something they find about the limbs and twigs of oak trees; but just what this latter kind of food is I have not yet determined. They are also fond of the berries of the Wolf or snow berry (*Symphoricarpus*) and of the common smilax. The preference, however, seems to be for the berries of the mountain ash; but as the supply in this locality is limited, the birds are soon forced to find other food.

The unusually early date of their arrival and their abundance this year, are the points to which the present note is designed to call attention.

By reports from various points a general idea of the time and extent of the southward movement of this interesting species could be obtained, and we should be glad to hear from observers in other parts of the United States where the waxwings might be expected to occur, as to whether they are, or are not, present—their absence being of interest as well as their presence.

T. S. ROBERTS.

THE POTATO BUG BIRD IDENTIFIED.—I wish to say something confirmatory of the information given by "W," from Coralville, Iowa, in FOREST AND STREAM of 20th ult. There are undoubtedly many—farmers and others—whose experience would be much more valuable than mine, but in the vicinity of St. Paul, Minnesota, I have often seen the birds engaged in feeding themselves and their young, just as described by "W," yet I have not seen them so acting at any great distance from groves or timber. I do not think "W" has overstated any of the good or pleasing qualities of the bird. It is not, however, the bunting suggested by the editor, and known as owhee, towhee, chowee, che-wing, joe-ree, etc., but is the rose breasted grosbeak, ("May his tribe increase,") and is the only bird of which I have any knowledge or information whose first choice in matter of diet is a fresh potato bug. Of such is its favorite meal, and it does not often call for dessert or condiments when its preferred game is in season. But few farmers and gardeners make themselves acquainted with their best friends, or the bird with the rose tinted bosom, would have his name inscribed well up towards the head of the list; so high, indeed, that our old friend, robin red breast, would have to put himself upon his good behavior, in order to retain his standing.

Pembina, D. T., Nov. 30th. M.

MINNESOTA—*Minneapolis, Nov. 24th.*—In your issue of November 20th, appeared a communication from a correspondent in Iowa, in regard to a certain bird eating the potato bug, or Colorado beetle. The bird in question is undoubtedly the rose breasted grosbeak (*Goniaphea ludoviciana*). The description given by your correspondent applies to this species, and the habit to which he calls attention has been noted in this locality by the writer and others for several years past. I have seen a number of these handsome birds in and about a single potato patch at once, and during the period, when the bugs are at work, the grosbeaks are regular frequenters of the potato field.

But the bugs are legion and the grosbeak's task becomes a mighty one. Yet he seems willing to do his part, and should be awarded the hearty thanks and firm friendship of the farmers he befriends. T. S. ROBERTS.

ILLINOIS—*Normal, Nov. 22d.*—The bird referred to in the interesting note of your correspondent at Coralville, Iowa, is doubtless our rose breasted grosbeak (*Guiraca ludoviciana*), the only bird which, in the critical examination of the contents of several hundred stomachs of birds, I have found to make a practice of eating the Colorado potato beetle. In fact, with the exception of a single specimen found in the stomach of a robin, I have not found this beetle in the stomach of any other bird.

This beautiful bird, as attractive for its clear, rich, and striking song as for its showy plumage, is increasing rapidly in numbers in this vicinity; but, hitherto I have credited it with good intentions respecting the potato pest rather than with any effective service. I am glad to learn that it is capable of becoming a real protection to the farmer's crop. Unfortunately, it offers temptations to the taxidermists—the pot hunters of ornithology—and is becoming too common in sets of fancy skins for the good of agriculture. S. A. FORBES.

State Lab. Nat. Hist., Normal, Ill.

WINTER BIRDS OF WYOMING LAKES—*Como, Wyo., Dec. 3d.*—During the summer and fall we have had no lack of bird life or bird songs around Como, but now "the time of the singing of birds" is over. The lake, which was clamorous day and night with the cries of wild fowl, is frozen nearly solid, and is as silent as the grave. I walked across its surface a few days ago, and the only living thing to be seen or heard was a solitary raven who hovered close over my head and croaked over this winding sheet of nature, eyeing me, as I thought, with some interest as to whether I might not slip in to some hole and make a banquet for him.

Now, if we wake at night, our ears are no longer greeted with the ceaseless coyeet! coyeeto! of the countless eared grebes speckling the waters or brooding upon their floating nests on its surface. Nor are we kept awake by the noisy wild geese or by the bittern mud-pumping in the reeds. These summer cries have changed for wilder music. Yap! yap! a hoo-o! with a chorus of demoniacal laughter from bands of coyotes coursing some luckless hare over the frozen prairie, now make "the voices" of our winter night, a sound wild beyond description, and in the far distance not altogether unmusical.

The last relic of summer birds appeared near our mine a few weeks ago, the common shrike, or *Lanius borealis*. A lonely bird he looked, with all his comrades, friends and foes, long since gone South for more genial climes. A relative of his, *Collurio excubitoroides*, we have had with us all the summer, in his coat of lincoln gray, and his antics in pursuit of small birds, beetles, etc., as well as his domestic relations, afforded us much amusement; a large family being located in a bush close to our quarry, the largest and most noisy family in the neighborhood, their cry seemed ever, "Give! give," and would not be satisfied.

On the thorns around the nest we found the butcher bird's shambles, beetles, mice, etc., carefully transfixed. On one occasion we found a small "horned toad," as the little grey lizard of the prairie is commonly called, impaled through the entire length of its body, with as much care as a taxerdermist might have employed.

But now even the *Lanius* have given this region up, almost; and the only birds that ever appear against the sky are the soaring golden eagles, and a very few hawks and ravens. Four of the latter fly daily over the cliffs, behind where we are at work, with such punctual regularity, that we can almost tell the time of day from their appearance. At 9 A. M. they come croaking along; their guttural exclamations of groag! groggle! grong! being very remote from Edgar Poe's sonorous "Nevermore."

A few days ago Mr. R. killed a fine buck, and cut off the head. One of the party, on going over to bring home this trophy, found it preoccupied by a golden eagle, who was making a dainty meal off the eyes and brain, whilst a flock of ravens and magpies, *Pica melanoleuca*, were perched at a respectable distance, watching with hungry eyes and twisting their necks awry as they saw one dainty morsel after another vanishing before the unlimited appetite of this aquiline majesty—not daring to approach, but waiting with the most comical gesture of impatience till he was through. Not many days ago, a small flock of the snow bird, *Junco hyemalis*, pitched near the railroad station; but I have not seen any since. Another, and rarer bird, but one familiar to any who may have visited the topmost peaks of the Rocky Mountains in Colorado during the winter months, is the gray-crowned finch, *Leucosticte tephrocotis*, a few pair of which pitched on the railroad track a week ago—their gray heads, with a dash of purple on the wing, easily distinguishing them from other snowbirds. These birds preluded a snow storm, which duly arrived next day. No doubt they were driven by it from the peaks into these lower regions, as I have often noticed them on such occasions in great flocks in the foothills and valleys of Colorado—altitude, 6,000 feet. But the miner, who is snowed-up half the winter on the top of Mount Lincoln, South Park, Col., at 14,000 feet, and the thermometer many degrees below zero, knows these little birds well, as his only and constant companions around the mouth of the mine. Both summer and winter they pick up a tolerable living from the stables and leavings around the miners' cabins, and during winter and summer rob him of strands of gunny-sack to build their nests. These, and the birds I have mentioned, seem the only feathered friends who are preparing with us to weather the severe storms of a Wyoming winter. A. LAKES.

ALBINOES.—*Portland, Or., Nov. 21st.*—During my recent visit to Spokane Falls, I stopped some days in Walla Walla, W. T., and, while there, I met Captain Charles Bendine, a most agreeable gentleman and naturalist. His collection of birds' eggs, numbering between thirteen and fifteen thousand, is one of the most complete in the world. The Captain had in possession, also, an "Albino" blackbird, perfectly white, which was a recent acquisition, he having secured it a day or two previous to my visit. This was the first "white blackbird" it had been my fortune to see, but I remember distinctly a number of years ago seeing a "white robin," but it was shot so badly it was impossible to preserve it. It was secured a short distance above town by a small boy, who, with an old musket, literally "filled it full" of No. 3 shot. I had frequently heard of white blackbirds, but never before of a white robin. MULTNOMAH.

ARRIVALS AT THE ZOOLOGICAL GARDEN, CINCINNATI, UP TO DECEMBER 1ST, 1879.—One ruffed grouse (*Bonasa umbellus*), six black snakes (*Bascanion constrictor*), three water snakes (*Trop sipedon*), two copperheads (*Ancistrodon contortrix*), one fox squirrel (*Sciurus ludovicianus*), one night heron (*Nycticorax gardeni*)

one red-tailed hawk (*Buteo borealis*)—all presented; three spotted hyenas (*Hyena crocuta*), two American elk (*Cervus canadensis*), all born in garden; one pig-tailed monkey (*Macacus nemestrinus*), five Macaque monkeys (*M. cynomolgus*); all purchased.

FRANK J. THOMPSON, Superintendent.

The Kennel.

EASTERN KENNEL CLUB FIELD TRIALS ON ROBBIN'S ISLAND, PECONIC BAY, N. Y.

December 9-13, 1879.

ABOUT fifty noted sportsmen from all sections east of the Mississippi River boarded the train at Hunter's Point, L. I., on the afternoon of Tuesday, the 9th inst, bound for New Suffolk, in the eastern end of the Island, to take part in the first annual field trials of the Eastern Kennel Club. Among the excursionists might be noted Paymaster Billings, United States Navy; C. D. Wagstaff, of Babylon, L. I.; Dr. Aken, of Brooklyn; Messrs. Tallman and Aldrich, of Rhode Island; Dr. William Jarvis, of New Hampshire; Thos. J. Gallagher, of the St. Louis *Globe-Democrat*; W. Young, Esq., of the *Sun*, and many others.

Arriving at Cutchogue depot, eighty-five miles from New York, the party, with their quadrupeds and hunting implements, were soon comfortably installed in the many family coaches sent from New Suffolk for their accommodation, and in a very short time were carried over the intervening two and a half miles, and landed at their respective stopping places.

Robbin's Island, the spot selected for the trials, is situated about the centre of Great Peconic Bay, and embraces about six hundred acres of land admirably adapted for hunting purposes. The land is rolling, part being woodland and thicket, the balance meadow land, with here and there bunches of low brush. About three hundred quail, principally from the Indian Territory, have during the past few weeks been turned loose on the Island by Ira B. Tuthill, jr., the present efficient superintendent. These quail are not more than half as large as our native species, but were for the most part received in good order, and the trials during the past few days evinced their spread throughout the whole island.

The following new rule was proposed, and after argument unanimously adopted:—

"The dogs shall be drawn in braces, by lot, and run in heats; the beaten dogs to be retired (except as hereinafter mentioned), the winner to be drawn and run again. The dog winning the final heat, in the first series of heats, shall be declared winner of the first prize. Then the judges shall select among the dogs which have run with the winner of the first prize, such dogs as they think possess sufficient merit to entitle them to a chance of winning second or third prize, and run them against each other; the winner among these shall then compete with the dog that ran the final heat with the winner of the first prize. The winner of this last heat shall be declared the winner of the second prize, and his last competitor winner of the third prize."

It was decided that the entries in the Puppy and All-Aged Stakes should close that evening; that the Puppy Stakes be run first, and that the Brace Stakes remain open until the finish of the All-Aged Stakes,

Puppy Stakes.—Open to all under eighteen months of age.—First prize: A cup and $25 added; second prize: $40; third prize, $20. Entrance: $12; forfeit, $8.

The following entries were announced: John B. Goodwin's (Norwich, Conn.), orange and white setter dog Grousdale, fourteen months old, by Grouse ex-Daisy Dale; J. O. Donner's (N. Y. City) white setter bitch Bessie, ten months, by Ranger II., ex-Belle; E. A. Spooner's (N. Y. City) black and white setter bitch Daisy, fourteen months, pedigree unknown, and Dr. J. F. Spier's (Brooklyn) white and black setter dog Banquo, eleven months old, by St. Elmo, ex-Flora.

The weather, Wednesday morning, though a little heavy, was considered favorable for the working of the dogs. At 8.30 all were aboard the fishing-smack *Emma Wilson*, Captain Acker, and within twenty minutes were safely landed on the island dock. The judges selected were C. D. Wagstaff, of Babylon, L. I.; Washington Coster, of Flatbush, L. I.; and T. F. Anderson, of Newton, N. J.

The first pair drawn to run together were Banquo and Grousdale. About 9:30 they were turned down in the open lot on the north eastern part of the island, but scoring a blank, they entered the thick cover south of this space. By this time in ranging, quartering and speed, Grousdale had already evidenced superiority over Banquo. Grousdale located a bird, Banquo failing to back, Banquo next points unsteadily, Grousdale however, firmly backing. The bird was ordered killed and the pair ordered up.

Bessie and Daisy were next turned down in an open field of about 100 acres. Daisy located and flushed a bird badly close to her. A bevy being started by the spectators and closely marked down, the dogs were ordered to that place. Bessie here pointed staunchly, and was well backed by Daisy, who however, at the report of the gun, the judges ordering the handler to kill, broke and chased the bird.

At 3 o'clock, Bessie and Grousdale were ordered down to decide first prize. Within a few minutes both dogs finely and staunchly pointed the same bird, and the almost holding of the breath of the spectators indicated their appreciation of this beautiful sight. Soon after this Bessie, by pointing and flushing an American sparrow, lost her chance of first prize, and Grousdale was the winner of the cup; Bessie being second.

Banquo and Daisy were then turned down to compete for third prize in the salt grass, where some birds had been placed. Both dogs scored a flush, and after considerable ranging it being impossible to decide which was the better dog, they were ordered up and the third prize equally divided between them.

At a meeting of the club, held at the Hotel, Wednesday evening, the following entries were paired to run in the order given below in the All Aged Stakes:—First prize, cup and $50 cash; Second, $50; Third, $25. Entrance, $15. Forfeit, $10.

First Pair—A Lansing's (Albany, N. Y.) white and orange setter dog, Max Harkaway, by Guy Mannering, ex-Quimby's Rose with E. A. Spooner's (N. Y. City) black and white setter bitch, Daisy, by Sensation, ex-Psyche.

Second—C. H. Raymond's (Morris Plains, N. J.) orange and white setter bitch, Floy, by Lincoln, ex-Fairy, with G. W. and A. Bassford's (White Plains, N. Y.) black and tan setter dog, Chris, by Rodman's Dash, ex- Nellie.

Third—Lincoln & Hillyer's (Warren, Mass.) red Irish setter dog, Arlington, by Pratt's Dan, ex-Hobart's Ruby, with W. Jarvis' (Claremont, N. H.) red Irish setter dog, Raleigh, by Elcho, ex-Rosa.

Fourth—J. Von Lengerke's (New Jersey) lemon and white setter dog, Jersey Dash, pedigree unknown, with W. Tallman's (Brownesville, R. I.) black and white setter bitch, Jennie, by Lathrop's Dick, ex-Harrington's Gyp.

Fifth—W. Jarvis' (Claremont, N. H.) red Irish setter bitch, Lora, by Elcho, ex-Rose, with Dr. J. Fleet Spiers' (Brooklyn) tri-colored bitch, Maida, by Spier's Dick, ex-Clio.

Sixth—Dr. Spier's (Brooklyn) Gordon setter dog, Romeo, by Gypsum, ex-Daisy, with C. H. Raymond's (Morris Plains, N. J.) lemon and white setter bitch, Lemonade, by Valentine's Glen, ex-Quimby's Nellie.

Seventh—Dr. Spier's (Brooklyn) black and white setter dog, St. Elmo, by Pride of the Border, ex-Jessie with Thomas A. Howell's (Brooklyn) white and orange pointer dog, Shot, by Sensation, ex-Psyche.

Eighth—Fred Heiseman's (Greenpoint, L. I.) liver and white pointer dog, Ned, by Maillard's Dick, ex-Hudson's Fan, with Dr. Spier's white setter dog, Sid, pedigree unknown.

Ninth—W. S. Blydenburgh's (Brooklyn) red and white setter bitch, Bessie, by Howe's Dash, ex-Dailey's Fan, with L. H. Morris' (Lore City, O.) red setter dog, King, by Plunkett, ex-Kitty.

The weather Thursday morning was lowering, with a perceptibly heavy fog during the earlier hours, and frequent showers the remainder of the day. Promptly at 8 o'clock all embarked, and by 9 o'clock were in working trim upon the island. Daisy, Shot, and King, failed to put in an appearance, and forfeiting their entrance money, the heats were respectively given to Max Harkaway, Floy, Raleigh, Jennie, Maida, Lemonade, St. Elmo, Ned, and Bessie. The heat of Jennie and Jersey Dash was very close, both dogs exhibiting great speed, staunchness, and the best of control, under their handler, Tallman. In the fifth heat Lorna unwittingly flushed a bird, and was thus ruled out. In the next heat, Romeo, after doing some excellent work, and backing Lemonade at fully two hundred feet distance, lost the heat by breaking and rushing in on his mate.

About 2 o'clock the winners in the above heats were again paired for second trials. Bessie and Maida were ordered down first; the poorer dog, Bessie, winning by bad conduct on the part of Maida. Max Harkaway and Raleigh were the second pair. This heat was especially interesting, as the whole work was carried on in plain sight of the spectators, and the dogs worked admirably in every way. A flushed bird circling round the crowd broke up Max and gave the heat to Raleigh. The day's sport closed with a heat between Ned and Floy, Ned winning an easy victory, though not so good at quartering as Floy.

At the Thursday evening meeting of the club it was unanimously decided to hold the next annual field trials at the same place, Robbin's Island, commencing on Tuesday of the week preceding Thanksgiving, 1880.

The weather Friday morning was lowering, but by 9 o'clock the clouds parted, the sun shone forth, and a brilliant day for sport was the result. The running of the second ties commenced promptly at 9 A. M., Jenny, the bye dog, first running with St. Elmo, and winning the heat after forty-five minutes time by superior work. Jennie and Lemonade then ordered down. So soon as they entered the scrub oak Lemonade made a false point. Catching scent not long after he acted abominably by flushing the bird and running after it. At 11.45 Jennie was declared winner of the heat.

At 12 M., sharp, Jennie was again ordered down to run with Raleigh. The latter soon made a false point, Jennie refusing to back. Raleigh then flushed a bird. Soon Jennie pointed, Raleigh backing her nicely. Ordered to flush, Raleigh jumped twice towards the bird, but at command of handler, stopped. The heat was then given to Jennie.

The next pair, Bess and Ned, were ordered down about 1 P.M. Ned being unused to field work of this kind acted badly, but proved his superiority in speed and delicacy of handling birds. After thirty minutes, the heat was given to Bess.

Bess declining to run against Jennie forfeited first prize to the latter.

The following were thus left as competitors for second prize, viz.:—St. Elmo, Lemonade, Raleigh, Bess, and Jersey Dash. Lemonade and Bess withdrawing, St. Elmo and Dash were paired to run first heat. St. Elmo soon made a false point, and not long after flushed a bird. He soon again took scent, pointed staunchly, while Dash ran past the bird, thereby losing the heat.

St. Elmo and Raleigh were then ordered down for the final heat. After some excellent work, each backing the other most handsomely, the second prize was awarded to Raleigh through St. Elmo flushing and jumping after a bird. The latter was given third prize.

Entries for the Brace Stakes were next called for. First Prize, $100; Second, $50. Entrance, $15. Forfeit, $10. Five entries; the number required to fill were soon announced. They were (1) Goodwin's Grousdale and Aldrich's (Providence, R. I.), black setter bitch Smut—handler, Tallman. (2) Dr. Blydenburgh's Gordon setter Glen, and white and lemon English setter, Ned—handler, Blydenburgh. (3) Sid and Maida—handler, ————. (4) St. Elmo and Romeo—handler, Height. (5) Raleigh and Lorna—handler, Wanamaker.

The first brace were ordered down at exactly 4 P. M. Tallman, the handler, labored under the disadvantage of being wholly unacquainted with Smut, the brace having been made up but a few moments before the entries were made. The first point made by Smut was false. After considerable ranging, Smut, well-backed by Grousdale, again located some birds, which, being flushed to order, the bitch retrieved in good style.

The next brace were at 4.45 ordered down over the same course as the preceding brace. Although Glen is much the speediest dog, Ned located the birds first, well backed by Glen, at nearly a hundred yards distance. Ordered to fire. Glen made the best retrieve, as he had already made the best back of the whole trials.

About sunset, St. Elmo and Romeo were ordered down over the same course. Romeo, well backed by St. Elmo, located first and retrieved well. At half-past five, it being too dark to work longer, they were ordered up.

Saturday opened with a fine clear sky, sharp, bracing air, which upon the exposed parts of the island proved very searching and uncomfortably cold. Promptly at 9 o'clock Sid and Maida were ordered down. Sid caught scent first, and was well backed by Maida, Sid retrieving after bird was killed in excellent style.

At 9.30 Lorna and Raleigh were called. Raleigh scented first, as he was going at almost whirlwind speed, stopped instantly, and bent around, the form by his fore and hind parts seeming to be almost at right angle. Lorna backed him well.

At 10 o'clock Glen and Ned were again called. After much ranging and quartering, scent was taken in a hollow, out of sight of the spectators. The dogs stood firm for over five minutes, until the spectators could get within sight. Ordered to retrieve the killed bird. Ned again took scent, and pointed finely until Glen had brought the bird out of the brush, and delivered it to the handler.

The judges of the day, after consultation announced that the first prize was awarded to Glen and Ned, and the second prize to Grousedale and Smut, a decision which appeared to be a genuine surprise to many. Dr. Wm. Jarvis, on behalf of Raleigh and Lorna entered a written protest against the payment of the prizes, until the matter had been presented to the Appeal Board of the National Kennel Club, and their decision had been announced.

Thus at 10:30 A.M., on Saturday, the 13th inst., closed the First Annual Meeting for field trials, certainly one of the most successful ever held by any club. The absence of many noted hunters from well-known kennels might be commented on, as also the absence of all pointers but two. The excursionists as a body were well pleased with the accommodations afforded them, the uniform kindness on the part of the residents in the vicinity, the unequalled advantages of New Suffolk for fishing and boating in the summer, and for duck hunting in the fall and winter, as well as the beautiful scenery and excellent condition of the island for the purpose desired by the club.

DOG "SALMONING."

THE strange caption under which we are writing will strike all our Eastern readers very curiously. It is not only one which is wholly new to them, but which at once opens up an entirely new field of investigation. A dog is said to be "Salmoning" when he goes out along the salmon rivers of the Pacific, preying upon the fish which have died in their struggles to ascend the stream to their spawning beds, and been cast up on shore; "Salmoning" is also the technical term for that fatality which most always results from eating such fish.

Fish culturists have now learned that salmon and other fish which have suffered injuries and abrasions of the skin from fighting with each other, struggling among rocks, being temporarily held in nets, or wounded by spears, etc., invariably become diseased with a fungus which attaches itself to the wounded parts, and ultimately die. In reply to our correspondent's solicitous inquiries, in behalf of himself and of a large hunting club which he represents, we may suggest that the diseased fish poisons the dog by transplanting the fungus to his viscera and vital organs. We merely suggest this, and leave the subject to pathologists and doctors to determine. We may, say, however, that the dogs of Labrador, which are used by the coast dwellers for draught purposes, subsist almost exclusively upon fish; but these fish are fresh and not diseased, and many of them are captured by the dogs themselves, which watch for them by the sea-side, as keenly as do the seals and otters. Hence fresh fish evidently is not detrimental to dogs, and we can only conclude that diseased fish would affect them as injuriously if they ate them, as they do their canine cousins of the Pacific coast.

The singular part of our correspondent's statement is that some dogs have become accustomed to salmoning, and survive. This on the principal, we suppose, that old topers seem to thrive on whiskey which has failed to kill them.

CORVALLIS, BENTON CO., OREGON,
November 23d, 1879.

Editor Forest and Stream:—

Several rivers in Benton County empty into the Pacific Ocean, and up these rivers large quantities of several varieties of salmon come in their season to spawn.

Many of these fish, after spawning, become so weak that they are unable to return, and in a sort of dying frenzy, or struggle, reach the shallow water near the shore, where they perish, whence they are eagerly sought for and devoured by bears, panthers, catamounts, grey wolves, coyotes, and our house and hunting dogs. The bears and the felines eat them with impunity. Not so with the wolves, coyotes, and dogs. These latter die annually in great numbers from "Salmoning" as it is called here. So far as the wolves and their first cousins, the coyotes, are concerned, we have no complaint to make. We consider rather that the result spoken of is a wise provision of nature, which keeps back the production of these "varmint."

But we object to the loss of our dogs, and wish your advice and suggestions in the premises.

The symptoms of dog "Salmoning" are thus described: "Eight or nine days after a dog gets his first dish of

salmon his hair begins to look rough and uneven, and matter accumulates in the corners of his eyes. He refuses food, and drinks very frequently of water. If he attempts to eat he acts as if his teeth and gums were sore. When the disease is at it worst the dog generally slinks away and hides until death; occasionally, however, one returns and seeks his master, to die at his feet, acting at the same time as if some miserable enemy were pursuing him. Young dogs (under a year) almost always die; older dogs recover, sometimes, but bear marks of the attack in an impaired scent, and sometimes in "twitchings" such as a dog has after a severe attack of the distemper.

Post mortems made on dogs dying from this disease, reveal an apparently diseased liver, covered with a whitish coat or mucus, while the gall seems greatly enlarged, and the bowels torpid and congested.

The only theory we have heard advanced here, is that a dead salmon is largely charged with phosphorous. It is said that a decaying salmon shines in the dark like "a chunk of fox fire," as the boys say.

Let us have your opinion on this subject; and if you think that the symptoms indicate phosphoric poisoning please suggest a remedy. The only one we know of is to keep our dogs tied up from September to January. It may be mentioned that the same results follow when our dogs eat such portions of brook trout as are left lying around camp. And further it may be remarked, that after a dog recovers from an attack of "Salmoning" he can eat salmon for the rest of his life with impunity. But the many die; the few escape. Awaiting a reply in your ever welcome journal, I am, &c., W. B.

CAPT. McMURDO'S SPANIELS.

MANY inquiries having arisen of late as to this peculiar strain of dogs, and their qualifications, we are glad to present the desired information from the Captain's own pen. *En passant*, the offer which our correspondent makes to sportsmen at the end of his communication is worthy their attention:—

EVINGTON, CAMPBELL CO., VA., December 5th, 1879.

Editor Forest and Stream:—

I was much pleased to hear from you, and shall be glad to give any information I can about my spaniels that is likely to be useful to sportsmen; though, having left New Brunswick for this much superior hunting country, I am turning my attention to setters and pointers, and do not intend breeding spaniels to any extent in future. I hope, however, to be able to keep up a small team of them for ruffed grouse, cock, hare and duck shooting.

I think any one who has ever shot over any of the spaniels I have trained, will admit that in a country where wide ranging dogs are necessary, such spaniels are far preferable to pointers or setters.

The history of my strain is a very short one: less than four years ago I imported a Sussex dog and a small sized English water-spaniel bitch, both very handsome, and from prize stock. All their progeny that I have trained have turned out excellent, and are remarkable for their beauty, intelligence, nose and retrieving qualities.

The peculiarity of my training, I suppose, consists in my teaching them to put up their game cautiously (the reverse of cocker fashion) and having them so well in hand that they will "down charge" at a word or sign when on the point of flushing game, thus enabling the person shooting, to take up a good position to fire from. Of course they drop to shot and wing.

Here, in Virginia, I invariably take one out when quail shooting, for retrieving and working out branches and other rough places, for I have not yet seen the pointer or setter that does that sort of work equally well.

Their size is usually from twenty-five pounds to thirty-five pounds, and their color a very dark liver or liver and white; coat more or less curly, with plenty of feather, and ears long and silky. In form they resemble the cocker, but are stronger without being nearly so heavy as the clumber. The time and attention that is necessary to make these dogs perfect is so much greater than that required for the training of pointers or setters, that I do not think it would be a remunerative business breaking them for sale, as the public would probably imagine that as they are only half the size they ought only to cost half the amount.

Should any of the readers of FOREST AND STREAM wish for further information on any particular point, I shall be happy to give it.

How are you off for good trainers? If any of your friends have more first-class pups than they can dispose of, I should be happy to train one and return it out of every two sent me; of course I could only manage a few at a time.

I am delighted at the prospect of field trials being held in the Eastern States, and hope soon to have some dogs worth entering. C. E. McMURDO.

REMARKABLE INTELLIGENCE IN A DOG—*Rockland, Me., Dec. 5th.*—I have an English setter named Don, two years' old, that I keep chained when not using him. On going home to dinner one day last week I found Don in the house, and my wife said that he had broken his collar or had slipped it off over his head. I went out to his kennel, there lay the collar unbuckled. I went into the house and asked my wife if she had seen any one about the yard, as I thought that some one must have unbuckled the collar; she replied that no one had been seen there, and did not think the dog would let any one come into the yard, as he is a first class watch dog and don't take to strangers. A few days latter our nearest neighbor came in and asked my wife if she knew that Don was loose, and if she knew how he got loose; she said that she was looking out of the window and saw a little coach bitch that belongs to a neighbor trying to get the collar off of Don's neck, which she succeeded in doing, and then the two dogs went to playing, and seemed highly pleased with their trick. My wife called Don, put his collar on and fastened him again, and took a position at the window where she could command a view of the yard. In a short time she saw the little coach bitch coming, and saw her go up to Don and commence work on his collar. Don held his head as still as if on a point, and the little bitch worked away on the collar, till she got it almost unfastened, when my wife thought it time for her to interfere, so she drove the little bitch off, buckled Don's collar and then tied it with a string. The little bitch continues her visits, but I have fastened Don's collar so that she cannot get it off for him.

I have read of a good many dog tricks, but I think this the best one out, don't you? The above is *strictly* true, and is no Pike story. REMINGTON.

A PRIMA DONNA'S DOG.—When the troupe arrived at the Monongahela House yesterday, Patti and her maid and the dog were among the first to alight from the carriage and enter the hostelrie of our city. Up the stairs, and into the rooms engaged for the great singer of America went Patti and her maid and the dog.

The faithful servitor, who shows the guests to their rooms, reported the dog at the hotel office.

"No dogs on our velvet carpets," said the clerk. "Tell Miss Patti we have places for dogs, and get the animal and take it to the kennel."

The faithful son of Africa departed on his errand, but returned empty handed.

"Boss, dat sing woman says that de dog must stay in her room," was the answer.

"It must, must it?" and up the stairs ran one of the head centres from the office. Arriving at the door of Miss Patti's room, Mr. Grau was encountered. He had been trying to reconcile the dog business.

"I will not send Bruno to a kennel. He has never been treated so in any hotel in the country."

"But mademoiselle, it is positively against the rules to allow any dogs in our best rooms."

At this point the French maid remarked: "Ze poor leetle Bruno," and she took him in her arms, his eyes scowling on the clerk, and his tail in gentle repose, while his pug nose pointed in a dog-goned way at the clerk. "I will take ze Bruno to my room, and zer I will keep him in so snug as ze bug in ze leetle rug."

This brought forth a scene. Patti burst into tears, and retired to a convenient rocking chair. The maid followed her, and sinking upon her knees beside the great cantatrice, wept enough aqua pura to start a small rise in the river. Mr. Grau looked into the room, and turning pathetically to the clerk, said:

"Mein Gott! mein Gott!! dese are an awful dings. If Patti does not have her dog she will not be able to sing a note to-night. Zis is one damnation of ze dog," said Mr. Grau.

A compromise was effected by allowing the maid to take the dog to her room, and this incident may account in some manner, for some of the singing done at Library Hall last night.—*Pittsburg Leader.*

—Forest and Stream Kennel, Detroit, Mich., L. T. Whitman proprietor, has made the following sales of the Rattler (Rob Roy-Pickles), Pat litter: S. D. Miller, Detroit, 1 lemon belton dog; Jno. Jackson, Detroit, 1 lemon belton bitch; also to J. H. Hitchcock, Weaver, Minn., 1 white, black, and ticked bitch.

—Dr. I. Reily Bucher's (Lebanon, Pa.) orange and white setter bitch Belle (Sport-Flora) whelped November 16th seven puppies (three dogs and four bitches), and sired by Samuel J. Down's Shot (Joe-Belle) of Philadelphia, Pa.

VISITS.—On December 6th Mr. J. B. Harrington, of Buffalo, N. Y., bred his liver and white-ticked cocker spaniel bitch Floss—imported Fan-Rake—to Mr. C. Battey's liver and white cocker dog Con—McKoon's Sam Daisy.

Ethan Allen's setter bitch Cosey, by dog Fay, Pomfret, Conn.

NAMES CLAIMED.—Mr. Henry W. Livingston has purchased from Mr. Justus Von Lengerke the red Irish setter bitch Nellie, by Mr. Kenneth, G. White's (formerly Foulk's) Tom, out of White's Lady. Mr. Livingston claims the following names for his lemon and white pointer pups, by Orgill's Rush out of Livingston Rose; dogs: Baronet, Viceroy, Consul, Envoy, and Dictator; bitches: Gilt and Gossip.

PUBLISHER'S DEPARTMENT.

—Messrs. Lord & Taylor's methods of filling orders from abroad are so perfect that their mail customers express the greatest satisfaction in their dealings with them. Our friends, who may not be able to visit the city in person, can send to Messrs. Lord & Taylor for prices or advice, and will always receive prompt attention. For Southern outfits the house is unsurpassed. In the two establishments of the firm, can be found every article necessary for the dress of the family.

VERBUM SAP.—That used to mean "a word is enough." Now the new lexicographers tell us it means "a word about Sap," *i. e.*, Sapanule. Robert Bonner uses Sapanule and says he "finds it an excellent lotion for allaying inflammation." That is both "a word about Sapanule," and "a word which is enough."

AMERICAN ART.—The advance of America in skilled handiwork has never been more emphatically demonstrated than by the world-wide reputation of the artistic work of Messrs. Tiffany & Co., Union Square. The award of the *Grand Prix*, at the Paris *Exposition Universelle*, in 1878, and the notice thereby attracted to their work, has compelled the house to provide foreign branch establishments for the sale of their goods. The little hand-book of the many hundreds of elegant holiday presents to be purchased at the Messrs. Tiffany's establishment, shows such a store of treasures as the magicians in the Arabian Nights never dreamed of.

AN OLD MAN REJUVENATED.—Peter Showerman, of Batavia, N. Y., certified Sept. 15, 1879, as follows: "For forty years I have suffered with kidney and liver difficulty and have also been a great sufferer from palpitation of the heart. I am now using your Safe Kidney and Liver Cure, and can truly say, at 70 years of age, that it makes me feel like a new man."—[*Adv.*

Answers to Correspondents.

No Notice Taken of Anonymous Communications.

E. S. H., Grand Rapids.—For British Water Fishes address office of London *Field*, 347 Strand.

J. B. H., Carlisle.—Your dog's trouble is probably owing to defective teeth. The tartar must be removed, or the worst teeth extracted. Show him to a dentist.

G. G. F., Brooklyn.—Can you inform me from whom I can purchase one or two fox-hounds? Ans. From L. M. Wooden, 119 Bower's Block, Rochester, N. Y.

GROUSE, Pottsville.—Do you know of any one having a Spanish pointer stock for sale, or of any one breeding the same? Ans. No; the stock has pretty well run out.

FISH POND.—Will the gentleman of Nashville who has a fish pond that he wishes stocked, send his name to J. B. & F. W. Eddy, Randolph, Cattaraugus County, N. Y.

H. L. C., Westboro, Mass.—Am a lover of dogs; own three terriers. What good work can I get on dogs? Ans. "Dogs of Great Britain and America." We can send it. Price $2.

FISH HOOK, Syracuse, N. Y.—Yes, the stories in the Big Fish Hook competition are every one of them strictly true. If their authors hesitate to attest their own veracity, we do not.

J. H. P., Scranton, Penn.—Can you let me know through your correspondents' column where I can obtain a smooth-haired Dachshund in New York or Pennsylvania, and oblige. Ans. Write to Dr. L. H. Twadell, West Philadelphia.

E. F. H., Greenville, O.—For works on trapping, buy Batty's "Taxidermy" and Batty's "How to Hunt and Trap," Orange Judd, New York; Gibson's "Complete American Trapper," ditto; and Newhouse's "Trappers' Guide," Oneida Community, New York.

W. W. MCCAIN, Rush, Pa.—Your dog has canker of the ear. A cap should be fitted to his head to prevent shaking of the external flaps. The internal ear should be kept clean by syringing it with warm water, and a weak solution of lead water poured in the ear twice a day.

J. D. J., Mystic Island, Conn.—How can I remedy the terrible scratching my gun has received through shooting from a stone stand at ducks? It seems impossible to avoid it, even with great care. I mean do you know of any oil that will cover? Ans. Your only recourse is to rub out the scars; and that may injure the gun.

L.B.L., South Framingham.—Will you be kind enough to inform me if there is any book published giving special directions for breaking or training setters, and if so, where such book can be bought, and at what price? Ans. Mr. Laverack's book is the only one treating of setters alone. We can send it. Price $3.

J. W. L., Boston, Mass.—The fare from New York to Jacksonville, Fla., is $23. The cost of living in Florida per week ranges from twenty-five cents to twenty-five dollars. It depends upon where and how you live. You ought by all means to have enough money to support yourself the first few weeks, and enough to pay your expenses back to Massachusetts if you are disappointed.

V. V., Mayworth, Canada.—To your seven questions about Florida we answer: If your lungs need the Florida climate, go there and take your family. If you can live anywhere else, don't go to Florida. You can obtain all the information available about the State by writing to the Bureau of Immigration, Tallahasse, Fla., and a great deal more by personal investigation on the spot. But our advice about settling there is that of *Punch* to people contemplating marriage—"Don't."

W. A., New York.—Please inform me whether there is any game to be found at New Paltz, near Lake Mohawk, this time of the year. I have lately purchased a breech-loader of E. Harris, New York. The bore is No. 12, length of barrel thirty inches, weight seven and a half pounds. Is such a gun adapted for partridge, quail, rabbit, and squirrel shooting? And also at what distance should such a gun kill, with No. 8 shot, three and a half drachms of powder? Ans. 1. A few grouse, rabbits, and squirrels. 2. Will shoot anything at forty yards if you only hold on to the mark.

S., Fort Johnston, N. C.—How does the British Museum compare in size with the National Library of France at Paris, *i. e.*, how many volumns, MSS., etc., in each? Ans. The British Museum Library is not by any means as large as the great French Library, until the fall of the Empire called the Imperial Library, which is the finest in the world. In 1857 the printed books in the British Museum numbered about 565,000 volumes and the MSS. 40,000, while in the Imperial Library there were 815,000 printed books and 84,000 MSS. Probably the relative numbers are not very materially altered at the present times.

N. E. J., Brooklyn.—1. What part of a breech-loading shot gun is the "firing bolt?" 2. What is the proper load in a 12-gauge gun for quail, partridge and woodcock? 3. Are all the Parker guns full choked? 4. Is 185, for both barrels of a 12-bore gun, considered a good pattern, where three and a half drachms of powder and one and a quarter ounces of shot were used; shot, No. 8; distance, forty-five yards; 24-inch circle? 5. Are ducks and geese found on the Connecticut River, and if so, at what time of the year? Ans. 1. You probably mean the firing pin, which is the small pin struck by the hammers, and which explodes the shell. 2. If of average weight, three and a half drachms powder and one and an eighth ounces shot. 3. Not unless so ordered. 4. Yes. 5. Ducks are found there during October and November.

A. C., Moira, New York.—Books on taxidermy are Coues' "Manual of Ornithology," a manual of taxidermy and field work, price $2.50, published by Govt. Printing Office; C. J. Maynard's "Naturalist's Guide," price $2, Naturalist's Agency, Salem, Mass.; Brown's "Taxidermist's Manual," price $1, Orange Judd & Co., New York; "Taxidermist's Manual, published by Jesse Hanley & Co., 119 Nassau street, New York. J. B. Davies's "Naturalist's Guide," and R. Avis' "Bird Preserving," are English books and can be obtained of Sabin & Sons, Nassau street, New York. In addition to these works especially devoted to the subject, Hallock's "Sportsman's Gazetteer" has several pages of practical instruction. "Wrinkles and Receipts," published by Munn & Co., New York, also treats of the subject. Batty will soon publish a book on the subject.

ANIMALS RECEIVED AT CENTRAL PARK MENAGERIE FOR WEEK ENDING DEC. 13TH, 1879:—Two Messina partridge (*Caetonyx messina*), hab. Texas, presented by Miss Banks, Englewood, N. J.; one grey fox (*Vulpes virginianus*), presented by Mr. Lawson Valentine, Orange, N. J.; one angora goat (*Capra hircus*), presented by Mr. Richard Peters, Atlanta, Ga.—this buck is from the original importation of Dr. Davis in 1848; one canary bird (*Serinus canarea*), presented by Mr. Frederick A. Clarkson, New York City; one snowy owl (*Nyctea nivea*), presented by Col. Rowland, London, England this bird flew on board of steamship *Egypt* when 250 miles off coast of Newfoundland on her last trip to this city; one double-crested cormorant (*Graculus dilophus*), presented by Messrs. Chas. Reiche & Bro., New York City; one wood ibis (*Tantalus loculator*), purchased. W. A. CONKLIN, Director.

FOREST AND STREAM ROD AND GUN

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

FOREST AND STREAM PUBLISHING COMPANY.

—AT—

No. 111 FULTON STREET, NEW YORK.

[POST OFFICE BOX 2832.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Advertising Rates.

Inside pages, nonpariel type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial column, 50 cents per line—eight words to the line, and twelve lines to one inch.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

***Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, DECEMBER 18, 1879.

To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith and be addressed to FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. Anonymous communications will not be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of mail service if money remitted to us is lost.

☞ Trade supplied by American News Company.

IZAAK WALTON ON THE NEWS STANDS.—The English *Fishing Gazette* has for a portion of its title-piece a handsome vignette of the patron saint of the craft, Izaak Walton. The good old soul could hardly have dreamed of thus achieving the news-stand fame of these latter days, for that peculiar institution itself sprung into sudden existence long after his day. Nor could the most sanguine angler of those days have anticipated a time when a *Fishing Gazette* should be published weekly—its sixteen pages devoted solely to the rod and line. Could the old gentleman walk among us for a day or two, his astonishment at all the new-fangled piscatorial contrivances of the London of the present, would culminate when he beheld his own genial self in antique dress thus displayed on the street corner, in railroad depot, and hotel corridor. There he is, encircled by the legend, "Born, 1593—Izaak Walton; died, 1683," which he that runs may read. And the most careless passer by, it seems to us, should stop to look for a moment at the kindly face there, with the long locks of the day, the broad collar, and the coat with the lace and the great buttons. Walton is preaching to-day, as he preached two hundred years ago, a gospel of the woods and streams, and the things of nature as God made them for man. The editor of the *Fishing Gazette* has put on either side of the central vignette a scene from this out-of-doors world—on the right, the sea with the rising sun, and on the left a stream with village and stretch of woodland; and the busy worker in the very heart of London town, may here catch a glimpse of the old familiar days of his childhood, and snuff again the salt breeze of his seaside home. It would be a vain subject of conjecture, but we are confident that this portrait of the father of angling, and these enticing sketches, must have lured many a man out from the city walls for a tramp beside the river with rod and creel and lightsome heart.

A SUGGESTION TO POSTMASTER KEY.—The Post-Office Department now requires all letter writers to include the county, as well as the town, in the addresses of their missives. Now, if the Department itself would only require all postmasters to incorporate the counties in their official post-mark stamps, it would be of material assistance in imparting to the public a knowledge of geography of which they seem to be generally deficient. Possibly, however, the sale of the "Postal Guide" is of paramount consideration.

ENGLAND AND TURKEY.—About 10,000 turkeys have been shipped from Canada to England. Christmas!

THE FORESTER SCHOOL OF BATHOS.

WE have already spoken of the fashion set by Forester, and followed by his disciples, of making the potations of the sportsman a prominent feature of field stories; and we have sometimes thought that the author has had a very appreciable influence upon the literary style of amateur writers upon sporting topics. There is a class of young rhapsodists who profess to find in Forester beauty of sentiment and style exhibited by no other English author; and who, consequently, model their own effusions after his style. Now, without detracting in the least from Forester's deserved great fame, we may suggest that in common with many writers of his time, he is somewhat out of fashion so far as mode of expression is concerned. The adjective does not play so important a part now as it did then. We have now-a-days less of vague, expansive soaring, and more of common sense, straightforward, plain English prose. One reason of this is, that one hundred authors are now writing where ten were writing then. To find an audience the one hundred must be much more terse and explicit than it was necessary for the ten to be. Washington Irving's Sketch Book is not read as much as formerly; not alone because it is crowded out by the thousand and one new books of like character, but because its style is too rambling and diffuse for the day. The intensity and compactness which mark the American's character in other fields, has its influence also in literature. In this literary world it is true this new order of things may be a mistake, but at all events the tendency becomes well defined to any one who will take the pains to compare the old and the new books in his library.

We have, in the writings of some of the self-constituted sporting literature oracles of the day, a survival of the crudities and faults of the American literature of the past. This is not difficult to explain. It is always easier to imitate faults than excellencies; to catch the hollow form of a writer's style without at all entering into the spirit of his writings. And, again, the influence of a writer who is the only author, or one of a very few authors, read by the amateur wielder of the pen, is so unmistakable that he falls unconsciously into the same set phrases and turns of expression. When a young man says of Frank Forester's writings, that "All bear the indelible impress of a master mind, and have the qualities of imperishable works," and that "the bright thoughts of his surpassing genius, as embalmed in his writings, will ever remain a grand and indestructible monument to his memory, more durable than bronze or granite memorial, as these shall remain fresh and beautiful when the more perishable material would have crumbled or been consumed by rust;" and, still farther, that "the spirit of Herbert is still with us," and that "we feel its presence; we are cheered by the inspired teachings, and under the consolation thus afforded, are better able to bear the loss of his material form and awe-inspiring presence;" and when we read such stuff as this, written by a person of the masculine gender, and published in the Year of Our Grace, One thousand, eight hundred and seventy-nine, we may safely conclude that something more than the literary taste of the writer is affected by the devotion to "the lamented master of the craft;" a devotion so intense, indeed, that we are threatened with its outgrowth at a future date, in the shape of a "work," illustrative of the literary achievements of the spirit aforesaid.

It is a relief to turn from this balloon style of adjective flying to the numberless common sense and valuable papers which are written by sportsmen, for sportsmen, and published in the sportsmen's journals of the day. The Forester school is only a little orbit within itself, growing gradually smaller from year to year. The majority of those who employ their pens in writing to FOREST AND STREAM, even though they are non-professional writers, put their ideas into plain, intelligible prose. Were this not the case we should long since have been forced to suspend publication; for, however much the Forester school may enjoy composing their effusions, it is certain that people will not pay four dollars per year for the privilege of reading them.

While the writings of Forester hold a deservedly high place in the library of the sportsman, and are likely to maintain that place for a long time to come, we are gratified to see the influence of their style gradually decreasing among writers.

Some have been found to argue that composition is a direct means of culture; that if a person has appeared in print—even though it be only sandwiched in among the advertising columns of a tailor's monthly—it is a step in intellectual growth. The mere publication of the article does not, in itself, argue such an advance, but its subject matter may. Possibly, too, even in the latter case, it would have been better worth the literary aspirant's time and trouble to have absorbed the writings of some standard thinker, than to have palmed his own crudities off upon the world.

The best writing is that of him who has something to say. The plain statement of an observation in natural history, projectiles, or mechanics, a practical description of a shooting or fishing trip, and kindred communications, are more useful to the sportsman than all the inflations of the aping imitators of blank verse. Posing on the pinnacle of a church steeple may make the populace open wide its mouth in wonder, but it is, on the whole, neither a useful nor a lucrative performance.

A GLANCE AT THE PAST CRICKET SEASON.

As leaves on trees the life of man is found,
Now green in youth, now withering on the ground;
Another race the following spring supplies—
They fall successive, and successive rise.
So generations in their course decay,
So flourish these when those have passed away. * * *

CONSIDERING the immense extent of the American continent, and the great increase of the game, which, in many places, is but yet imperfectly understood and reported, it is almost impossible to give a correct resumé of the season of 1879.

Geographically, cricket is played from Nova Scotia in the East, to San Francisco in the West; while it is not unknown in Manitoba in the North, or Louisiana in the South. Even the disciples of Joseph Smith have been found, during the past season, trundling the ball at Salt Lake City, and the moonshiners of North Carolina, deserting their mountain stills to follow the same recreation. Notwithstanding that the game has sprung into life in many queer, out-of-the-way places, its marked increase in popularity has been more fully illustrated in the Middle States—27,000 persons alone witnessing one match in Philadelphia; and in the Dominion of Canada we also find the game has been extensively patronized. It will be perfectly safe to say, that over a hundred regularly organized clubs have been formed, many of whom have engaged in both local and foreign matches. Although it is true that the visits of both the Irish and English teams, and the Canadian matches, have given the game an impetus, yet early in the year, before their coming, it could be seen that the game had never before found such a strong foot-hold. It began to crop up in our finest colleges and schools, and it is to these institutions that the game must look for its strongest support and best exponents.

Glancing backwards twenty years, we see the schoolboy with his home made bat, weighing at least three pounds, content to play his Saturday game on some well-worn and hardened spot on any rough unfenced common; and only too happy if left unmolested. When some out-of-town eleven put in an appearance, he would beg a day off from school, and from the sharp edge of a post and rail fence, watch the game in silent earnest. With solemn awe, would he look up in the face of "the professional," and take in his make up from cap to spikes, and on the Saturday following he would limp home with larger lumps than ever on his legs. Is that the case of to-day? Not by a great deal. The scholar, now, when not occupied by "taking a few" from his club's professional, can be seen sitting on the club house porch, with one of "Cobbet's best" between his well padded knees, criticising the play of his elders with a deal more truth than poetry. Mr. Daft is no terror to him; he even doubts if Shaw can readily get his wicket. This boy has learnt the game and has had his practice on a first class wicket where he knows no fear, and besides this has had good tuition from those who know the game, and he has acquired confidence. It is this class which is now filling many of our best elevens, and doing good service for their clubs. Nor should we, in our retrospect, forget the great improvement made in our cricket grounds, for it is mainly due to their excellence that the tyro gets his fondness for the game, and the plucky one becomes a player. We cannot urge too strongly the absolute necessity of having good grounds upon which to play. They cannot be too level or well cared for.

Besides the new clubs we have mentioned, there is every reason to believe that a large majority of the old organizations have had many new recruits, and retained their old members. There is no reason why every club in the country should not be in a flourishing and prosperous condition; and when it is seen that any are running down and losing caste, the cause can generally be traced to a lukewarm and inefficient management. Too many clubs are saddled by some autocrat—some "old man of the sea," and the sooner these organizations free themselves of their burden, the better it will be for the game of cricket.

The season opened early in May with a match played at Hoboken, between an eleven including seven of Lord Harris' Australian team, and an amalgamated team made up of New York and Philadelphia players. The next important feature was the United States-Canada match, played in August at Ottawa, and then followed the successful tour of the Hamilton Club, while later on came the amateur Irish and professional English elevens. Sandwiched between these great events were innumerable local matches and several minor tours, of which those of the Peninsular and Staten Island Clubs come foremost. Never before in the history of American cricket were there so many matches played, or so many scores of games recorded. Heretofore cricket has been confined to certain localities, but last season the game

appears to have suddenly found favor with the public in many new places. The cricket columns in the late numbers of the FOREST AND STREAM will show how the game is now distributed over the country. We have published over one hundred and fifty full scores of matches, besides referring to as many others. Our principal aim has been to give in our record each score correctly, and for this reason we often delayed the publication of a match until we could vouch for its correctness. We have noticed all the important games in full, many of which we reported in person, and our aim has been to be impartial and just. It is now proposed by the editorial management of this journal to continue the cricket column through the winter months, publishing the averages of the principal clubs, and later on, a series of articles which will be interesting to all lovers of the game. We fortunately have in our possession many old records of the game, and will be pleased to furnish what information we can to those who care to revive their cricketing days of the past. We earnestly request the coöperation of all Club secretaries, and will at all times be pleased to serve as a medium through which cricketers can hold communion with each other, and express their views.

SPORTSMAN AND GENTLEMAN.

THE artist poses his subject before a landscape scene with stretch of country, woodland and winding river. This background adds to the beauty of the portrait, and the picture is in an artistic sense more pleasing than one which could be made with the studio walls for a setting. The devotee of rod and gun who is pictured from week to week in our columns has been fortunate in having the woods and fields and rivers as artistic accessories of the picture. If this has been such as to delight his own eye and the eyes of his friends, due consideration should be accorded the background before which he has been posed.

In the field, doubtless most men are at their best. The day out of doors has for its single purpose a good time—freedom from the vexatious and petty worriments of the office, counting-room and dwelling. If a man is sulky with his gun on his shoulder and his dog by his side, you may set him down, first, for a morose old misanthrope, and secondly, for an idiot. And then, unless you are willing to be an idiot yourself, stay away from that man's home. Sportsmen in the field are understood to be jolly, good-natured fellows. They may be tired, wet and hungry, lacerated by thorns, and black and blue with bruises and falls; their powder and shot may be gone, and their game bag empty; but so far as our knowledge goes, the cheery tone of voice and the ready smile are never absent. The tone of the sketches sent to us invariably give evidence of the shooter's and angler's good nature. And so the reader of the FOREST AND STREAM, who shall form his conception of the ideal American sportsman from the data afforded in its pages, must regard that being as a pleasant fellow, just the companion for a morning tramp or an evening chat about the hearth.

Quite unwittingly on our part, and perhaps unconsciously too, so far as the writers are concerned, the sportsman as a type has been painted in other colors by some of our later contributors. The plaints of our fair friends, the sportsmen's wives, which we have published of late, show something of the other side of the sportsman's character. They have shown him so eager to "Away to the woods, away," as to disregard, or at least to think lightly of, the inconveniences of the ones at home, and so fond of dog and gun as to ignore the proprieties and little delicacies which make the ideal home what it is. The ardent sportsman may be an inconsiderate husband.

The pleasure of a day of field sport is dearly bought if it be at the expense of the finer feelings, and the little felicities of life. The sportsman is a grand character; the gentleman a grander one. No man is great to his *valet*, but the true gentleman is as much of a gentleman in his own family at home as among acquaintances and newly made friends abroad.

THE PUBLISHER OF THE LONDON "FIELD."—Judge Horace Cox, who died in England the other day, at the age of seventy, was a busy man. In addition to his laborious legal duties, he had during his life written several text-books in law, a work upon elocution, and many learned and logical pamphlets in defense of spiritualism, in which faith he was a devoted believer. He was also President of the Psychological Society. His experiences in journalistic enterprise were of the happiest kind. The *Law Times*, which he established and edited for many years, brought him a large income. Some twenty-five years ago the London *Field*, then edited by Mark Lemon, was struggling along in a poor kind of way. Cox bought it. A country surgeon, named Walsh, had just published a book on dogs, and another work displaying much knowledge of country life. Cox put Walsh at the head of the *Field*. Special editors were called in, tales of travel were invited, a corps of reporters organized, and the paper put on a new basis. The income now derived from the *Field* is $100,000 per annum. Eighteen years ago Mr. Cox did essentially the same thing with the London *Queen*, which was then in a languishing condition. The price paid for the property was trifling. To-day the paper pays $50,000 a year. The total annual income derived from his various newspaper enterprizes by this successful publisher, is estimated to have been between $200,000 and $250,000. He had the journalistic faculty of judging the public's taste in literary matters, and he was equally successful in catering to that taste.

SCHOOL FOR WING-SHOOTING.—Capt. Adam H. Bogardus has done New Yorkers a novel favor in opening for their benefit a shooting school, at No. 20 Eighth street. A large roomy hall has been secured and arranged with screens and covers especially for the sport of the wing shooters of the city. It is in fact, a place where practical instruction may be given and received on shooting at flying objects. The arrangement is to furnish a series of traps from which glass balls may be sprung, and under the eye of the Captain young men and others may learn the art of wing-shooting, the correct method of carrying and handling the gun, and the other details which go to make-up the model field shot. On Wednesday evening of last week the Captain opened his new gallery to the public, and there was a gathering of the many friends of the Captain to see him fire the opening shots. Five traps had been placed in position, three of them along the edge of an old stage, and a pair on the main floor, in such position that balls from them were thrown in a low raking reach along the stage floor. All the traps were of the Bogardus pattern, and one who learns to shoot over these may not fear any other make of ball throwers. A broad canvas sheet back of the stage upon which the glare of a calcium light was directed, brought out the flying globes in sharp relief. The Captain fired first at 100 sprung from either of the five traps, then at twenty-five doubles, and then followed some fancy shots in which he pulled his own trap, and again turning his back to the trap and turning and shooting at the same instant. Dr. Bower Talbot, who is second only to the champion himself as a wing-shot, then stepped to the score, and brought his clear English eye to bear on the balls, shattering them in fine style. Others tried their hands at the work, and all pronounced the facilities first class. Classes are now forming, and a large demand has been made for practice by city men, who bring their own guns, and fire a few dozen shots to acquire dexterity and quickness in the manipulation. Colonel Gildersleeve and other fine shooters have begun to avail themselves of the privileges of the gallery, which is within easy reach of all parts of the city and Brooklyn, by the Elevated Rail Road Station at Ninth street. In the purchase of a new gun, there is no other place in the city where it can be taken and a practical test applied at fifteen and eighteen yards rise. Since the opening there has been a liberal attendance, and a continuous consumption of glass-ware. Preparations are now making for the great match against time, which the Captain is to undertake on Saturday next, and of which a full report will appear in the next issue. A card in our rifle columns from Captain Bogardus invites criticism, and should the feat of breaking 5,500 glass balls in 450¼ minutes be really done, it will give the gallery a prestige and make it a more popular resort than it has already grown to be.

Captain Bogardus will perform on Saturday, next, at his shooting school (the old Tivoli Theatre), No. 20 Eighth street, the most difficult and skillful feat of marksmanship, coupled with endurance, ever attempted, and one which will probably never be excelled. He will load his own gun, and break 5,500 glass balls within 7 hours, 30½ minutes, sprung from two traps. This will beat all known records, and will probably never be again attempted by any man. Shooting will commence at 3 o'clock P.M., and continue without intermission. Parties desiring to witness the performance must take the elevated road for Ninth street station, or the Second, Third, or Fourth avenue horse cars for Eighth street.

TEXAS AS A WINTER RESORT.—Our interesting and reliable correspondent, Mr. Sam. M. Johnson, of Corpus Christi, Texas, known to our readers by the familiar signature of "Bexar," speaks very highly of that region as a winter resort for sportsmen and for consumptives. The former may find abundance and variety of game, and the latter a salubrious and equable climate. Our friend assures us that strangers will find a hearty welcome and courteous attention during their stay. This may be just the place for which so many are now anxiously seeking.

PUCK.—The comic weekly, *Puck*, is one of the newspaper successes of the day. It is the best and brightest of its kind in the world. Keppler can discount Nast fifty-two weeks in the year. We always look for *Puck* in Wednesday morning's mail, and tens of thousands of other people are looking for the same paper in their mail-boxes and on the news-stands. *Puck* has published an Annual, and the funny things in it are enough to make the paving-stones smile. Long may *Puck* live, and never may he grow old.

ALASKA'S RESOURCES.

CONCERNING the prospective value of lands, six honest and intelligent men may entertain as many opinions. Nothing is more illusory than are the undeveloped resources and the capabilities of an unsettled country. Investigating parties, fitted out with the approved facilities for carefully testing a newly acquired territory may give their favorable or adverse decision, based upon what they can see. The truth of their reports is verified by the immigrant who comes after them. This has been the rule in other sections of our own land, and it must apply equally in Alaska. Perhaps the value of no other part of the possessions of the United States has been so much a subject of dispute as has been that of this latest acquisition. Our correspondent, "Pisco," who certainly possesses unusual opportunities for speaking intelligently upon the question, it will be remembered, expressed a decided difference of opinion with Professor Henry W. Elliot, who was sent out by the Government to investigate the territory. Below we publish a reply from Professor Elliott, in which he makes good the opinion which he originally expressed. As neither of these gentlemen are interested parties, save in the highest and most patriotic sense, we are glad to afford them an opportunity of adjusting each other's field glasses, in the hope that our readers and the public at large may in the end have the benefit of the clarified visions:—

Editor Forest and Stream:—

Ah! Mr. Editor, the letter of "Pisco" from his warlike ark in Sitka Bay, has the true familiar ring of pent up souls in Alaska—where energetic men, once within its lonely borders, are so corked and bottled tight for long weeks and even consecutive months, that when they have the opportunity of speaking to and of their fellow men, they do so with a concentrated vim and spirit that is both delightful and characteristic. It is an illustration of the happiest sort, is this sparkling letter of Pisco's.

Now, Mr. Editor, I am asked by your correspondent to come up like a little man, with a card in your next issue, and confess my sins of error to your readers and to himself. This I cannot do, as I understand the law and the evidence; but if I shall ever need a further confession, no monk of old, no matter how jolly or bold, could, or can bring me quicker to prompt repentance than "Pisco" can.

In the first indictment, the Captain says that I am sound in conclusion as to the failure of cereals in Alaska, but he takes issue with me on potatoes. What he says, however, about those tubers of Alaskan growth is not new to me; it is exactly as I have witnessed, tasted, and handled them myself at Sitka; but "Pisco" does not say enough; he does not wait until this potato, "seven inches long, three inches thick," and "not quite ripe yet" (September 17th) has passed a few months of keeping with the best of care in that country and that climate, or anywhere else for that matter. If he had waited and watched this potato, he would have found it rotten at the core, or else a total mass of decay, any time between six weeks and three or four months after digging. Why? Because it never gets "quite ripe" up there, and good reason, too. Thus, you may easily observe, that if the giant Alaskan murphy which the gallant little Captain ate on September 17th, had been reserved for seed next year, the best and fondest hopes of "Pisco" would have come to naught.

Therefore, I say, and I think with entire truth, that you cannot raise potatoes successfully in a region where they will not sustain themselves from year to year.

To make this proposition perfectly clear to "Pisco," let me kindly call his attention to the fact that on my garden plots at Cleveland, Ohio, I can plant cotton seed every spring and rear up and gather handsome bolls of cotton down every fall—that, theoretically, I can grow cotton of healthy stalk and delicate fibre in Northern Ohio; but, practically, it is an utter failure, because it is not as good cotton as that produced in Georgia. So it is with your potatoes at Sitka; "not quite ripe yet," gardener "Pisco"; you can raise them this year from foreign seed, you can dig them, and you must eat them forthwith; you can't keep them and reseed your garden next year. Therefore, I say you are not successful in raising potatoes at Sitka Bay, because you cannot sustain yourself there from year to year with those tubers; and what I say of New Archangel and its environs, is applicable to all Alaska.

"Pisco" does not take any decided ground in regard to the correctness or error of my views as to stock raising at Sitka and Alaska generally, and he frankly says that he don't know enough about the business to question it. Well, let him do as I have done; look about Sitka in company with an old stock ranger from the Columbia or elsewhere, and get that man's opinion of it. It is not a very long story, but I won't go into the details, because your correspondent does not take clean issue with me on that point.

As for those mines at Sitka, that is a long story and it dates way back, years prior to the transfer of the territory; and when the Captain gets away next year he will substantially agree with me in regard to them. If the owners of those mines near Sitka have a valuable vein, then they are in full sympathy with me, because they do not want it puffed outside of their own knowledge but if they are simply doing what thousands of such people are daily engaged at, floating worthless stock, then, of course, I shall merit their hostility.

Now, "Pisco," let me say to you, that just as sure as "three thousand" misguided, unhappy mortals ever get together at Sitka, as you presuppose for argument, that just so sure will they send down regularly to San Francisco, Portland, and Victoria for their potatoes and their beef, as well as the "cereals and the groceries;" and, in conclusion, permit me to cheerfully bear witness to the exact truth of the statements of fact which you make, and at the same time not to question or doubt the honesty of your erroneous inferences drawn from those facts aforesaid. A merry, merry Christmas to thee, "Pisco!"

HENRY W. ELLIOTT,

Smithsonian Institute, Washington, D. C., Dec. 5th.

A REALISTIC PAINTING.—Mr. Gerard R. Hardenburgh, of New Brunswick, N. J., who is well known to many of our readers, exhibited in our office last Tuesday an oil life-size painting of a pair of ruffed grouse, or pheasants, illustrated from a new standpoint of artistic view. The two birds stand on the *qui vive*, yet do not seem flustrated. There is something in the wind, plainly—some sportsman and his dog just over the bush, not seen, but fairly suspected. The old hen shows implicit confidence in her pinioned lord, and the lord himself is positive of his ability to whirr away out of danger at the right moment. We have no doubt, however, that the instant they lift themselves clear of the ground they will be dead birds. As it is with these grouse, so it is with humans. They think themselves fairly out of the woods when it is not even time to whistle. Death comes to us when we least suspect his presence; but if we could only see ourselves at the instant of demise, as others see us, we should be impressed with the conviction that the taking off was more of our own folly than a deliberate device on the part of the enemy. There are few painters who succeed in presenting the real so faithfully that the ideal stands behind it like a shadow in the sun. Mr. Hardenburgh, we think, is one of those to be congratulated.

THE TRIP TO PARMACHENE LAKE.—An unusual haste in the preparation of the matter for the FOREST AND STREAM last week was the cause of several typographical errors in the excellent sketch contributed by Mr. W. H. Robbins. To relieve the writer of an undeserved charge of carelessness, we make these corrections:—For black swallows, read bank swallows; viparia, read riparia; toll road, read tote road; our being out, read one being cut; lidge, read ridge; three rounds, read three pounds; *Abrus balsamea*, read *Abies balsamea*; Ohandiere, read Chandiere; his track, read her track; some slata, read some slate; betula, lutea, lenta, papyvacea, read betula, lutea, lenta, and papyracea; quelder rose, read guelder rose; *Viburnum apulis*, read *Viburnum opulis;* elapsed, read elapsed; our trapper, read a trapper; our canvas canoes, read their canvas canoes; patch of maiden hair fern (*Heracleum lanetum*), read patch of maiden hair fern (*Adiantum pedatum*).

CHILDREN'S AID SOCIETY.—Christmas will be all the happier for ourselves when it comes, if we have given our share towards making the day a happy one for others. The Children's Aid Society is one of the many New York City charities which are doing a good work. If any of our friends, either in the city or in the country, feel moved by the kindly impulses of the season to contribute money, clothing, or food to the little waifs who sleep in the cold nooks and corners of the Metropolis, they may send such contributions to Mr. S. C. Brace, the secretary, No. 19 East Fourth street. We can personally vouch for the proper disposal of such gifts.

INDOORS ARCHERY.—The gallery rifle shooting is more extensively participated in by city riflemen than out-of-doors range shooting. There is every reason to suppose that archers will practice a great deal during the winter months in indoor galleries. We shall be pleased to receive and publish scores of this winter work. If the different clubs would make their ranges, targets, and other conditions similar, the reports of the work of each would become interesting by comparison with others.

OUTCROPPING OF THE SPIRIT.—Our indefatigable contemporary, the *Spirit of the Times*, is preparing for another especially attractive Christmas number, of which the chief feature will be a story by Wilkie Collins. The Spirit is always particularly vivacious and sparkling at these Holiday times.

LIVE QUAIL WANTED FOR STOCKING.—There are several prominent gentlemen who wish us to aid them in procuring live quail. Several hundred birds are required. We shall look for assistance from any of our correspondents.

—The female pedestrian barbarity is now being enacted again at the Madison Square Garden, this city. America is the only country in the world low enough in the scale of civilization to tolerate these brutalities. Where is the New York representative at Albany who will win honor for himself by carrying through a bill to suppress these indecencies?

A PEDESTRIAN LUNATIC.—Just after the woman's walk began at the Madison Square Garden, this city, last Monday morning, a man by the name of Patrick Smith, dressed in a suit of his wife's clothes, bounced into the track and ran rapidly around amid the shouts and laughter of the crowd. On his breast he wore the number, 33. He was overtaken by a policeman and taken to the Twenty-ninth Precinct Station-house. He is a lemon-peddler by trade, and is said to be a lunatic on the subject of walking-matches, imagining himself to be a greater pedestrian than Rowell. Why did not the police take the whole gang, male and female, around to the station-house?

—Mr. William F. Duerr, Orange, N. J., offers for sale puppies out of his bitch Gypsy by Sensation.

GAME PROTECTION.

ELEPHANTINE GAME PROTECTION.—The Elephant is going to join the Dodo. One Sheffield, England, cutlery firm alone used the ivory of 1,289 elephant tusks last year. This means that the elephant is being rapidly exterminated for the ivory of his tusk. The subject is attracting serious attention, both among ivory dealers and in countries where this huge beast is invaluable as a means of locomotion and transport.

MIGRATORY QUAIL.—We request those associations and individuals who imported the migratory quail last spring to send us reports of the success of their importations. We are desirous of collecting data for the benefit of a great many other people who are hesitating whether or not to send for more birds this year. Our readers who may have any information about the nesting, hatching, and farther movements of the birds are requested to send in as full accounts as possible. Did the birds nest? Were new broods observed? Where were the birds seen last? What were their habits? How are the importers satisfied?

EARLY GAME LAWS.—We publish herewith a copy of one of the earliest game statutes published in America. Can any of our legal friends send us anything of an earlier date? The law, as given below, is copied by a correspondent from the town records of Bedford, New York, in which it was entered in 1698 by the town clerk, together with other laws passed at the same time. Bedford then belonged to the Colony of Connecticut. It is exceedingly interesting, as showing the early date at which the necessity of game protection received attention in America:—

"An act passed at a Generale Court, held at Hartford, May 13th, 1698, and continued to May 25th, Post Meridien, by adjournment.

"Whereas the killing of Deer at unseasonable times has been found very much to the prejudice of—(word left out.—W. H. B.) Having been hunted and destroyed in great numbers, they are very poor and of little value, and their increase greatly hindered, be it enacted by the authority of this Court, that if any persons whatsoever within this Colonie, from, and after the fifteenth of January, One thousand, six hundred, ninety and nine, till the fifteenth of July, One thousand, six hundred, ninetie and nine, and so from the fifteenth day of January to the fifteenth day of July following annually ever hereafter, shall any way whatsoever kill any buck, deer, or faune, such person or persons shall forfeit the sume of twentie shillings for the first offence, fortie shillings for the second offence, and three pounds for the third offence, and so for every offence after. One moietye thereof to the publick treasurye and the other moietye to him or them shall inform or sue for the same in any Court of Record. And if any persons offending as aforesaid shall not have wherewith all to pay their fines, they shall, for their first offence, worke ten days; for the second offence, twentie days; for the third offence, thirtie days, as shall be directed by the authority before whome the cause shall be heard and determined, to be imployed for the uses before mentioned. And if any venison skinne or skinnes of any buck, dear, or faune, newly killed, shall at any time or times in the aforesaid months, wherein they are by this act prohibited to be killed, be found with or in possession of any person or persons whatsoever, such person or persons shall, to the extent of this act, be held and accounted in the lawe to be guilty of killing deer contrary to the intent of the act, as fully as if it were proved against such persons by sufficient witnesse *viva voce*, except such person or persons doe bring forth who was the person or who were the persons that killed the same. The deputies from the severall townes are appointed to inform the Indians of this lawe that do inhabit in their respective townes, and to indeavour to procure their consent and inguagement to observe the same, and to take the names of all those Indians that doe inguage their observance thereof."

STATE RIGHTS, POT HUNTERS AND JERSEY BLUE LAWS.

WHAT is game protection? It is preventing the killing of game out of season, that is, during the mating and breeding time, and while the young are reaching maturity.

It also looks to the prevention of useless slaughter of game in season, and that it be only taken in a sportsman-like manner, not by snares, nets or traps, but by rod or gun, and then in such a manner as to prevent the extermination of the game or fish.

Generally, game protective associations procure live game to distribute for breeding purposes, in order that the quantity of game may not be diminished, or to introduce some new variety of game.

The various game protective associations differ widely in their work, some being just what they are named, confining their work to a rigid enforcement of the laws, prosecuting those who sell or kill game out of season, and endeavoring to have good game laws enacted for their several States.

The Philadelphia Game Protective Association (of which the writer is a member) is such a one; making little or no effort to distribute live game, its duties being to endeavor to have proper game laws enacted, and rigidly enforcing them.

Some game protective associations are managed on the "turkey and crow" principle. Oh! yes, they treat all alike. Give them their choice, "they will take the turkey, you will take the crow," or if you prefer "you may have the crow, they will take the turkey." They want all the shooting, you may stand by and see them shoot.

The advocates of some of these associations will argue with you to convince you of their fairness to all, and tell you how much they are doing to protect game, and would have you to understand that they make no distinction of any account between residents and non-residents. Such is not true and they know it.

The West Jersey Game Protective Association (of which the writer has been a member for years) no doubt has done much good in various ways, but to say they make little or no distinction between residents and non-residents of the State is false. They make all the distinction it is possible to make.

The fee for a non-resident member for the first year is $5, thereafter each year it is $2. The payment of $3 by a resident of the State shall constitute continued membership. But—and here is where the point comes in—any resident of the State of New Jersey may shoot or fish over the length and breadth of the State *without becoming a member of the association*, just the same as if the association did not exist, while a non-resident must procure a license or be fined for every game bird found in his possession. It is no more obligatory for a resident of New Jersey to join the association in order to shoot game than it is obligatory for him to subscribe to the FOREST AND STREAM. He may join them if he wishes, but is not required to do so. The non-resident must procure a license or stand the consequences. Such are the facts, and so the law reads; about as much difference as can well be made.

The West Jersey Game Protective Association, however, only has jurisdiction in the counties of Camden, Gloucester, Salem, Cumberland, Atlantic, and Cape May.

Without quoting the whole law, which of course, would take up too much valuable space, we insert enough to show how the law reads:—

"*Supplement to an act entitled "An act incorporating the West Jersey Game Protective Society.*"

"Be it enacted by the Senate and General Assembly of the State of New Jersey, that hereafter any person or persons, non-residents of this State, who shall kill, destroy, hunt or take any doe, buck, fawn, or any sort of deer whatsoever, or shall kill, destroy, hunt or take any partridge, moor-fowl, ruffed grouse, commonly called pheasant, pinnated grouse or prairie chicken, or other kind of grouse, quail, woodcock, Wilson or gray snipe, reed bird, rail bird, or rabbit, at any time, or shall catch any speckled brook trout or speckled river trout at any time within the counties of Camden, Gloucester, Atlantic, Salem, Cumberland and Cape May, in this State, without complying with the By-Laws of this Game Protective Society, then the person or persons so offending shall forfeit and pay the sum of fifty (50) dollars each, for each and every offence, and may be proceeded against in any county of this State wherein such person or persons may be arrested, or wherein such offence shall have been committed, and in default of the payment of the forfeit money, with costs of prosecution, any person or persons so offending shall lie in the common jail until the same shall be paid; one-half of the forfeit money shall be for the benefit of the person prosecuting for the same, and the remainder paid to the collector of the township wherein the conviction may be had, and all acts or parts of acts inconsistent with this act are hereby repealed: Provided, that nothing in this act shall prevent residents of this State from taking game or fish, subject to the existing laws of this State.

"Any person or persons, non-residents of this State, wishing to kill, destroy, hunt or take, at any time, any game as provided for in the seventh section of the "Act incorporating this Society," shall first become members of this society, by payment of the membership fee to the Secretary, receiving a certificate of membership, signed by the President and Secretary, and sealed with the corporate seal of said Society.

"The Membership Fee in this Society shall be $5 for the first year, and thereafter $2 for each succeeding year, for non-residents. The payment of $3 by residents of this State shall constitute continued membership."

The game laws of Delaware are worse than those of New Jersey, being barbarous and tyrannical, partaking more of some of the European or Oriental despotism than of part of a free republic; the State laws and also the particular ones applying to the Delaware Game Protective Association being full of the "non-resident of the State" and of "forfeiting gun, dog, etc.," together with "lying in the common jail until the same shall be paid," the latter being a poetical expression common to Delaware State laws in general.

Any resident of the State of Delaware may shoot or fish without a license from the Delaware Protective Association just the same as if the Association did not exist, but every non-resident must procure a license from them or be liable to arrest and imprisonment.

If the Delaware Association required a license for all residents who shoot or fish, they would have a princely income, for in every farm-house there are from one to half a dozen guns; the master of the place has one, every hired man has one, even down to the "cub of a boy" or small nigger who brings in the corn cobs for the fire; each one has a gun, even if it is only a $2 pot metal painted possum-tail barrel.

The writer of this article has spent much of his time in the State of Delaware, and all his father's family are and always have been residents of the State, so he is pretty well posted in Delaware affairs.

To read the game laws of Delaware we would imagine the State was surrounded by savage hordes waiting to rush in with dog and gun and exterminate all the wild fowl and game birds throughout the State, and that even the citizens themselves were in danger.

The writer of this agrees with "A, of Poughkeepsie," that their laws are semi-barbarous, as their game laws are supposed to apply to at least decent people and not to thieves or criminals.

The laws relating to the Delaware Game Protective Association are modeled after those of the West Jersey Association, as see below:—

"SECTION 6. That hereafter any person or persons, non-residents of this State, who shall kill, destroy, hunt, or take any doe, buck, or fawn, or any sort of deer whatsoever, or shall kill, destroy, hunt, or take any partridge, moor fowl, ruffed grouse, commonly called pheasant, pinnated grouse or prairie chicken, or any kind of grouse, quail, woodcock, Wilson or gray snipe, reed-bird, rail-bird, black duck, gray duck, sprig-tail, teal duck, mallard or any other kind of wild duck, or any wild goose, swan, brant, or other wild fowl, or any hare or rabbit, at any time, or shall catch any speckled brook trout or speckled

river trout, or any black bass or other game fish at any time within this State, without complying with the by-laws of this game protective society, then the person or persons so offending shall forfeit and pay the sum of $50 each for each and every offence, and may be proceeded against in any county of the State wherein such person or persons may be arrested, or wherein such offence shall have been committed, and in default of payment of the forfeit money, with costs of prosecution, any person or persons shall lie in the common jail until the same shall be paid; one-half of the forfeit money shall be for the benefit of the person prosecuting for the same, and the remainder paid to this game protective association, and all acts and parts of acts inconsistent with this act are hereby repealed; *Provided*, That nothing in this act shall prevent residents of this State from taking game or fish subject to the existing laws of this State. Justices of the peace in and for this State shall have jurisdiction to hear and determine offences against the provisions of this act.

"SEC. 7. The fee for membership in this society for non-residents shall be $5 for the first year, and for each succeeding year $3. For residents of this State, the membership fee shall be $2 for each and every year; and no resident of this State shall have a vote or voice in the deliberations of this society who shall not have paid to the Secretary or Treasurer his membership fee. Any member of the society who permits his indebtedness to the society to accumulate for more than one year, shall be dropped from the roll of membership; *Provided*, He shall have received notice in writing of such indebtedness from the Secretary or Treasurer, and ten days' written notice of the intention of the Secretary or Treasurer to offer a motion for such action at the next meeting. No member so dropped shall be re-instated except by a vote of two-thirds of the members present at any meeting and on the payment of dues. All officers of this society may be removed from office upon a vote of a majority of the members present for any improper conduct or for violation of the constitution or by-laws of this society.

"SEC. 8. That the Secretary may admit persons to membership by letter or ortherwise upon payment of the membership fee, and shall issue to the person becoming a member of this society a certificate of membership, which shall hold good for one year from the date of the certificate.

"SEC. 9. That every member of this society shall be empowered to make arrests without warrant of any person or persons who may be found violating any of the provisions of this act or infringing upon any laws made for the protection of game and fish in this State, and bring him or them before a magistrate for examination."

If this is not strong enough, just read one of the cards or notices of this Association, found hanging up in the gun stores, and you will wonder if you live in the republic of the United States.

The people of some of our States are so full of the miserable doctrine of "State rights" that they see nothing else. The Delaware people are probably foremost in this. The Jerseymen are still afflicted with the same disease, but not to so great an extent.

When these "State Rights'" people get on the subject of game laws, they imagine they are to be completely "cleaned out" of their game by the residents of their neighboring States, whom they seem to regard as a nation of pot hunters and game exterminators, forgetting the fact, that the exterminator of game lives in their very midst.

This is the root of the whole matter: it is the pot hunter in the country who destroys the game. It is not the resident of another State, who comes for a few days' recreation and shooting; but the fellow who lives in their own neighborhood, who shoots the covey on the ground, and kills all he can, and in any way. As he ships them to market, the more he kills the more money he gets; and he would be a big fool if he did not kill all he could. He is the fellow to look after, not the visitor from another State, who is, most probably, a stranger to the ground, and cannot find half the game thereon. The pot hunter can; he knows the ground well. You are used to seeing the pot hunter around, for he is a neighbor and an acquaintance. You know him, and say nothing to him; while, perhaps, you drive off some well-behaved stranger, simply because he is such, imagining that he will kill everything in the neighborhood; while the pot hunter unmolested keeps at it all the time and every day, killing until there is nothing left. He is the fellow that does the mischief. Large cities, like Philadelphia or New York, send out many gunners, but there are few pot hunters amongst them. The pot hunter lives in the neighborhood where the game is. There are more pot hunters in the State of Delaware, from Wilmington down, by tenfold, than ever go to the State from the neighboring ones.

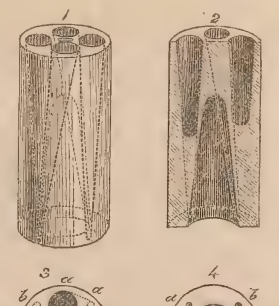
The sooner we get the idea of resident and non-resident out of our minds, and look out for the fellow who slaughters game in any way, in and out of season, who prowls around and bunches the covies on the ground, the nearer perfection will be our game laws.

We want to drop the idea that our neighbor in the next State is a scalawag and a rascal, and that every man in our own State is a saint. If things keep on in the way they seem to be going, the next State Protective Association we will hear of, will have some such section as this:—

"Any non-resident of this State found entering upon the lands of this Commonwealth with dog, rifle, gun, or shooting or fishing implements, shall forfeit the same, together with all ammunition, tools, or implements of hunting or fishing, watch, jewelry, money, and clothing, to the first citizen of this State whom he shall meet. And it shall be the duty of said citizen, of this Commonwealth, to make the demand upon said non-resident, and at once take possession of said weapons, implements of hunting or fishing, watch, jewelry, money, and clothing; provided said non-resident may be allowed to retain one shirt to cover his nakedness, in order that the feelings of the citizens of this Commonwealth may not be offended. And, furthermore, said non-resident may be allowed to retain his boots or shoes to walk in, but shall at once leave the State by the public roads or highways, and shall not trespass upon any path or lane over, through, or under the lands of any citizen of this Commonwealth."

In conclusion, let us drop the resident and non-resident part of the game laws, for the reason that they create an unkind feeling; and for the still weightier reason that, in any State, ten times more game is killed by residents than by non-residents; therefore it is just to infer that more harm is done by the resident shooter. We must not forget, too, that we sometimes go to other States for the purpose of shooting game that is scarce, or is not found in our own; we then become a non-resident, and would naturally feel any discrimination on that account.

When we insert the resident and non-resident clause, it is like knocking down the wrong man when attacked—we allow the rascal to go free, and punish the innocent.



Both in Delaware and West Jersey the non-resident must pay for shooting. The resident does not pay for shooting, but only joins the Protective Association for the purpose of identifying himself as a member of the Association, and, because he is interested in its results. He may shoot all the time in season without paying one cent. RUPEE.

—Mr. Wm. L. Force, the editor of the Plainfield, N. J., *Constitutionalist*, has always been an active and intelligent advocate of game protection, and to his efforts the sportsmen of New Jersey are largely indebted for the present excellence of the game law system of the State.

The Rifle.

SMOOTH-BORE CYLINDRICAL BULLETS.—During the last twenty years we have examined a great many plans for effecting the rotation of a cylinder of lead in a smooth-bore by means of internal or external rifling, but in every case without any good result. At length Dr. Macleod, a retired Indian medical officer, residing at Yockleton Hall, near Shrewsbury, has succeeded in effecting this object by the simple expedient of making the rifled or twisted internal tubes conical, each of the four being reduced from 3-32 of an inch at its mouth, to about 1-64 at its exit on the breech end. The annexed engraving shows the form of his ball of the full size. It weighs 2½oz., and is at present cast of hardened lead; but the inventor proposes ultimately to make it by pressure, so as to eliminate the chance of air bubbles in the casting, by which he thinks the centre of gravity is thrown on one side, and the ball does not maintain its line of flight, as now happens occasionally. Behind the ball he places a thick wad of india-rubber, which effectually prevents the gas escaping through the four tubes, and also from entering the conical cavity at the base, which is intended to throw the centre of gravity forward.

The annexed engraving shows a section of the ball, and also a view of each end. Fig. 1 is a perspective view of

the ball showing the four openings of the tubes in its fore end and their conical form, as indicated by the dotted lines. Fig 2 is a section of the same, showing also the conical cavity in the base. Fig 3 is a plan of the fore end, *a a*, *b b*, *c c*, and *d d*, each indicating, by dotted lines, a rifled or twisted tube, and the amount of obliquity or twist in it. In Fig. 4, the four small openings of the tubes are shown at *a*, *b*, *c*, and *d*, together with the large conical cavity intended to lighten the base.

About six weeks ago we ourselves tried a few of these bullets at 70 yards, with 2½ drs. of powder, and made excellent shooting with them; but the trial was not sufficiently extended to induce us to report it. Last Monday, however, Dr. Macleod obtained the use of Messrs. Holland's range at Kilburn, and also the assistance of his "regulator," whose skill both with the shot gun and rifle is quite A 1. Messrs. Holland had in the interval rebored the gun used chiefly by Dr. Macleod, which is a heavy single barrelled 12-bore, weighing about 8lb.; but we also tried several shots from a double-barrelled 12-bore, with nearly equally good results. From these guns a series of shots were taken with various charges of powder, the conclusion arrived at by all present being: that at 70 yards 2½drs. will suffice to give excellent shooting, but that 3drs. are required for 100 yards, and that beyond that charge the shooting is rendered wild and unreliable. Having settled these points by sundry experiments, we determined to fire the last remaining seven balls with 3drs. of powder from the single barrel, at 100 yards, the result being that six out of the seven shots pierced the wooden target screen, each with a perfectly round hole, and all within a square of 4in.; while one of them (the fourth) was 7in. from the centre of the square, and had turned over sideways, making a hole corresponding with its length in the wood. Here then, we have shooting from a smooth-bore equal to that of an Express rifle, with a ball nearly double the weight of the spherical ball which must be used in the bore, whereby, of course, the shock given would be greatly encreased, but whether or no the velocity would be suficient for an elephant's skull we do not pretend to say, as with a spherical ball in a 12-bore it is admitted that 3drs. of powder are insufficient. In any case, Dr. Macleod's invention is of the highest interest, and opens out problems to be solved, not only with regard to sportsmen, but also for big guns in war, wherein the rifling seems now to be the main difficulty. The balls used fitted loosely but accurately in the gun, and the recoil is about equal to that of an ordinary charge of powder and shot. One of these balls is now before us, and we will leave it at our office for the inspection of our readers. —*London Field, Nov. 8th.*

THE SCHUETZEN CORPS BALL.—The twenty-third annual ball of the New York Schuetzen Corps, Captain D. G. Yuengling, was held Dec. 10th, at the Terrace Garden, the large hall being magnificently decorated with flags, ensigns and banners, among which that of the Corps was given a deservedly conspicuous place. The attendance was very large, the event calling out the wealthy and fashionable element of the German population of the City. The Schuetzen Corps are as gallant in the ball room as they are brave in the field, and the handsome uniforms were never more brilliant than when the epaulets reflected the brilliant light from the chandeliers, and the medals on the breasts of heroes flashed back the rays from the diamonds of the fair ones. The music was under the supervision of Prof. Wannemacher, the leader of the Seventy-first Regiment Band, and was most admirably conducted, German and American airs following each other in a patriotic succession. The impressive feature of the evening was the reception by Captain D. G. Yuengling's Corps of A Company, Third Cavalry, N. Y. S. N. G., Capt. Fisher in command. Marching and counter-marching preceeded the Grand Schuetzen March, dedicated to Capt. D. G. Yuengling, to which one hundred and two couples responded. Then the ball was fairly opened with a waltz and the merriment began. Suffice it to say the order of the programme was faithfully followed and gladness ruled the hour far into the morning.

Notable among the guests of the evening were Capt. J. H. Diehl, of the Independent New York Schuetzen, with a number of his company, the "Jersey Lyric" of the Jersey Schuetzen Corps, Mr. Henry Claussen, Jr., President of the Plattdeutsche Volks Fest Verein, Capt. Busch of Union Hill, who usually weighs 520 pounds, but has fallen away to 480 pounds, and consequently could not wear his uniform; Pres. A. Meyer, Ex-Pres., C. Mattman, with a number of the Helvetia Rifle Club members, Mr. W. Milton Farrow, and Wm. Hays. The gathering was a notable one of both American and German sportsmen, riflemen and sterling good fellows, of both nationalities; and the ball was a most successful and happy affair.

A WARNING FROM CANADA.—The following letter to the manager of the rifle department of the Remington Company speaks for itself:—

Hamilton, Ont., Dec. 20th.—MR. A. ALFORD:—*My Dear Friend:* I had a letter from Ferguson, of Inverness, some time ago, and he has come to the conclusion that the Remington is the rifle of the day, with Hazard powder, some of which I took home for him. At their September meeting he cleaned everything right before him, winning £63 sterling altogether. I never see any of your shooting now. I get the *Herald* every week, but, strangely, there is no Creedmoor news—in fact, any rifle news at all in it. There are none of our club going to Wimbledon next season, so I am going to devote my time to getting up a good team for Creedmoor, so look to your laurels. I have been prospecting lately for new long-ranges, and have struck on favorable ones, where we can have 1,200 yards, if suitable arrangements can be made with the owners. JAMES ADAM.

CENTRE AND RIM FIRE RIFLES.—In reply to a late correspondent of the FOREST AND STREAM, I would state that Frank Wesson makes rifles adapted to both rim and centre-fire shells, by simply changing the striker on the hammer. The Wesson rifles are very accurate, but too straight in the stock for a hunting rifle. The action is simple and safe for ordinary charges, but not strong enough for large calibres and heavy powder charges. The "neatest thing out" in rifles, is the new Remington sliding block action, which is now first offered for sale. The hammer rebounds, and the breech is opened or closed by a lever on the side, without touching the hammer, which stands at half-cock. The hammer is low down in the grip, and projects but very little above the plate, not enough to be in danger of catching on brush or other objects when carefully carried. The stock is provided with a pistol grip, and is well modeled. As a whole, it is the "handiest" rifle I have ever seen, and for beauty, simplicity, safety and strength, is at the head of the list. For fear that this may be thought an interested "puff," I would state that I am *not* the happy owner of the new rifle, neither have I any acquaintance or interest with the Remingtons, but write for the benefit of brother sportsmen. NAUTICUS.

I noticed in your "Answer to Correspondents" of Nov. 20th, that C. J. G. asks the question—"Is there any rifle that uses both rim and centre-fire cartridges?" and you answer, No; but I answer, Yes, for I have owned just such a rifle for the past three years, and like it very much; it was made by F. Wesson, Worcester, Mass. It can be changed to shoot either rim or centre-fire cartridges in about fifteen seconds, and with no more complicated tools than a common jack-knife.

I have taken the FOREST AND STREAM for years, and am more than pleased with it. F. J. DRAKE.

Manchester, N. H., Nov. 28th.

[Our correspondent asked for a rifle to shoot both rim and centre-fire cartridges. A rifle may be changed to shoot either. But there is no rifle now made which can accommodate each class of ammunition without such changes.—ED.]

"BEXAR" AGAIN ON SHELLS.—*Corpus Christie, Texas, Dec. 8th—Editor Forest and Stream:*—Since my first complaint through your columns of the worthlessness of the Everlasting shells, for the Ballard rifle (for which I was so severely rated by some of your correspondents), I have been trying to find out what the trouble was. I

see many others complain of the Everlasting shells, expanding too much to allow them to be used without dressing down, and I have seen no one who can give any good reason therefor.

It is not in my case owing to quick powder, for I use F.G., the same as in my shot gun, and my metal shells there do not expand, although I shoot six drachms of powder and one and a quarter ounce shot in a 10-bore, 10-pound Nichols' gun. But these shot shells are very thin, and therein, I fancy, lies the whole secret. The rifle shells are too thick to contract after expansion. In other respects I am very well pleased with the Pacific Ballard, for although it shoots a ball that must upset to fill the groves, it shoots true every time, and when I miss I know the fault is mine in not holding right.

Is there any other shell made, paper or metal, that will fit a gun bored for the Everlasting shells? If so, I would like to get some. These things are a costly humbug, and the sooner the public know it the better. It seems to me that a paper shell to be shot once and then thrown away would do full as well for a rifle as for a shot gun, and some enterprising firm that would start such a shell could sell many of them in Texas, for the Ballard is a great favorite, but cannot grow into general use on account of these "everlasting" frauds called shells.

BEXAR.

RIFLE TESTS.

Editor Forest and Stream:—

In my letter published in your issue of Nov. 20th, I should have given weight of rifle—8¾ lbs. I should also have stated that the rifle was sighted the same at the longer distance, that is, rear sight was not elevated at all. Last paragraph should read, "indicate greater loss of force by the short bullet in the second 100 yards."

As you have deemed my experiments of sufficient interest to publish, I have thought to detail as briefly as possible another series of tests, but fear I should require too much of your valuable space, will therefore summarize briefly.

Thinking to hunt South several winters ago, I ordered a Remington 40 cal. 28 in.. 5½ lbs. rifle, and 1,500 50-295 grains cartridges. In testing this rifle at 100 and 200 yards, used up several hundred of these cartridges. Could not make a ten shot group at 100 yards, that would measure less than six to eight inches. At 200, could not do better than sixteen to twenty inches. Got disgusted and sold the rifle; it was taken to the Rocky Mountains on a trip of several month's duration, received much rough usage, got badly rusted inside, etc.

Recently I have tested that same rifle with re-loaded cartridges, no lubricant bullets fitting shells loosely. At 100 yards shot ten consecutive shots into a four inch group; at 200, ten into a nine inch group.

Having won a new model Sharps 40 cal. 30 in. 9¾ lbs. rifle; resolved to see what I could do with that. Fired some 70-3.30 grains factory cartridges at 100 and 200 yards. A six inch group at 100 and a thirteen inch at 200 was the best I could do; re-loading with sixty-five grains F. G., same bullet, no lubricant (mouth of shells having expanded somewhat) could make a 2½ inch group at 100, and a five inch at 200 yards.

Thinking this rifle rather heavy for size of bore, I exchanged for a Sharps N. M. Military 45 cal. 9 lbs weight. With factory cartridges it shot very badly, with re-loaded cartridges seventy grains F. G. no lubricant, same bullet, —shells fitting bullet loosely—could shoot continuously into a four inch group at 100, and a nine inch at 200 yards.

One day made group of eight shots each at 200 yards, with the following kinds of powder: Hazard's No. 4, sea shooting No. 3, No. 4, No. 5; Duck, No. 6, Electric, and Dittmar F. As I had previously tested Dittmar, and found there was a perceptible hang fire to all the cartridges, I first placed twelve grains of black powder (No. 3 Duck) in shells, then filled with sufficient Dittmar (weighed) to make same bulk as seventy grains black, which was the weight used of the black kinds; bullets in all these tests the same, 420 grains.

There was but very slight difference in the elevation or size of groups made with the black powder, the No. 4 sea shooting averaging quite as high. The Dittmar cartridges formed a group five inches lower on target, sights of course always the same. Have shot several groups with Dittmar F (tested) powder; same bulk as black; have always found the elevation to be remarkably uniform, but always several inches lower than that of black powder; groups about the same size. I found this rifle, with 70 grains F. G. powder, 420 bullet, had a drop of 17 inches between 100 and 200 yards.

Having tested this rifle thoroughly, I next took up the Peabody Martini military, 45 cal. 8¾ lbs. weight. Have tested three of these rifles; they all shoot factory cartridges (85-480 grains) very fair. Have fired ten consecutive shots from each of these rifles, 200 yards; reloaded shells, no lubricant, 100 grs., F G powder, 410 bullet; groups measured 6⅝, 7¼, 8½ respectively. With this cartridge the drop between 100 and 200 yards was only 14 inches. This is decidedly the best result I have been able to get so far.

I have fitted one of these rifles with sporting stock; it now weighs but 8 lbs., and shoots quite as well. The recoil is about the same as an 8-lb. shot gun with medium charge. For a hunting cartridge I use a round linen patch over butt of bullet of a size to extend ½ inch around the butt; this holds the bullet securely in shell and does not in the least impair accuracy.

I shall next experiment with the express bullet, of which I may give an account at some future day.

Apropos, I have from time to time heard of serious accidents from uncapping loaded shells that had missed fire. Have had some narrow escapes myself. The proper remedy for this is to use only such shells as have a central aperture through the head, and to always knock off the primer from the inside. It is a very easy matter to get a miss-fire cartridge among one's empty shells, and the chances are more than even that it will be uncapped before it is discovered, with a great risk of accident if the outside punch is used. The Winchester Arms Company and E. Remington & Sons' make all have the central aperture. They make all sizes, I believe.

Rhode Island, Nov. 27th. RABBETH.

MASSACHUSETTS—*Boston.*—Magnolia Gallery has been well patronized during the week, and remarkable scores have been obtained, particularly by Edwards, Hollis, and James, whose respective scores of 49 each show perfect holding. These scores were made in the new match, called the Marksmen Badge Match, open to all comers, for which three very handsome silver badges are offered. The military match has also been largely shot, and will close one week from Monday, or December 17th. The following are the best scores made during the past week:—

THE MILITARY MATCH.

Private Spofford, Company A, Second Regiment	4	4	4	5	4	5	5	5	5	5	5—46
Private Gardner, Company D, First Regiment	4	5	5	5	4	5	4	5	4	5	4—46

Boston.—Walnut Hill, Dec. 10th.—The sixth annual competition to-day in the long-range "carton" match did not fill so largely as usual. The day opened cold, with a moist atmosphere, which made out-door sport exceedingly disagreeable. The wind from the northeast sent a chill through the marksmen, and they did not enter into their favorite pastime with their usual zest. The shooting began promptly at 11 o'clock at 800 yards. The signal flags gave no indication of the "fish-tail" wind which prevailed, and were not disturbed as they clung to the staff. Brown, Jackson, Webster and Nichols opened with good centre "cartons," and the shivering scorers—who sat round a camp-fire—looked for big results, and, indeed, the shooting was capital at this distance, Webster and Jackson closing for 81 each, Brown for 80, and Nichols for 76, the Creedmoor count of which would have been: Webster, 73; Brown, 73; Jackson, 72; Nichols, 69. When the gentlemen moved back to 900 yards there was a decided change in the elements. The thermometer indicated 39 deg., and the cold weather sent the bullets low. Elevations were constantly changed, and, to add to their troubles, the wind suddenly changed to 4 o'clock, and blew a little gale. The perfect calculations of Jackson, Webster and Nichols sent them on their first shot inside the carton ring, with Brown in the "bull." "Not so hard a wind to handle, gentlemen, as I expected," said one of the participants, but before the shooting was finished at this distance, the "mag" was shown several times for Webster and Jackson, while for Nichols, the "raven" tried to hide behind the signal disc for a poor two. Brown closed with the highest score, 78; Creedmoor count, 72, at 1,000 yards. The weather conditions remained nearly the same, with the exception of the light, which was very poor, and a fine mist, making good sighting almost an impossibility. Nichols started the ball with an "inner," Brown with a "bull," Webster with a "centre," and Jackson with a "bull." On Webster's second shot the iron did not respond, and the shot could not be located. Jackson followed him on his fifth shot, both being "unaccountables." Hard luck followed both Nichols and Jackson through this distance, but Brown stuck well to his work, and closed with a brilliant 216, Creedmoor, or 232, carton count, which, under the circumstances, was worthy of especial mention. The following summary will give the detail:—

J. F. BROWN.

800	6	5	6	6	4	6	5	5	4	5	5	6	6	6—80
900	5	6	4	4	5	4	6	5	5	6	6	6	5	5	6—78	232
1,000	5	5	6	4	4	4	4	5	5	6	5	5	5	6	5—74	

CAPT. W. H. JACKSON.

800	6	5	6	3	6	4	6	6	6	6	5	5	5	6—81	
900	6	3	6	5	5	4	5	4	4	6	5	3	3	6	5—70	223
1,000	5	5	5	6	0	5	6	6	5	6	6	6	3	3—72		

D. WEBSTER.

800	6	5	6	6	6	5	6	6	6	6	4	5	4	6	5—81	
900	6	5	5	3	4	6	5	5	5	6	5	5	3	5	3—73	218

1,000	3	6	6	3	3	4	5	5	4	6	4	6	5	3	5—66	

CREEDMOOR COUNT.

	800 *Yds.*	900 *Yds.*	1,000 *Yds.*	*Total.*
J. F. Brown	73	72	71	216
Captain W. H. Jackson	72	68	66	206
D. Webster	73	65	63	201
J. Nichols	69	64	62	195

Medford, Dec. 13th.—The attendance to-day was large, and the comfortable winter shed was filled by the marksmen who participated in the classified United States coin match at 200 yards, off-hand, new count, as adopted by the Medford Amateur Rifle Association. The weather conditions were not of the best, but the light for this distance shooting was good, and splendid results were achieved, as the score indicates:—

W. Charles	5	6	5	5	5	6	6	6	6	6	6—56
F. Hollis	6	6	6	5	6	6	6	5	5	5	5—56
E. Whittier	5	6	5	5	5	6	5	5	6	6	5	54
A. B. Archer	5	5	6	5	5	6	6	5	5	6	5—54
R. Abbott	6	5	5	5	6	5	4	6	6	5	5—53
N. Chase	4	4	5	5	6	6	4	5	5	4	6—48
J. E. Irving	6	5	5	3	5	4	6	3	5	6	4—48
N. P. Ames	4	4	5	5	5	5	4	6	4	5	4—47
R. Sherman	6	5	5	5	3	5	5	5	5	3	4—47
A. N. Webb	3	6	3	4	4	6	6	6	5	5	4—43

According to the regulations of the match the clock was won yesterday by Mr. E. Whittier, although the highest score was made by Mr. W. Charles.

Hopkinton, Dec. 9th.—The Hopkinton Rifle Club held a match at their range, at Claflin's Grove, Saturday week, it being the first of the two matches for the ammunition prize, the conditions of which are fourteen rounds, off-hand, at 200 yards; each one entering to be handicapped from the score of the last match, re-entries being permitted. The conditions were very unfavorable, the light being bad; a thick fog hung over the target, rendering the little bull's-eye almost invisible, which with the heavy falling mist and a raw east wind made it disagreeable for the marksmen as well as unfortunate for good scores, the best being given:—

O. Wood	3	5	4	5	5	4	3	3	4	5	4	5	5	1—58
W. B. Claflin	3	4	4	4	4	4	4	5	5	1	5	5	4	3—57
F. S. Phipps	4	4	5	3	4	4	4	4	5	3	3	5	3	4—54
P. W. Smith	4	4	4	3	4	3	5	4	2	4	5	4	4	4—54
C. H. Frost	4	3	3	3	4	3	3	4	3	3	2	2	2	3—41
C. H. Rose	3	3	3	2	3	3	3	0	3	4	4	4	0	4—39

BOSTON MAMMOTH RIFLE GALLERY.—*Dec. 12th.*—The regular monthly prize shoot is progressing finely, and the second week saw better shooting than the first. The management propose to inaugurate the new year with a new rifle match called "The New Year Rifle Match." Five or more prizes will be given away; no entrance fee charged; conditions of the match, the three best scores in the month; also in addition an extra prize of $20 given for a clean score of eight consecutive bull's-eyes. The prizes will be announced hereafter. The following is the summary of last week's shooting, 150 feet; rounds 8; possible 40:—

U. A. Pollard	5	5	5	5	5	4	5	5—39
C. Edwards	5	5	5	5	5	5	4	5—39
N. G. Stone	4	4	5	5	5	6	5	5—38
E. F. Richardson	4	5	4	5	5	5	5	5—38
A. O. Staples	5	5	5	5	5	4	4	5—38
E. F. Bassett	4	5	5	5	5	5	5	4—38
N. W. Arnold	5	5	5	5	5	4	5	4—38
A. E. Robbins	5	4	4	5	5	5	5	5—37
H. R. Shaw	5	4	4	4	5	5	5	5—37
G. J. Seabury	5	5	5	4	5	4	4	5—37

Gardner, Dec. 13th.—The Rifle Club is arranging for a prize shooting-match at their range Christmas Day. The scores of ten shots each are to be required. All who desire are invited to participate.

HELVETIA RIFLE CLUB.—At the general meeting of the Helvetia Rifle Club, which was held last week, the following officers were elected for the coming year: Albert Meyer, President; R. Heuber, Secretary; Sam. Rey, Treasurer; A. Knöpfli, Rob. Faber, Shooting Committee. Mr. C. Mattmann, the resigning President, who served for a term of five years, was presented with a handsome cane with gold handle, and bearing the inscription: "Mattmann, from the Helvetia Rifle Club. Souvenir to their President, for meritorious services."

Game Bag and Gun.

GAME IN SEASON FOR DECEMBER.

Moose, *Alce Americana.*
Caribou, *Rangifer caribou.*
Elk or wapiti, *Cervus canadensis.*
Red or Va. deer. *C. virginianus.*
Squirrels, red, black and gray.
Hares, brown and gray.
Wild turkey, *Meleagris gallopavo.*
Pinnated grouse or prairie chickens, *Cupidonia cupido.*
Ruffed grouse or pheasant, *Bonasa umbellus.*
Quail or partridge, *Ortyx virginianus.*
Woodcock, *Philohela minor.*

Swans, Brant, Wild Ducks, Geese, &c.

☞ This table does not apply to all the States. It is meant to represent the game which is generally in season at this time. State regulations may prohibit the killing of some species of game here mentioned.

BAKER DOUBLE-BARRELLED SHOT GUN.—Many persons have gained the impression that Mr. W. H. Baker, of Syracuse, makes only the three-barrel gun—a two-shot shot gun with rifle accompaniment. This is incorrect. Mr. Baker probably makes five double-barrel shot guns, where he makes one shot gun and rifle combined. This we answer to several correspondents. The Baker $35 double guns are of as fair quality as any low-priced gun made. Indeed, the manufacturers use but one material for all grades, barring wood in stock and barrels.

—Captain Bogardus has established a series of matches to be shot at his gallery. The first, which will be reported in our next issue, was shot on Wednesday, Thursday, and Friday, December 17th, 18th, and 19th, at glass balls, with shot gun. For this the Captain offers a medal to be shot for by amateurs under the glass ball rules—twelve or more must enter—to use any ten or twelve bore gun with cartridges loaded with Dittmar powder, to shoot at twenty glass balls each day to save his entry money and win the medal. The second, third, and fourth best score to receive the balance of the money, fifty, thirty, and twenty per cent. respectively.

A novelty will be introduced on Friday, December 26th, in a match for the championship of America for glass ball shooting with rifle, open for all comers.

To establish the above championship, the Winchester Repeating Rifle Company offers a valuable medal to be shot for under the following rules, to govern match and medal, which each of the candidates entering are required to sign.

We, the undersigned contestants for the badge of the championship of America, given by the Winchester Repeating Rifle Company, do hereby pledge ourselves and agree to the following rules and regulations whenever and wherever said badge is contested for:—

I. The winner shall pledge himself to shoot any challenger, for a sum not less than $100 a side, within two months of the date of said challenge, under penalty of forfeiting said badge.

II. Any party challenging the holder of this badge shall make a deposit of $50, as a forfeit for a match of $100 a side, in the hands of the editor of the *Clipper*, to be covered by the challenged party with an equal amount; the balance of the money, $50 a side, shall be deposited in the hands of the editor of the *Clipper*, or some other party mutually agreed upon by both parties, three days before the match is shot; the match then becomes play or pay. In the case of the holder not complying with the foregoing conditions, he shall forfeit the badge to the party challenging.

III. Every contestant for this badge shall pledge him-

self to contend for the same under the Bogardus Rules for Glass-Ball Trap Shooting, with Winchester rifle, and the balls to be sprung from Bogardus' Glass-Ball Trap for rifle shooting.

IV. All matches for this badge shall be at 100 glass balls, Bogardus' patent.

V. The holder of this badge shall name the place where the same shall be contested for; balls to be furnished by the holder of the badge; each shooter to pay for the balls he shoots at. Balls to be taken from one barrel or box until the same is exhausted, and so on through the match.

VI. The party holding this badge for one year against all comers, it shall become his personal property.

The Bogardus Rules for glass-ball shooting with rifle, have already appeared in the FOREST AND STREAM.

No. 20 Eighth street, New York, Dec. 13th.—Editor of Forest and Stream:—Having accepted a proposition to eclipse all known time and endurance records with a shot-gun, the match to take place in this city, Dec. 20th, will you permit me to make a special public request that every one who may have heretofore entertained any doubt as to the fairness of my performances will come promptly forward on this occasion and avail themselves of the opportunities I earnestly desire all should have, to be convinced beyond any doubt that every condition is complied with. This will probably be my last attempt in a match of this kind, and I wish the record I make on Saturday next to stand unrivalled and undisputed in every particular, and am therefore anxious to afford all doubters every facility they can demand to take exceptions to any point prior to or during the match.

A. H. BOGARDUS.

IT MIGHT HAVE BEEN.—*Rochester, Dec. 11th.—Editor Forest and Stream:*—Seeing so many accidents chronicled tempts me to give you the particulars of what might have been an accident, and what, I presume, is the cause of many unexplained accidents. On the 1st day of January, 1879, I loaned a single-barrelled gun to a young man to go fox-hunting. He loaded the gun himself. I did not get the gun back until the latter part of September last. He returned it, saying that the same lead that he put in on Jan. 1st was still in the gun, and that he had never fired it off. On examination, I found that the barrel had over eight inches of lead or something else in it. After drawing out the shot (my man lost some in drawing it), I had the balance carefully weighed, and found that there was four and three-quarter ounces of No. 7 shot, besides what was lost, which was, at least, one-quarter ounce. The gun still contained over four inches of material, in fact, powder (Hazzard's ducking), which we had to soak out with kerosene oil, and consequently could not be be measured; but I am sure there was at least fifteen drachms of powder in the gun. Now, had that man seen a fox within twenty-five rods he would have shot, and of course the gun would have been blown to atoms and the gunner probably killed, and the whole blame laid to the gun, which is a perfectly safe one, and the writer hereof been blamed for loaning a dangerous gun to the shooter. Moral: Don't loan guns to fools.

L. W.

NEW JERSEY—*Ocean Co., Dec. 8th.*—The shooting around the shore of Barnegat Bay, both for Wilson's snipe and ducks, the present season, has been very poor. Few snipe have been seen or shot. There are a few here now, and in half a day's tramp you might start three or four where in the spring you would see ten times the number. I account for it by the warm weather during the fall in the North. When the birds started they came with a rush, and went directly South without stopping much to feed on the way. Woodcock also very scarce, but quail and grouse have been fairly plentiful.

S. K., JR.

PENNSYLVANIA—*Applebackville, Dec. 7th.*—I, and two other young sportsmen, were shooting around headquarters, in Tinicum township, November 24th, and bagged the first day 37 quail, 15 rabbits, and 5 pheasants, and the rest did very near as good as myself. We were there three days and bagged 250 quail, 137 rabbits, and 28 pheasants. We had some fine sport around the hills. Last Tuesday a deer passed through the town; we all struck out to follow, but could not get a shot. I think it strayed away from the Blue Mountains. S. T. L.

VIRGINIA—*Norfolk, Dec. 9th.*—Weather still holds warm. No heavy rain this fall. More snipe in market than usual at this season, they generally giving the coast line the go-by in fall. Those brought in come from Princess Anne and Currituck. Quail-shooting has been poor, no doubt owing to the extreme drought making the birds stay in the woods and swamps. Swan, geese and ducks plentiful on the Currituck marshes. Canvas-backs are not yet in their prime. W. H. S.

MICHIGAN—*Detroit, Dec. 13th.*—The St. Clair *Republican* reports large flocks of wild turkeys in the vicinity of St. Clair, Mich. A large bald eagle was shot by one of the hands at Perry's Mills one day last week, and sent down to us for inspection. He had been staying around the bay for several weeks, and was shot close to the mill. Though a young one, not having got the white head of an adult, it was a noble bird, measuring seven feet across the extended wings. John E. Long, of this city, was out on the 10th inst. and bagged eight ruffed grouse.

L. F. WHITMAN.

IOWA—*Algona, Dec. 5th.*—Three of us (John, another and myself) shot 289 ducks on the pass at Sprit Lake, in two and a half days this fall. I note your article "An Escaped Prisoner," on page 848. John shot a goose (*Branta canadensis*) one of whose feet was off just above the web, and all healed over clean, leaving a small knob on the end of the leg. L. H. D.

Waterloo, Blackhawk Co., Dec. 8th.—Ducks for some unexplained reason have been very scarce this fall in this portion of the State, there being but two days of fair shooting, which were about the middle of September, during a week of cloudy, rainy weather. The rivers and creeks are still open, but one might travel all day without seeing a duck. Chicken shooting was almost in a fair way to become a thing of the past in this section, but the organization of the Waterloo Sportsmen's Association, with nearly a score of members, and its vigorous prosecution of a few miscreants, makes bright prospects for good chicken shooting in the near future. The quail is our most plentiful game bird, and a marked increase has been noticeable in their ranks during the past two years. BLACKHAWK.

Pomeroy, Dec. 7th.—Cold weather has some time ago driven the game South, and the previous dry weather prevented game from stopping here in any quantity; but several deer have been killed around here within seven or eight miles of town. ABE DACOTAH.

A KICKING GUN.—A La Porte, Ia., gunner was lying in the bottom of a boat, and discharged his gun at some ducks, but not having it firm against his shoulder, the recoil was with such force that he broke his collar bone.

SHOOTING MATCHES.

MASSACHUSETTS—*Brookfield, Dec. 10th.*—Seven of the Sportsmen's Club went out and had a quiet shoot this afternoon, with the following score:—

Mathewson	1	1	1	1	1	0	1	1	1	—9
Capen	1	1	1	0	1	1	1	1	0	0—7
Crosby	1	0	1	0	1	1	1	1	1	—8
Gerald	0	1	0	0	0	0	0	1	0	0—2
Shepard	1	1	1	1	1	1	1	1	1	0—9
Richards	0	0	0	0	1	1	0	0	1	—4
Heredeen	1	1	0	1	1	1	0	1	1	—8
Total										47

CONNECTICUT—*New Haven, Dec. 10th.*—The New Haven Gun Club grounds were opened to-day. The medal has been won twice by each as follows: Folsom, Hanson, Penn, Jorey and Langdon; once by Armstrong, Hutton, Moore and Leete. Following is the score:—

Folsom	11	11	11	11	11	11	11	01	11—10	
Hanson	10	11	01	10	11	11	11	10	—12	
Armstrong	11	11	11	11	11	11	11	01	11—10	
Beers	10	10	10	11	10	10	10	10	10—11	
Longdon	10	11	11	11	11	11	11	11	11—10	
Leete	10	11	10	11	10	11	10	11	10	11—13
Appleton	10	00	10	10	10	10	11	11	11	11—13
Ingersoll	10	11	10	11	00	00	10	01	11	11—12
Jorey	11	11	11	11	01	11	11	11	11	01—18
Merwin	00	01	11	11	11	11	11	11	11	11—17

Ties on medal shoot:—

Folsom	1	1	1	0	1	1	1	1	0	1—8
Armstrong	0	1	1	1	1	1	0	1	0	1—7
Longdon	0	1	1	1	1	1	1	1	1	1—9

—Mr. W. Stone won the Challenge Cup, N. Y. Gun Club, Saturday; score, 9 out of 10. Dr. Wilson and Mr. Godfrey, the former winners, made scores 8 out of 10; good lively birds. Mr. Stone was handicapped 27 yards.

Furs and Trapping.

HANDLING OF PELTS.—*Editor Forest and Stream:*—It often happens that a prime pelt fails to bring a top price to the trapper, owing to imperfect stretching and curing—a fault common to the novice in trapping—and what is thus lost is often gained by the collector, who moistens to a pliable condition and re-stretches and otherwise improves their appearance. Experienced trappers will vary somewhat in details, but the method submitted has stood the test of over thirty years and will be safe to practice. Pelts are stretched in two ways; by casing, as with otter, fisher, fox, sable, mink, etc., and open, as with beaver, bear, coon, and skunk. Either way they are to be cured in a cool, dry, airy place, not exposed to sun or rain. If, as is often the case, open skins are stretched on the outside of a building, they should, as soon as dry enough to keep their shape, be taken under cover and hung up by the head, so the air will circulate about them. In stretching, great care is needed to have the pelts straight and even, and the fat which adheres to those of the bear, coon and skunk, should be scraped off (while nailed up is best) with a dull case knife or its equivalent. Stretchers for cased skins should be made of thin, smooth boards, longer and narrower than the bodies of the animal designed for; so that when the skin is turned flesh side out it will quite easily draw on. The stretcher for mink need taper but little from butt to shoulder, and to a blunt point beyond. Others may taper rather more, and all should be champhered to a thinnish edge equally on the sides. To stretch a skin, draw the skin of the hind legs over the end of the board on each outer corner, and fasten with a nail. Then insert between the skin and board, on both sides, a wedge-shaped point of the length required, and of a size at the butt to take up all slack of skin. Now draw down on the tail and fasten with a nail through the roots into the wedge, and in like mannèr on the other side; thus the air will have free circulation; hang up by a slit cut in the under lip. When partly cured and still pliable, remove the skin and turn it through the mouth, and replace, fur out, for a few days. Should flies be troublesome (though furs are scarcely good enough to take till flies are gone), rub on a little salt around eyes, ears, nose, and lips, and a little at the roots of the tail; but never put salt or alum on the body. If, as it sometimes happens, an animal has died in the trap, so that the skin has got a little turned and the fur starts, it may be washed on the flesh side with a solution of arsenic and alcohol; if arsenic is not at hand, substitute saltpetre. When the weather becomes cold the furs are to be whipped up; that is, take small, tough twigs, or sprouts, and switch the fur smartly, holding a pelt by the tip of the nose. In this way all clotted blood, mud, saliva, or other matter will be removed. Finish by gently shaking in a short, jerky way, and you will raise the pile handsomely. Prime pelts, thus handled, will sell at the top price, and until sold, be viewed with pride and pleasure by the trapper. CORPL. LOT WARFIELD.

ARE BEARS LEFT-HANDED?—Long before the writer tried his 'prentice hand at trapping he was told by a veteran bear hunter that all the bears he had taken in traps—and they were a goodly number—were caught by the left foot. The statement was discredited, till experience seemed to verify it where the traps were set at a coop or its equivalent. Several caught in dead falls also had the left leg as well as the head inside of the coop, the bait being so far back as to oblige them to step inside with one foot to reach it. It would thus seem that where a bear is attracted by a lure he, soldier-like, steps off left foot forward. URSUS.

Women's Column.

FROM OVER THE BORDER.

Editor Forest and Stream.—

As so many of my sisters have had courage to face the enemy, I will also take an arrow out of my quiver, and perhaps the aim may be a true one, notwithstanding the letter that appeared in Nov. 27th of your paper, from one of the afflicted. I have not had quite such a tragic time as "Zena," though in some things have shared a similar fate.

My husband and I have jogged along comfortably for over fourteen years together, except the occasional breaks consequent upon a sportsman's career. It was about nine years ago that we were ordered to an inland town, some thirty miles north of Lake Ontario, a place famous for its fish and game surroundings, also the numerous sportsmen in that vicinity, and from that time up to the past year he has been ever zealous in the sportsman's cause.

First it was fish, for which sport he used to rise at daybreak, paddle down the river some distance, coming home at times with some bass, others maskinonge, which we relished very much.

Duck shooting was next on the programme; before bank hours, and after, (his time being short,) he usually made the most of it, irrespective of the long, lonely, hours I would be waiting and watching for his return, fully expecting every time he would be drowned, or shot such things so often happen; but the reward would be occasionally a few ducks, which were quite a treat. But the crowning feature of all, was the deer hunt every fall. The preparations that for weeks, (aye months,) were gone through with, the numberless times my scrap bag got overturned for pieces to clean and polish up the rod and rifle, until you would almost imagine by the things going around, you were in a gunsmith's shop. If all the fraternity went into many of the affairs of daily life, with the same zest as they do sporting, the wives would have less cause for complaint; labor those times counts for naught, when there is so much pleasure ahead, though alas! the anticipation often exceeds the reality. I fail to see wherein the pleasure consists, in trudging often miles through woods and underbrush, to have a shot at a poor frightened deer just for the sport. Hungry and tired they return to camp, (often disheartened,) but never finding fault because the meals are not ready, but cheerfully go to work, and prepare them themselves, (unless some of them are fortunate enough in having their wives with them,) and oh! such delicious, savory morsels—we poor unfortunates never ate anything with such a relish as they do, out in the backwoods. Perhaps we have no ambition to, either!

The dog nuisance is what has tried my patience most (a virtue few of us get the credit of possessing). I did not keep a memorandum of the numerous pups I helped to raise into passable hounds. The first we had were a pair of dark brown, which my sportsman husband expected to realize $20 on (so he told me at the time); but, alas! his hopes were blasted. The clothes they destroyed off the lines and on, shoes, etc., that were carried off! and one time one of these pets actually took the meat out of the oven while our backs were turned. It was an impossibility to keep them out of the house, as they would slip in in spite of you, and if they were shut up they would howl so dismally the whole neighborhood would be disturbed. Even when they made some pies and cakes disappear that were laid by to cool, all the satisfaction I got was: "Well, put them in a safe place next time." I think they are well named "greedy," as from the quantity of feed that used to be boiled up for them, two or three times a week, one would imagine we kept the contents of a farm yard about us. Then after my months' of trouble with them they were all given to some brother sportsman to reap the benefit of after my toil, not to speak of the nights of sleep we have lost, the scores of times the poor babies have been frightened out of their senses by their discordant cries, which my husband considered as music to his ears, although he generally slept through it all, so of course missed the harmony.

I have never yet accompanied him on a hunt of any kind, for the best of reasons—I have other sport to engage my attention at home; also, I am "gun shy." Nothing would tempt me to level a rifle at any animal, unless in self-defence or necessity.

I have also had some of "Minnie's" experience in getting breakfast and lunches prepared, and rising at unearthly hours to attend to such things, yet I will give my husband credit for keeping all his paraphernalia in good order. He gets powder, shot, tent, and fishing tackle in readiness himself, and I look after the provisions, toilet articles, etc. "Sallie" and "Diana" have, I am happy to say, trained up their husbands in the way they should go, but we all have not that happy faculty. If they were always successful we should not mind so much these disturbers of home comforts; but after such great preparations and months of continued talk about the big hunt, the result often proves a failure. Then it is our turn to talk and theirs to listen, which alters the case considerably; but yet we must have a little revenge, just for the sake of variety.

Our children are fast following in their father's footsteps, and if they are all spared there will be four more sportsmen added to the list; and even our baby-girl, eighteen months old, has a toy gun her brothers made, which she raises to her shoulder and calls "Bang," in the most comical way imaginable.

We have been living here only a year, and his sporting talents have not had much play, as there is no opportunity around us, for which sometimes I feel thankful, as he is more at home; and I tell him it is the best times we have had for years. Yet my joy may be of short duration, as we are not likely to remain here, but may be sent to another inland town.

At one time he was secretary of a fish and game society, and what spare moments were not spent in boating, fishing, and hunting, were taken up till often late in the night in correspondence for the society, until I almost despaired of reclaiming my sportsmen husband.

Still, as "Zena" and "Diana" affirm, we will put up with a great deal of inconvenience when we know they hold themselves aloof from anything disreputable.

Guelph, Ont., Can., Dec, 13th. MARIA.

THE PAST YACHTING SEASON.

SECOND PAPER.

[SPECIALLY COMPILED FOR FOREST AND STREAM.]

IN my first notice of the deeds of our yachts in the now dead and gone season of 1879, I had got as far as the middle of June, and was away up on Lake Ontario, merrily sailing a ten-ton race with the Bay of Quinte Yacht Club. I see I omitted to notice the Empire Yacht Club's racing on the 11th of the month, when fourteen starters, two of them those nondescript catamarans, came to the line, and *H. W. Beecher* won the prize in cabin class; *Martha M.* in the second; *Mary Gibson* in the third, and *Peter O'Brien*, a twenty-foot boat, which was splendidly sailed in a hot squall which diversified the proceedings, in the third. The catamarans outsailed everything, the famous *Tarantella* putting her best hull foremost and waltzing round in great style. Some people admire these craft. I don't wonder at it, for with us the attainment of speed has always been a primary consideration, and so long as we get that we are content to sacrifice every other quality. That is why I like the catamaran—it is the *ne plus ultra* of our national model; it is the *reductio ad absurdum* of the sloop; it is the antithesis of the seaboat, and the more it exhibits its great speed, under certain conditions of wind and sea, and its total lack of accommodation and comforts under all circumstances, the better am I pleased, as it leads me to hope the principle on which, along with the sloop, it is based will be condemned. But of that, more anon. A new sloop, the *Hector*, contended at the East Boston Yacht Club Regatta on the 14th, when in a stiff southwest breeze, and suffering moreover under all the disadvantages inherent to a new and untried yacht, she landed first prize for keels and *Lillie* that for boards. *Sunbeam* was beaten by *Clara* and *Lottie*, the former neatly securing the first prize in second class, and *Elsie* got that in third. There were new boats also in the Beverly Yacht Club Regatta on the same day, at Nahant, and in the second class, twenty-foot boats, there occurred a very interesting contest between *Peri*, of yore champion; *Fancy*, built to beat her, and now meeting her for the first time; *Josie*, built late the year before, and which had a victory over *Fancy* on record, and finally *Hoiden*, a brand new craft, turned out by Pierce Bros., and which proved too good for the lot, as she came in a winner. There was plenty of wind and the sailing was in general very true. The 14th was the day selected by the Royal Nova Scotia for its opening cruise, and a good turn-out there was, with twenty-one yachts answering the Vice-Commodore's signals and working in the fierce rallies of southwest wind in a way to compel admiration. The Chicago Yacht Club had expected to enjoy the sight of a battle royal between *Cora* and *Greyhound* (nee *Annie Cuthbert*), and the Chicago Yacht Club was mushly disappointed, the rivals not turning up, and leaving to *Ina* and *Frolic* the task of keeping up the interest, which they did, *Frolic* beating *Ina* on time.

The most remarkable thing about the racing at Philadelphia on the 16th was the enormous amount of work the crews of the contending yachts had to keep the water out, and the exceedingly neat manner in which a couple of the yachts capsized *à l'Américaine*.

The yachts at Chester, Pa., on the same day, sailed a good race, *Minerva* and *Whitewing* securing first and second prizes respectively. In a soldier's wind from north the prizes at the Newport Yacht Club races were carried off by *Dauntless* in the first class, Mr. W. C. Thompson's new *Clytie* in the second, and by *Keturah* in the third. There was enough of the northwest wind at the Jersey City Yacht Club Regatta to induce the majority of the cabin sloops to wind instead of jibing round Robbin's Reef buoy; and as, with the exception of one short stretch to windward, the direction of the wind made it a reach both ways, the race was very quickly sailed, *Linda* being first in first class, with *Pilgrim* 11m. 15s. behind her. *Knight Templar* sailed over in the second class, and in the third *Jessie Payne*, having turned the buoy on the wrong side, was disqualified, and the prize went to *Willie*.

Great bodies move slowly, especially on this side of the Atlantic, and this is perhaps the reason why the races of the New York Yacht Club are never started on time. On the 19th June, the start was something like a couple of hours late, for no earthly reason that one could see. I, for one, believe in starting a race sharp, being careful to give just the right interval between preparatory and starting signals that has been announced. Nothing is more thoroughly annoying to a genuine racing yachtsman than a long delay, or a short one either, when he is all ready for the word "Go." And the habit of delaying starts soon grows into a tremendous nuisance, and is often the cause of a race being spoiled. Of course, some men, when in charge, and seeing an entered yacht in the distance trying to get up to the line, feel an inclination to "give her a chance," and postpone the signal till she has arrived. That is a very unfair proceeding to those yachts that are ready, and I have seen the destination of the prize changed by it, as wind fell or strengthened, and favored the late comer. If you mean to start at noon, or 1 o'clock, don't advertise ten or eleven as the hour; if you do, stick to the hour, make your signal, and send off the racers present, and let the late birds bear the penalty of their own neglect. There is at least one club in New York waters which sets a good example in this respect, and a good many at other points on the coast. The regatta was open only to yachts belonging to the club, quite in the Royal Yacht Squadron fashion, and in accordance with a custom which has hitherto obtained too largely. However, the New York Club can even thus get up a good race, unlike the swell R. Y. S., which, on more than one occasion, has had but a poor lot of vessels to contend for its splendid prizes. An entry comprising such schooners as *Rambler* and *Intrepid* among the keels; *Tidal Wave*, *Estelle*, and *Peerless*, among the centre-boards; and such sloops as *Vision*, *Regina*, *Vixen*, *Psyche*, *Glance*, and *Volante*, is good enough in point of quality, even if it does leave something to be desired in regard of numbers. There was not a great deal of wind, but what there was blew steadily until the end, so that the horrors of a drift were avoided. The contest between the two big keel schooners was exceedingly interesting, *Intrepid*, conned by Mr. A. Carey Smith, losing, it is true, to *Rambler*, but not until she had made an example of her turning to windward, as well as of the smart *Estelle*. The latter was not good enough for *Peerless*, which sailed in first-rate form, and gave her larger rival such a view of her counter as must have indelibly stamped its shape on the minds of all her crew. *Tidal Wave* met no foeman worthy of her, hauled down her colors, and made a pleasure sail of the race; while *Vision*, similarly circumstanced, sailed over and took the prize for first-class centre-board sloops. *Regina* and *Vixen* made a very close match of it all day, *Vixen* winning by twenty-one seconds on time, her opponent not sailing quite so fast, many thought, under her sloop as under her cutter head-rig. Cutter-rigged *Volante* walked away from *Psyche* all day, and had *Glance* well-beaten when Mr. Ferris struck his flag. One would think that the all-round advantages of the cutter-rig for single masters would by this time be apparent to most racing men, and perhaps next year we may see genuine large cutters, not mere adaptations and imitations. A few good contests, in both smooth and rough water, would do far more to settle the question of relative merits, than all the imaginary descriptions of performances of sloops *versus* cutters, which some people mistake for convincing arguments.

A very encouraging feature of American yachting is the growth of the Corinthian element, which has been sedulously and judiciously fostered by the Sewanhaka Yacht Club, an association that I take leave to consider at the very top of the tree. It has done for us what the Royal Alfred, the premier Corinthian club of Great Britain has done in the old country—shown that gentlemen can handle large and small yachts as well as the tarriest tar. Corinthian matches are wonderfully popular among English, Scotch and Irish yachtsmen, and not only the Royal Alfred, but the Royal Clyde, Royal Mersey and other clubs have encouraged them. Single and double-handed matches have often been sailed across the "herring-pond;" and nothing could better show the skill of amateurs than sailing, single-handed, such crafts as *Peri*, five tons, *Naiad*, ten tons, *Queen*, fifteen, and *Siren* or *Madcap*, twenty, all of them cutters, and two-handed, *Wavecrest*, twenty-five, and *Phantom*, twenty-seven tons. It was in a single-handed match sailed on 1st of June, 1873, under the auspices of the Royal Alfred, that poor Dan O'Connell, one of the best yachtsmen that ever trod a deck, lost his life. It was blowing fresh enough for reefed mainsails, and there was a good deal of sea outside, when five yachts started. They were *Petrel*, ten; *Mocassin*, ten; *Madcap*, twenty; *Torment*, five; and *Peri*, five, the latter with O'Connell on board. *Mocassin* was first to return, having given up, and she was followed into harbor by a sixty-ton cutter, with topmast carried away, and an eighty-ton yawl, with her gig washed away from the davits. This sort of thing boded ill for the Corinthians, and a steamer was despatched to look for them, *Madcap* being met running back, with head sheets carried away, the *Torment* having been driven to Howth, and the *Petrel* alone able to go round the course, *Peri* having foundered. Yachts all the way up to one hundred tons have wholly manned by Corinthians, and have won well-contested races, and on the 21st of June of this year the Seawanhaka turned out *Peerless*, *Kate*, *Vision*, *Regina*, *Vixen*, *Schemer*, *Wave*, *Blanche*, *H. W. Beecher*, *Midge* and *Julian*, with Corinthian skippers and crews, and right well did each yacht bear herself in the fight. There was a jolly whitecap breeze from the eastward and a lump of a sea to try gear, and the yachts were started sharp on time, so that the late birds found themselves handicapped, and learned practically the advantage of being at the line in good season. *Regina* and *Vixen* were at it again, hammer and tongs, just as two days before at the New York Y. C. regatta, and *Vixen* saved her time all the way to Spit buoy, where, just as she was rigging out her spinnaker boom, it snapped, and pitched one of her hands clean overboard. *Vixen* was uncommonly well handled, and the duck picked up in short time; but the delay gave *Regina* the race. But for the accident, it was a moral for *Vixen*, and as far as the result of the two races went, she proved herself the better craft. *Vision* came out with cutter head-rig, and sailed like a witch, and made better time over the course than big *Peerless*; and *H. W. Beecher*, among the third class sloops, fairly astonished everyone by the way she travelled, actually giving *Blanche* the go-by. In this class, *Wave* got the prize, and deservedly, *Schemer* coming in second. *Julian* came to grief, her weather rigging parting, and had to give up, leaving *Midge* to complete the course, and take the prize. A regular good race, taken all round, and justice done to the yachts by the Corinthians.

On the same day the Boston Yacht Club held its first "annual union regatta," throwing open its races, instead of confining them to yachts of its own members. This is undoubtedly a good plan, and tends not only to increase the interest of the regatta by bringing together cracks that would not otherwise meet, but it also conduces to the prosperity of the club itself, and the Bostonians will ere long reap the benefit of their liberal policy. Open regattas have come into favor this year, and to me this is another sign of healthful progress in the noble and manly sport of yachting. Our racing yachts will in future have a chance of "going the round of the regattas," and the comparisons which can then be drawn between the different vessels will promote improvement not only in construction, rigging and equipment, but also in handling. It is simply wonderful what difference half a dozen hard-sailed races make in the discipline and smartness of a crew. Of course, with the increase in the number of such regattas will arise the necessity of harmonizing the fixtures, so as to enable yachts to visit as many of the ports as possible; and here the proposed National Yacht Racing Association will come in most usefully. The Boston Y. C. Club offered twelve prizes to seven classes of yachts, and the smallest entry in any class (the first class sloops) was three, some forty yachts being engaged in the races. The wind was light from southwest at the start, but improved as the day wore on, though a "howling fluke," in the shape of a fresh pipe after a flat calm, materially altered the prospects of the leewardmost boats, and destroyed those of the late windward crafts. Mr. Pfaff's new schooner *Adrienne* saved her time off Mr. Little's smart *Brenda*, the latter being heavily handicapped in the prevailing weather, having to allow the round time of twenty-five minutes—over one minute a mile—to her fleet opponent, on whom, however, she rapidly gained as soon as the breeze came out at all strong—actually reeling off nine minutes of the allowance in a quick burst of two miles and a half—a performance which is, considering the reduction of *Brenda's* spars, nearly as remarkable as that extraordinary bit of sailing performed in August by *Enchantress* at Cowes. The sudden shift of wind—the increased weight thereof—proved too much for the spars and gear of some of the contending craft, schooner *Elfin* losing her topmast, and sloop *Thistle* her topmast backstay, which helped to make her lose the race to *Syren*, the latter taking the handsome silver cup. *Eugenia* parted some gear, and gave up, and *Muriel* performed the national feat of turning turtle, her crew being picked up by *Posy*. Lawlor's sloop, *Viking*, Mr. W. H. Gorman, showed well among the second class keels, netting first prize. She is undeniably a fast boat. By the way, I hear Lawlor has designed a schooner for a Canadian yachtsman, Mr. W. H. Brookfield, Royal Nova Scotia Y. S., and the new craft is building at Port Metway, a place where they know how to turn out fast and handsome schooners. She is to be some thirty-seven feet on the keel, which is rockered, and will have a lot of the "precious metal" bolted on to it; flush deck, low and short cabin trunk, housing topmasts, and altogether an able seagoing craft. It will be interesting to compare her performance alongside *Seafoam*, at present the crack schooner on the Halifax station.

The Halifax men had their first innings on the 21st, too, that being the anniversary of the settlement of the place. The Royal Nova Scotia Yacht Squadron, which represents the yachtsmen of the maritime provinces of Canada, naturally provided the prizes for the three races, all of them sailed under the rules of the Yacht Racing Association, which, I am informed, have given unqualified satisfaction during the season. In the first class the famous little clipper sloop *Hebe*, entered at a higher tonnage, won after a good fight with *Petrel* (twenty) and *Seafoam* (twenty seven) tons. *Petrel*, formerly a very successful racer, had her day—smooth water and a good topsail breeze—but she could make nothing of the small chap, and the difference of model told with a vengeance, the twenty-tonner having a bluff bow, and Butler's sloop an entrance like a knife, clearly proving that the cod's-head and mackerel-tail style is no match for the fine bow and clean line. In the second class *Psyche*, which had been very unlucky, or rather, very badly handled, all the season before, came to the front again, winning as she pleased, with *Phantom*, a new-comer, second. In the third class *Muta*, the Nova Scotian *Freda*, bar the hard weather qualities, disposed of all her rivals without any difficulty.

The Columbia Yacht Club, which is fast assuming a place among our smaller clubs similar to that occupied by the Corinthian Yacht Club on the Thames, held its twelfth annual regatta on the 23d of June, Corinthian crews and no shifting ballast being evidence of the sporting spirit of the members. The wind was light, flukes from southwest, and the prizes went to *Peerless* among the cabin sloops, to *Journeyman* in first class open yachts, and to *Lydia F.* in the second class.

I am afraid my readers will think me as discursive as Tristram Shandy, for I am apt to wander away from accounts of races to remarks on half a dozen different subjects, steering a very wild course indeed, and having to bear up constantly, in order to "return to my mutton," but for the life of me I can't help it. As anything occurs to me, why off I go, and having said my say, once more take up the thread of my narrative, disconnected though it may be. With this apology for all my sins past, present and future, I premise some remarks on classes. There are two things which especially bewilder any student of American yachting records—laws of measurement and classification. Of the former I need not now speak, reserving it for a future digression. The latter is an ever-present nuisance to me and, I doubt not, to many others. It is absurd to talk of first class yachts when there are half a dozen first classes, ranging from schooners of 200 tons to open boats twenty feet long, and second and third classes equally mixed up and undistinguishable. It is very much to be desired that a single, uniform system of classification should be adopted for all yachts sailing under the Stars and Stripes, either on the principal of length or of tonnage, the latter preferably, if a sensible rule of measurement can be devised. If all the clubs would unite in supporting the proposed National Yacht Racing Association, that body might well undertake the double task of devising a sound measurement rule and an intelligible system of classification, in which first class yachts would mean large yachts and not skiffs. In this respect our British friends are undoubtedly ahead of us, with their tonnage classes, and it is as easy to follow and compare the performances of British yachts, numerous though they are, as it is difficult and frequently impossible to do the same with American crafts. I commend the idea to the dispassionate consideration of all my "brethren of the wave" who have the success of American yachting at heart, and who can therefore rise superior to local considerations.

The 24th of June saw the two cracks—*Regina* and *Vixen*—meet for the third time in the season, in the race for the Bennett Challenge Cup for sloops, over the New York Yacht Club course. The *Vixen* had won it the previous year and repeated her former success, beating her rival right through, and so far settling the vexed question of superiority. The wind, at first light, freshened up and came out true and good from south. *Regina*, under full sloop rig, and not sailed at first as she should have been, gave away a lot of chances, making a very poor start, being 2m. 18s. to the bad when she crossed the line. There are few things more important in a race than making a good, clean start, and it is surprising how few yachtsmen, comparatively, pay sufficient attention to this fact; relying, apparently, upon their ability to overtake their competitors, and, instead, finding themselves all in a mess under the lee of a slower boat, while their partic-

ular rival has drawn out of the ruck and is making play ahead. This bad habit is largely due to the prevailing rule allowing yachts so many minutes to cross the line—from five to ten, and even fifteen. It induces men to hang back in the hope of getting a streak of luck or of finishing some operation which should have been completed long before. The practice of counting the time from the expiration of the delay allowed is still worse, and if the plan of starting anywhere between the last signal and the end of the interval is adhered to, all yachts crossing later should be disqualified. Yachts ought to be smartly handled, and lubberliness should not be encouraged as it now is. I have seen all sorts of starts, from the man-killing style of starting with anchors down and not a rag of sail shown, to the ludicrous fashion of giving the time-allowance at the start, which, I see, the sapient managers of the approaching International Regatta at Nice are going to try, and which is still, I believe, in vogue in Bermuda. Well, of all the varieties, there is none which to my mind is fairer for all concerned than the genuine flying start, no time allowed, and every skipper on his mettle to launch his barkie clean across the line and to windward the instant the signal is given. *Regina* and *Vixen*, as I have already said, both made a bad start, the former worse than the latter, and then their respective captains waking up to their work, the two yachts were sailed and no mistake. Do what she would, however, *Regina* was unable to collar her antagonist, and the best she could manage was to reduce the distance between them on the run home, *Vixen* winning by 3m. 23s.

A fresh south-southeast wind played havoc with some of the yachts entered for the Long Island Yacht Club Regatta, the casualties being most numerous among the second class cabin sloops, one of which, *Louisa B.*, gave up, disabled; *Réveillé* and *Lottie* carrying away their topmasts, and *Admiral Rowan* pluckily holding on with a sprung masthead and winning. The new sloop, *Elephant*, built by Ellsworth for Mr. J. G. Prayne, made her appearance in the first class, and won very easily off *Sophia*, sailing quite up to the form expected of her and displaying an agility belying her name. *Excelsior* secured the prize for open sloops, and the cat, *Kate Joralemon*, struggled so successfully under the burden of her name that she beat all the other "pussies," while crossbones, *Tarantella*, walked away from duplex, *Columbia*.

AMONG THE BUILDERS.—Mr. H. J. Bryant of Boston, has purchased the sloop yacht Fanny, built at Mystic, Conn., by Mr. C. H. Mallory. The Fanny is 72 feet over all, 23 feet 9 inches beam and 90 tons measurement.

Rear Commodore Waller, N.Y.Y.C., has ordered the schooner yacht Dauntless to be given a new deck and to be rebuilt in stern. She will also be fitted with a new suit of canvas during the winter months.

The owners of the sloop yacht Gracie intend to put her in first class trim for next season, in order that she may again show her racing qualities. A new suit of racing canvas will be given her.

There are twenty-three yachts laid up for the winter in the basin at the foot of Seventh street, Brooklyn, L. I.

Mr. Henry J. Steers, of Providence, R. I., has ordered a centreboard schooner yacht built at Nyack on Hudson during the present winter. She will be named *Republic* and will be of the following general dimensions:—Length over all, 93 feet; length on deck, 90 feet; length on water line, 82 feet; length on keel, 79 feet; breadth of beam, 22 feet 6 inches; depth of hold, 8 feet 10 inches; draft of water, 7 feet. Her frame, keel, keelson, stern and sternpost, centreboard trunk and outside planking will be of white oak. All knees are to be of hackmatack and oak. Her deck will be of selected white pine, the bulwark stanchions of locust, with top rail of oak. The dimensions of the *Republic's* spars are given as follows:—Bowsprit, outboard, 28 feet; inboard, 8 feet; flying jibboom, 48 feet; foremast, 75; mainmast, 77 feet; foretopmast, 32 feet; maintopmast, 33 feet; foreboom, 26 feet; foregaff, 25 feet; mainboom, 56 feet; maingaff, 29 feet 6 inches. Mr. J. M. Sawyer will furnish the new yacht with working and racing sails from canvas made to order. Her cabin accommodations will be very ample and comfortable. The main cabin will be 14 feet by 16 feet and finished in handsome hard woods. Mr. A. P. Bliven will superintend the construction of the *Republic*, and she is to be finished by the latter part of next April.

The schooner *Siren*, owned by Dr. C. Morrogh, of New Brunswick, N. J., will be lengthened this winter and enrolled in the New York Yacht Club.

Captain E. Willis, of Port Washington, L. I., is building a centreboard and counter stern sloop yacht, 48 feet on the water line, for a tea broker of this city. She promises to be fast.

THE "SUNSHINE."—This tidy little schooner has been recently bought by ex-Commodore Wm. Peet, Atlantic Y. C., and will appear in New York waters next season. She is an excellent and handsome little cruiser of sixteen tons, and about fifty-two feet long.

National Pastimes.

THE GAME OF CRICKET.

PROPOSED VISIT OF AUSTRALIAN CRICKETERS.—Notwithstanding the fears entertained by many persons here that the misrepresentations circulated in England as to the disturbance on the Association Cricket Ground during the second match with Lord Harris' Eleven, will seriously militate against the success of the enterprise, the proposal to send another Australian team to the mother country in March next year is again attracting attention is cricketing circles. Mr. John Conway, who, it will be remembered, acted as agent for the late team, is moving in the matter at Melbourne; but several New South Wales players whose services are almost certain to be required are anxious that the cricket associations of this and the neighboring colony of Victoria should conjointly undertake the duty of selecting the best eleven that can be got together and send them to England under their auspices. The two representative bodies have accepted the responsibility of the task, and in a few days a selection committee will probably be appointed to pick the team, the New South Wales Association having already taken the initiative by nominating Mr. Murdoch to act on their behalf. —*Sydney Morning Herald.*

AVERAGES FOR 1879.

CHATHAM CRICKET CLUB.

The Chatham Cricket Club, of Chatham, Ontario, Canada, is composed, with only two exceptions, of young men not yet out of their teens, and the expenses of the club are borne by the playing members chiefly. Were the game properly supported by the citizens of the town of Chatham, it would not be long before the club would be one of the first in Canada, if not in America. The officers for the year 1879 were:—W. S. Ireland, Esq., President; Andrew Heyward, Vice-President; Charles Atkinson, Treasurer; W. Crowe, Secretary. Unfortunately the bowling averages were not kept in every match, so an analysis cannot be given. However, Messrs. Monck, Nicholls and C. Atkinson have done best service for the club in the order named, while George Beamish bowled exceedingly well in the few matches in which he took part.

Matches were played with the first clubs in Canada, and with the noted Peninsular of Detroit, six matches being won and two lost. The losing games were played wish Detroit and Thamesville, but the tables were turned in the return matches, beating Detroit 46 runs, and Thamesville in an innings and 55 runs.

The following are the official averages for the season:—

BATTING AVERAGES.

Names.	*Innings.*	*Runs.*	*Most in an Innings.*	*Most in a Match.*	*Times not out.*	*Average.*
W. B. Wells, Jr.	6	81	*48	*48	1	16.02
J. L. Nicholls	14	181	38	96	2	15.0
J. L. Bray	4	41	37	37	1	13.66
H. S. Little	11	95	18	26	0	8.7
W. Crowe	12	82	*31	*31	2	8.2
Geo. Beamish	8	48	12	12	2	8.0
Chas. Atkinson	13	96	19	22	0	7.6
E. Bolt	13	80	16	19	2	7.3
John Monck	4	30	14	14	0	7.5
D. W. Eberts	8	55	22	26	0	7.0
H. Atkinson	14	82	23	23	1	6.3
R. H. Monck	14	61	13	21	4	4.5

*Signifies "not out."

STATEN ISLAND CRICKET CLUB.

SUMMARY OF MATCHES.

This club has played thirteen First Eleven, ten Second Eleven, and one Junior, with the following results:—

FIRST ELEVEN.

Date and Place.	*Sides.*	*First Innings.*	*Second Innings.*	*Total.*
May 17, at Staten Island	Staten Island	57	46 (5 w)	103
	St. Georges	99	66	102
Won by 5 wickets.				
May 31, at Staten Island	Staten Island	108		108
	Columbia College	39	43	82
Won by an innings and 26 runs.				
July 4, at Staten Island	Staten Island	109	11 (1 w)	120
	Belmont	66	52	118
Won by 9 wickets.				
July 11, 12, at Staten Island	Staten Island	129	81 (4 w)	210
	Longwood	91	116	207
Won by 6 wickets.				
July 17, at Prospect Park	Staten Island	44	118 (6 w)	162
	Manhattan	102	..	102
Lost by 58 runs on first innings.				
July 21, at Nicetown, Phila	Staten Island	48	59 (5 w)	122
	Young America	172	.	172
Lost by 109 runs on first innings.				
July 23, at Nicetown, Phila	Staten Island	109	..	109
	Fox Chase	137	..	137
Lost by 37 runs on first innings.				
July 23, at Nicetown, Phila	Staten Island	93	40 (2 w)	133
	Chestnut Hill	87	..	87
Won by 6 runs on first innings.				
July 24, at Baltimore, Md	Staten Island	103	..	103
	Baltimore	45	45	90
Won by an innings and 13 runs.				
Aug. 9, at Staten Island	Staten Island	69	64 (1 w)	133
	Manhattan	66	66	132
Won by 6 wickets.				
Aug. 29, 30, at Staten Island	Staten Island	47	43	90
	Hamilton	66	25 (2 w)	91
Lost by 8 wickets.				
Sept. 19, 20, at Staten Island	Staten Island Eighteen	34	102	136
	Gentlemen of Ireland Twelve	135	2 (no w)	137
Lost by 11 wickets.				
Oct. 27, at Staten Island	Staten Island	27	89	116
	New York	16	35	51
Won by 65 runs.				

SECOND ELEVEN MATCHES.

May 15, at Hoboken	12 Staten Island	65	70	135
	12 St. Georges (2d)	62	44	106
Won by 29 runs.				
May 22, at Staten Island	Staten Island	45	37	82
	Columbia (1st)	52	36 (3 w)	88
Lost by 7 wickets.				
June 6, at Prospect Park	Staten Island	197	..	197
	Manhattan (2d)	22 (7 w)	..	22
Drawn.				
June 26, at Staten Island	Staten Island	143	..	143
	Newark (1st)	63	56	119
Won by an innings and 24 runs.				
July 5, at Staten Island	Staten Island	202	..	202
	Columbia (1st)	94	136 (7 w)	230
Won on first innings by 108 runs.				
July 16, at Nicetown	Staten Island	126	..	126
	Germantown (2d)	111	..	111

JUNIOR MATCH.

Aug. 2, at Staten Island	Staten Island	81	57	138
	St. Georges	1	19	20
Won by 118 runs.				

RECAPITULATION.

	Won.	*Lost.*	*Drawn.*	*Total.*
First Eleven matches	8	5	0	13
Second Eleven matches	4	5	1	10
Junior match	1	0	0	1
Total	13	10	1	24

Thirty-three members played in first eleven matches, twenty-nine in second eleven (of which eighteen in first also), and eleven in a junior match (one of whom in second), making in all fifty-four who have taken part in games.

It will be seen by the following average that the batting of both first and second elevens shows a fair improvement over last season, but the bowling has been less effective.

BOWLING AVERAGES.—1. L. Haughton, .33; 2. Poole, 1.25; 3. Carroll, 2.25.

The above is compiled from the Secretary's official report.

DAFT'S AMERICAN TOUR.—Richard Daft, captain of the American team, was present at the annual dinner of the Notts Castle Cricket Club, held at the Maypole Hotel, Nottingham, last Saturday evening, (November 15th,) and made a long speech in response to the toast of his health and that of his men. Referring to the start, Daft said that for several years past he had received invitations from influential people, not only in Canada but in America, to take out a team, but as innumerable difficulties presented themselves he was compelled to defer the visit until the back end of last season. Even then he could not have gone, but for the great influence exerted among other county secretaries by Captain Holden, honorary secretary of the Nottingham County Club, and whom he was pleased to see present in the chair that night. Turning to the States, Daft said the reception met with there was quite as cordial as it had been in Canada, and that the players who opposed them were of better class. Though defeated they accepted defeat kindly and

honorably, and treated his men with the utmost liberality. Upwards of 30,000 assembled to witness the first Philadelphian match, and the sight presented by the company of ladies on the Grand Stands was beyond all description. The cricket all round was splendid; and as to the fielding, he never in all his experience saw finer. Daft concluded by proposing the health of "the American and Canadian teams," whom he and his men had opposed, and coupled with the toast the name of Captain George Newhall, of Philadelphia, who was especially kind to them during their sojourn there.—*Sporting Life*, (London.)

ARCHERY.

WHERE AND WHEN SHALL THE SECOND GRAND NATIONAL MEETING BE HELD?

ON the fourth Wednesday in January next the regular annual business meeting of the National Archery Association will be held at the office of Mr. Henry C. Carver, the corresponding secretary, at Chicago. It seems to be of much importance that this meeting should be attended by representatives from every society belonging to the Association. Besides the election of officers to serve for the ensuing year, and the election of an executive committee to manage the affairs of the Association, the representatives present will chose the time and place of holding the second grand annual meeting of the Association.

That it is of great importance that this meeting should be held under favorable surroundings no one will deny, but it is not easy to say just where the most favorable point for the meeting may be found. As to the time of holding it, there are many circumstances which make it seem desirable that this great meeting should occur in the month of June. At that season of the year, business men, who comprise the majority at every archery meeting, have as much leisure as at any other season of the year. The weather at that time is usually reliably fine. The archers are then at their best shooting form, not having yet become enervated by a long, hot summer. How true this last observation is, almost every archer attending the first national meeting last August can bear witness. Scarcely one out of twenty came there in good form. For many weeks preceding the meeting the average scoring of almost every archer had been very low, caused undoubtedly, in a great measure, by the nervous enervation from the long-continued heat. Either the meeting should be early in June or late in the fall; and there seem to be very many good reasons why it should not be held late in the season.

The English archers having had much experience in these matters, are almost unanimous in their desire for early meetings, and all bear witness to the greater success of those meetings which have occurred early in the season. In our own country the pleasure seekers who would usually attend our great archery meetings go to the seaside, the Northern lakes, and other resorts, for a "breathing spell" during the "heated term" of July and August, and a meeting at that time will never be so well attended. Another consideration which would weigh strongly with many, is, that if the meeting shall be held in June there will be several representatives of the skill of Great Britain upon the field. I have received letters from several gentlemen whose names stand high in archery circles in the Isles, who propose attending our next annual meeting, provided its date does not clash with their own Grand National in the latter part of July. How much such a visit would add to the interest of the occasion can readily be imagined, and many archers would come from great distances to be witnesses of the skill of our cousins from beyond the sea, who have upheld for so many years the honor of the bow. It would be worth, to any enthusiastic archer, a trip from San Francisco, to converse with a man who had shot over the same range with Ford, and Bramhall, and Maitland, and Moore, and Spottiswoode, and Holmes.

There are many other considerations in behalf of a June meeting, and since everything depends upon the work done at the January business meeting, it is very important that every society sends representatives to this meeting.

WILL H. THOMPSON.

STUD BEAGLE.—The English hare beagle Victor. Full pedigree; by imported Rattler, out of imported Blue Bell; is thirteen and a half inches high, weighs sixteen pounds; color, white, black and tan ticked. Stud fee, $10. Address N. ELMORE, Granby, Conn. Dec13,eot

FOREST AND STREAM KENNEL. Llewellin setter, Rattler, in the stud. Rattler is a handsome blue belton, black points, winner of four bench prizes; sire, Rob Roy, he by Laverack's Fred, out of Slatter's Phœbe, founder of the field trial strain, winner of five English field trials, out of pure Laverack imported bitch Pickie; she by Llewellin's Prince, winner of two firsts and three championships, out of Llewellin's Lill II.; no better blood in America. Will serve bitches at $15. Litters warranted. I am breeding to Rattler the following bitches:—Mell, a beautiful blue belton, black points, sire Jack, dam Spot, winner of first and second specials at Detroit, Mich., 1879, also first at Boston 1879 in native classes; Fly, a very fine roan belton bitch, sire Shot, dam imported Fannie; Pat, orange and white, out of Belle, by Royal George. Puppies bred from above, fine stock, for sale cheap. Address, with stamp, L. F. WHITEMAN Detroit, Mich. Dec11,tf

FOR SALE.—If taken before the 25th of December, I will sell the following valuable setters at a bargain: Imported red Irish prize bitch Floss, who has taken prizes at the following shows: Cork Show, Ireland; Centennial, Philadelphia; St. Louis, Mo.; Baltimore, twice; New York, and Philadelphia. She is a No. 1 brood bitch, and a very quick dog in the field; she will also be in heat in about three weeks' time; price, only $65. Nora, a great, lashing, strong bitch, red Irish, out of champion York and Thompson's Belle; price, only $35. A handsome Llewellin setter bitch, lemon and white; a beautiful bitch, and a pretty good worker in the field; price, only $50. One handsome black, white, and tan bitch pup, whelped on the 12th of May; a large, strong healthy pup, out of A. Burges' celebrated champion Field Trial and Bench Show winner Druid, and the Llewellin bitch Leda; price, $25. For pedigree and particulars, inqure of C. Z. MILEY, Lancaster, Pa. Dec.4,tf

25 FOX HOUNDS AND PUPS FOR sale or exchange for Sporting Implements. The finest bred and fastest in America. Every dog warranted. L. M. WOODEN, 119 Bowers Block, Rochester. Ju24 tf

FOR SALE——Red Irish Setter, with little white; three years old; good size and strong-built dog, and well feathered, and kind and easy to handle; put him in the field and he will attend to his part; you need not hunt the birds for him to stand; he will find them for you. He is fast, staunch as a rock; backs a dog on a point; great endurance; good nose as ever put on a dog's face; as good as any man's dog on quail; been hunted on woodcock, snipe and ruffed grouse. Lowest price, $40. Nov27 tf
H. B. VONDERSMITH, Lancaster, Pa.

FOR SALE.—Two Gordon setter bitch pups; full-blooded; perfect black and tan; six months old; good size, with pedigree on both sides. Also one Gordon setter dog, two years old; winner of first prize on the bench; perfect black and tan, and a perfect field dog; all broken, with a full pedigree; a rare chance for a good dog. Enquire of CHAS. T. BROWNELL, P.O. Box 350, New Bedford, Mass. Nov27

LAVERACK BLOOD FOR SALE.—Pups by the renowned sire of prize-winners, the pure Laverack setter dog Carlowitz; orange and white ticked, lemon Belton and chestnut Belton; dams of whelps from prize-winning stock; whelped July 3d and July 12th; price lower than the lowest. Also two whelps by Carlowitz, dam Princess Nellie, she by Pride of the Border, by Petrel. M. VON CULIN, Delaware City, Del. Oct9,tf

FOR SALE—Champion Berkley pups, red Irish setter pups, by Champion Berkley, out of Aura, she by Blarney, out of Eileen, both imported. Whelped June 29, 1879. ROBT. SAUTHOFF, Box 1, South Windham, Me. Sept 25-tf

IN THE STUD.—The pure Laverack dog Pride, by Pride of the Border x Petrel. The only pure Laverack in New England. Fee, $30. Address H. F. DEANE, Box 1,612, Boston, Mass. Sept. 4—t. f.

The Kennel.

ASA L. SHERWOOD.

Skaneateles, N. Y.

GORDON ENGLISH, AND FIELD TRIAL SETTERS
OF PUREST STRAINS.

THE FOLLOWING PRICES will show I mean sell out:—

Victress, pure Laverack, full sister to the Great Countess, one of the best bitches that ever lived. She is by Old Blue Dash II, and Moll III. Victress won two prizes—Manchester, H. C., Birmingham. To parties in want of a pure Laverack to breed this is a rare chance. Price $75, not one-half what she cost; was sold at public outcry in England for $200.

Irish setter Gipsey, red, and some white; hunted some on quail; very obedient and easy to handle; sire of Gipsy, Rodman's Dash, who was the best Irish setter on game in the United States. She is a good brood bitch, and just served by my red Irish setter King Bee, who was sired by champion York; a perfect beauty, and if she fails to pup will serve her free next time, but she never missed. Price only $35.

France, a field trial bitch; a beautiful head; ears hung low; a good brood bitch; never hunted her; bought her in June; will guarantee her to stand a pigeon in yard for twenty minutes, and from her movements I think would be good in field. Price $25. Litter of pups worth four times that amount.

Llewellin setter bitch one year old, blue ticked; raised and bred by L. H. Smith, of Strathroy, Ontario, Canada; sire, Paris, and dam, the pure Laverack bitch Peeress; Peeress and Paris are both broken, and Paris is one of the best field dogs in this country, that money cannot buy; the Chicago *Field* of Nov. 8th, '79, gives a cut of the famous Paris and his field winnings and on the bench; parties buying will get pedigree and his winnings printed. Price only $50. These are bottom prices.

Address H. B. VONDERSMITH, Lancaster, Pa. Nov. 27-tf

IN THE STUD.

"RED GROUSE,"

IMPORTED IRISH SETTER.

Setters and Pointers thoroughly Field Broken.

Young Dogs handled with skill and judgment.

Dogs have daily access to salt water.

N. B.—Setter and Pointer puppies; also, broken dogs for sale; full pedigrees. Address H. C. GLOVER, Toms River, N. J

PINE LODGE KENNELS.—I am prepared to take a limited number of dogs, either setters or pointers, and train them thoroughly. I give my puppies seven months' work out of the twelve, and guarantee satisfaction, if the dog has all the natural instincts. References on application. Prices, $50 and $75, according to length of time I keep the dog, with discount to parties at long distances. A. WINTER, Cairo, Thomas County, Georgia. Oct 2,tf.

IN STUD—The two white imported Bull Terriers, Teddie and Viper; weight, twelve and twenty pounds; also English bulldog, Crib; weight, forty-two pounds. For particulars address "CRIB," 23 Myrtle street, Boston. Orders taken for thoroughbred bull pups from the above Crib and imported Judy, to be whelped Nov. 28th. Portrait of Judy can be seen at this office. Nov20,1mo

LINCOLN & HELLYAR, Warren, Mass., can furnish a few highly-bred sporting puppies. Sep.18—tf.

The Kennel.

Neversink Lodge Kennels.

The following celebrated Dogs are for sale.

DOGS:

St Bernard dog "Marco"; rough coated, two years old; a magnificent animal—Rev. J. Cumming Macdona's stock—second prizes Hanover Show and Rochester.

New Foundland dog "Keeper"; four years old; first prize Westminster Kennel Show, 1879.

Pointer dog, "Croxteth," liver and white; one and a half year old; out of Lord Sefton's renowned stock—one of the handsomest pointers in the United States. Second prize in the Hanover International Show. Broken.

Blue Belton setter, "Decimal Dash," eighteen months old; sired by Llewellyn's celebrated "Dash"—a magnificent stud dog—never exhibited.

Irish setter, "Rover II"; pure red; sire of Macdona's champion "Rover." Never exhibited; thoroughly broken.

English setter, "Ranger II"; a pure bred Laverack, son of Macdona's celebrated "Ranger" His get won first at Hanover and Paris shows.

English setter "Ranger Rival," a half brother to Ranger II., never exhibited.

Any of these dogs will serve approved bitches at $25.00.

Bitches.

St. Bernard "Braunfels," rough coated, out of Prince Solm's celebrated stock; a magnificent bitch, in whelp to "Marco," 1st prizes in Hanover and Rochester show.

Pointer "Queen," liver and white. 1st Westminster Kennel Show 1878, in whelp to champion "Sensation."

Gordon setter "Beauty," 1st Boston Show 1878, 2nd New York Show 1878.

Pointer "Dora"—liver and white, out of "Queen" and "Sancho," in whelp to Croxteth.

Blue Belton setter "Silk," in whelp to Ranger I.

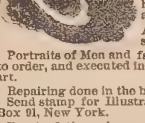
Irish Setter "Moya," out of Col. Hilliard's "Palmerston;" will be red to Rover.

English Setter "Donna," white and lemon, in whelp to Ranger II.

Pups out of all the above first-class bitches can be secured by an early application. Besides I offer for sale pointers, setters of minor quality, but of good thoroughbred stock; full pedigrees. Particulars will be furnished on application to

A. E. GODEFROY
Guymard, Orange Co., N. Y.

WITHOUT RESERVE.—Owing to a change in locality and re-organization of the kennel, all the setters, four pointer bitches, all broken; and four pointer pups by champion Sicaford, must be sold by Jan. 1st. The setters are of the finest Llewellin breed. For pedigree and price address at once, W. T. IRWIN. Dec1-2t Topeka, Kansas.



A RARE CHANCE.—Whelps for sale, out of champion Fire Fly, by champion Elcho. Also, white out of Belle ("Pride of the Border"—Kirby), by Carlowitz. Address H. W. GAUSE, Wilmington, Del. Oct. 9, 1mo.

WILL EXCHANGE.—My setter dog Tip, well broken and staunch, on either quail or grouse, and splendid retriever; two years old; black and white; for double barrel gun or first class rifle. Address W. H. WHEELER, Dec1-3t Millbury, Mass

"THE FISHING LINE."

TAKE THE

Grand Rapids & Indiana R.R.

Mackinaw, Grand Rapids and Cincinnati Short Line

FOR THE

Trout, Grayling, and Black Bass Fisheries,

AND THE

FAMOUR SUMMER RESORTS AND LAKES

OF

NORTHERN MICHIGAN.

The waters of the

Grand Traverse Region

and the Michigan North Woods are unsurpassed, if equaled, in the abundance and great variety of fish contained.

BROOK TROUT abound in the streams, and the famous AMERICAN GRAYLING is found only in those waters.

The TROUT season begins May 1 and ends Sept. 1.

The GRAYLING Season opens June 1 and ends Nov. 1.

BLACK BASS, PIKE, PICKEREL and MUSCALONGE, also abound in large numbers in the many lakes and inlets of this territory.

The sportsman can readily send trophies of his skill to his friends or "club" at home, as ice for packing fish can be had at many points.

TAKE YOUR FAMILY WITH YOU. The scenery of the North Woods and lakes is very beautiful; the air is pure, dry and bracing. The climate is peculiarly beneficial to those suffering with

Hay Fever and Asthma Affections.

The hotel accommodations are good, far surpassing the average in countries new enough to afford the finest of fishing.

During the season Round Trip Excursion Tickets will be sold at low rates, and attractive train facilities offered to Tourists and Sportsmen.

Dogs, Guns and Fishing Tackle Carried Free at owner's risk.

THE END.

THE course of the weariest river
Ends in the great grey sea;
The acorn forever and ever
Strives upward to the tree.
The rainbow the sky adorning
Shines promise through the storm;
The glimmer of coming morning
Through midnight gloom will form.
By time all knots are riven,
Complex although they be,
And peace will at last be given,
Dear, both to you and me.

Then, tho' the path may be dreary,
Look onward to the goal;
Though the heart and the head be weary,
Let Faith inspire the soul.
Seek the right, though the wrong be tempting,
Speak truth at any cost,
Vain is all weak exempting
When once the gem is lost.
Let strong hand and keen eye be ready
For plain and ambushed foes;
Thought earnest and fancy steady
Bear best unto the close.

The heavy clouds may be raining,
But with evening comes the light;
Through the dark are low winds complaining,
Yet the sunrise gilds the hight,
And love has his hidden treasure
For the patient and the pure;
And time gives his fullest measure
To the workers who endure;
And the word no law has shaken
Has the future pledge supplied;
For we know that when we "awaken"
We shall be "satisfied."

—*Tinsley's Magazine.*

Nepigon River and Lake.

NUMBER III.

THE first view of Lake Nepigon opened suddenly before us. The portage trail had led us over bare granite rocks, with few trees to relieve the monotonous scenery after leaving Big Sturgeon Lake, gradually rising higher and higher until we reached the summit within two hundred yards of Nepigon waters. The rocks over which we had travelled had been rounded and polished ages ago by the vast Northern glacier pushing its way over all obstructions, or by the swell of that universal sea, above whose surface the heights of this region were among the first to rise. We stood upon what some geologists say is the oldest land in the world. But the first view of the lake drove geological reflections from our minds. The great smooth rounded rock upon which we stood, descended so steeply to the water's edge that we felt the need of the sure "shoe packs" used by the men in carrying their loads—for the surface, where not roughened by lichens, was so polished as to afford only precarious footing. Down by the water the seas dashed wildly up the rock, for the wind which had blown heavily on Big Sturgeon Lake, came all the fiercer over the broad expanse of Nepigon. Down to the left extended a deep bay, and to the front and right were green islands, seemingly beyond number: an occasional high peak, or bluff, showing above its neighbors. We knew by the force of the seas that they came from some great body of water, yet to the eye the lake seemed everywhere bounded by not distant shores.

Right around us a few low bushes upon which the blueberry was just ripening, and occasionally some taller shrub found root, where, in crevices of the rock, a little moss made soil had accumulated; while over to the North a hundred yards, upon a higher rock, a few stunted pines struggled for existence. Down to the left some balsam and spruce could be seen, where a depression in the surface had received for ages the wash from the higher surrounding rocks. But the islands of the lake bore a fresher promise, and looked green and beautiful in the distance.

We camped upon the rock, securing our tent with what few loose stones we could find, and there we stayed until four the next afternoon, wind bound. There was little animal life to be seen, the wind keeping off even the pestiferous black fly, for the most part. A few pigeons after the blue berries, and one or two cedar birds we saw among the dwarfed pines, but nothing else. The wind was too heavy to cast a fly, and a few throws of the spoon along the rocks yielded nothing but exercise. So that it was with pleasure we saw the wind going down and the sea quieting, until we could launch and load our canoes—a difficult thing to do between the waves and the slippery rocks. But we finally pushed off, intending to make an island some seven or eight miles to the north, to camp for the night. Wassy had been over this route and knew every island and rock. The brigades usually go another way, a few miles shorter, but by that there is a "crossing," or "traverse" of some fourteen or fifteen miles, which even the big brigade canoes with their eight or ten paddlers, dread to take. As we went, the longest traverse is about seven miles, as we estimated it.

Some two or three miles before reaching the first island on our line of travel, numbers of gulls came flying out to meet us, as they always do when boats approach their nesting places. They flew circling and screaming over us as if inspecting our force and trying to frighten us away, and then returned as if to report, while others as we neared their island, came, inspected, screamed, and returned like the first. Upon a near view of the island it looked impracticable for a camp, so we did not touch there, but stopped for a few minutes' rest at a rocky islet two or three hundred yards distant. A few wrens, and two young gulls that paddled off in frightened haste as we climbed upon the rocks, were the only signs of life there, excepting clouds of gnats that danced in the evening sunshine. The gulls, which had circled and screamed over us on our approach, flew off to the near island, which was densely covered with tall spruces, and to our great surprise lighted upon the tops and branches of the trees. The Indians and voyageurs were even more astonished than we, to judge by the volume of Chippewa language which broke from their lips. They, as well as ourselves, had never seen such a sight. The white forms of the gulls against the dark green of the trees made a rich contrast, which it seemed could not be mistaken; but we felt inclined to doubt even the evidence of our senses, and sent a bullet from our rifle through the trees, which startled up the birds, and we saw them fly off and over us, and finally settle back again upon their strange resting places. When we left the islet the gulls flew off after us, watching and screaming for a mile or two, until they felt sure, no doubt, that they had driven us away.

We camped upon an island some fifteen miles almost due north from the portage. In the manner of canoe Indian travel, we took a daylight start the next morning and made seven miles before breakfast. I believe this was the only morning of our trip that we begun the day's journey in this way. We did not care to repeat it. In the early morning we caught sight of some otters at play between the island, but were not near enough to frighten them. At Wassy's instance we took out our spoons at what he said was a famous lake trout resort, and in ten minutes we secured three fine ones, which served for breakfast and a substantial chowder dinner later in the day.

All the islands, so far, in the lake were piles of broken rocks, which looked as if dropped there in disorder. No ledges were apparent. Some of the islands were rimmed with irregular piles of stone, looking at a distance like the old-fashioned New England farm wall, with sides as steep, but higher. It was not until 10 o'clock that morning that we came to an island at the southern end of the traverse I have mentioned, which had solid masses of rock at the edge of the water, extending up in places fifty or sixty feet in height, and topped by irregular and jagged stones of all shapes and sizes, moss-grown and tree-crowned.

We landed here for a few minutes' rest in the cool shade of rocks and bushes at the water's edge, for we had a fierce sun and not a breath of air rippled the surface. As R. expressed it, "there wasn't even a gooseplimple on the lake." Away off to the northeast, between distant islands, sky and water seemed to join; while to the southwest the eye ranged down into the recesses of Chief's Bay, finding no land upon which to rest. Further to the south the high steep bluff, where the brigades leave the shelter of land with their freighted canoes for Nepigon House, was purple in the distance; while almost directly to the west the bold island height, the first land made by the Indians in that long and hazardous traverse on their upward trips, showed its outline distinctly against the sky. When this point is made the Indians rest for a while from their work, take their much-prized tea, and rejoice over their one more safe passage.

With our small canoes, the seven miles before us looked long. The Indians who had made it, and the voyagers whose experience with them told them the danger of a sudden storm in the mid-passage, scanned the lake and sky for signs of change. While they are remarkable observers of many things, my experience justifies me in saying they are not good weather prophets. A sign of human presence n a forest, a twig broken by game, a canoe upon the water t such a distance our eyes can seenothing, the habits of nimals they capture—they have keen sight and observation for. But as to the weather, even in their own country, they seem to oftener fail in judgment than the average white man. So when one looked anxiously to the east and noted and feared the misty low lying purple of the distant land, and the haziness in which the line between the sea and sky was lost, and shrugged his shoulders at the prospect, and another thought he saw signs of wind in the western sky among the fleecy clouds there making their appearance, there was nothing, we knew, to be gathered from their judgment; and relying upon our own, aided by our trusty aneroid barometer which since early morning showed a barely visible low ering, we pushed off. The men once started, set to their work with a vigor born of dread rather than zeal. When mid-way they rested a moment and lighted their pipes, while I took advantage of the stop to test the temperature of the water. There were no signs of shoals, and the clear sunlight shining into the deep water enabled us to see to a considerable depth. To our surprise 57 deg. was the lowest point reached. I had tested Nepigon River at various places, and found it uniformly 54 deg.: and in this connection it may be as well to state that upon tests made eighteen days later, I found the river everywhere 59 deg. But at no other place in the lake besides this "crossing," away from the influence of warm rivers (hereafter to be mentioned) and shallow bays, did I find the temperature above 54 deg. I have no theory to explain the differences observed. (Lake Superior from Nepigon Bay, down to Cape Gargantua I found to be 53 deg., with occasional showing in some localities of 54 deg. Michipicoten River was 60 deg. These observations were made on my homeward coasting trip from Red Rock to Sault Ste Marie).

The canoe grating on the rocks at the end of the traverse awoke me from a nap I had indulged in the latter half of the way, and I found we had been an hour and three quarters making the passage. After a short rest, we sought a cool and shady place for dinner, and that over we started out, hoping to make Nepigon House that night. Our course in the afternoon lay between lovely islands, upon one of which, at the first sand beach we had touched since leaving Red Rock we stopped for a few minutes. It was one of the largest of the islands of the lake. A cool brook came down into the sand from the high ground in the interior, and the character of the vegetation showed evidences of a real soil such as we had not hitherto met with in the lake islands. Tracks of rabbits and bear showed the existence of game, but the undergrowth was too dense for summer hunting. The island rose gradually to the height of several hundred feet above the water, and for many days in our voyage it could be seen and recognized.

A breeze springing up from the southeast helped us somewhat, but about the middle of the afternoon it suddenly shifted to the south and became too fresh for comfort, so we rounded a rocky point over which the waves began to dash savagely, and took shelter in a little bay with an outlook to the west over a traverse of four or four and a half miles to the next sheltering islands. The water had become white with the gale, and the sea, with its unbroken sweep of twenty miles from the windward, grew every moment heavier and heavier. Content with our safe harbor from the storm, we settled down as gracefully as possible into camp, and to kill time tried our flies about the neighboring rocks, but without success.

It was afternoon of the next day before the wind and sea abated sufficiently to warrant a start, and to ensure greater safety the load of the smaller canoe was lightened by the exchange of places between R. and F. and myself. Even with this, however, some water was shipped, and my coat upon a cushion of balsam boughs became rather damp before we got over. As we pulled out of the little bay the scene presented was most enchanting. The islands had grown more beautiful as we had come further to the north—the trees larger and vegetation generally ranker and more advanced. But now off to the north, apparently four or five miles away, uprose from the water a huge bare cliff, with purple sides, sheer into the air hundreds of feet. Off to the northwest towered another bare rock, even higher, apparently four or five miles inland from what we thought the shore of the lake. The tops of these two mountains, for such they appeared to be, were flat, and at the distance seemed without vegetation. Behind us were the islands we had passed, and all along the western coast of the lake were other islands so overlapping each other that we supposed them to be the mainland. An occasional white cap gave animation to the scene, and far off the smoke of an Indian encampment showed blue against the verdured hills.

The crossing made, we stopped upon an intervening island for a short rest, and plucked blueberries and strawberries, the latter showing ripe fruit and blossom at the same time. With a short pull from this place we rounded the point of an island, and a mile or so away we saw the flagstaff and white buildings of Nepigon House.

Scattered about upon the islands and the main shore were bark wigwams, and close by them, just at the water's edge, were numerous canoes, not a few of which started off to meet us at the little dock as soon as the sharp-sighted Indians discovered we were white and

strangers. When we landed at the dock we were met by Mr. Henri Le Ronde, the Hudson's Bay Company's agent here, whom in the two days of our stop at the port, we found to be a most estimable and intelligent gentleman. Some of the Indians recognized Wassy and Wabagabo, and the "Bon jours" flew thick and fast. Mr. Le Ronde gave us a fine camping-place within the Company's enclosure, but our warmest welcome was from the black fly, which was abundant and active. We were soon in camp, settled down for Sunday. Some fish were procured from the Indians, and we made ourselves comfortable, as only old campaigners know how to do.

But what we learned about trout and other things will be told in another paper.

GOOSE-HUNTING IN VIRGINIA.

WE had made up our minds that we would kill those geese, and provided ourselves accordingly. Gudgeon, not content with one gun, took two, with shot and powder enough for twenty. The Doctor carried a tremendous swan gun, as tall as himself—a gun that quietly knocked him down ten times or more during a day's hunt. His ammunition was in proportion. Spurr had an old muzzle-loader of mighty bore and a mighty "kicker," with the admirable quality of getting its ramrod hopelessly hung whenever Spurr labored under excitement. "But when she did go off" Spurr would say, "She knocked 'em!" It was always difficult to understand whether he referred to the hunter or the game. He loaded the gun five fingers on the ramrod, and used half a newspaper for wadding. It would be superflous to mention the number of times Spurr put the shot into the gun first, and the energetic language he used, when he snapped off fifty caps to get the thing to do its duty. When squirrel-hunting, Spurr had a miserable habit of fancying that he saw a squirrel in every other tree we passed, and would bang away for an hour to satisfy his curiosity and enthusiasm.

I closed up the rear of this interesting goose excursion with a light sporting gun and an extremely heavy and awkward apparatus, which he chose to call a reflector. Our combined efforts and knowledge of what a ducking reflector was like had been brought into play, and the result was a square three-pound canned-good's box, lined with heavy tin, two sorry-looking candles, and a broken pane of window glass at the opening in front, "to keep out the air," said Spurr. Our experiments in the barn were not as satisfactory as they might have been, and the only fact disclosed at the trial was, that the thing was heavy. We trusted that in open air, aroused to greater efforts through the excitement of the hunt, it would "reflect" credit upon itself. My ammunition was in proportion to the lavishness displayed by my fellow huntsmen.

And so were we four loaded down as we stepped into the wherry, at 6 o'clock on Monday evening, that was to convey us to the happy goose-grounds on the other side of the river.

Our start was inauspicious from the fact that the reflector fell overboard in my clumsy attempt to enter the boat. Ten minutes were lost in fishing it out again, and another ten minutes in running up to the store for fresh candles. Then the Doctor's Panama blew into the river, and, strange to say, sank. As this happened when we were some distance from the wharf, Spurr simply said:—

"Why, hang it, Doctor, tie a handkerchief around your head and brave it out. We can't lose any more time now, in getting a hat."

The Doctor did so. He was a mild man, and invariably swallowed any sensible suggestion.

We had rowed perhaps a mile or more, when Gudgeon, greatly excited, rose from his seat and yelled, that "there was a wild duck right under our bow." We didn't mention that the yell might frighten the bird off, but we looked it. Of course, the duck disappeared, and a moment later came to the surface some thirty yards to the rear of the boat. Gudgeon was already at an aim, and, when we shouted, "There she is! Blaze away, old boy!" he murmured a maudlin "Where?" and fortunately, catching sight of the duck, banged away with a recklessness of manner that aroused our earnest sympathy for him. He had only broken a wing of the "black neck." In an instant we were all as excited as Gudgeon, and stood up to a man, with our guns cocked, awaiting the reappearance of the duck. It came up some ten feet off, and, with a roar that would have rivalled United States' artillery, we poured about a pound of shot at the poor creature. It dove in time, however, to escape the hail, and appeared again at an oar's length from us. Spurr, being the nearest to the duck, bawled for an oar. We provided him with one simultaneously. Giving a mighty grunt, he threw it recklessly at the wounded bird. Dear reader, shall I say that he missed it? Out of pure respect to the memory of Gudgeon, I shall remain silent. I will say, however, that Gudgeon tried it again. Spurr tried it, and nearly went overboard in so doing. I tried it. The sauve Doctor tried it. Our darkie rowing the boat tried it. Spurr's excitement was at so high a pitch, that I verily believe he would have thrown his gun at the duck, had we not restrained him. He proposed to send the reflector at it, but I sat down indignantly on the thing and said "No!" (To say the truth, the reflector was mainly a pet idea of mine, made under protest; but on my agreeing to carry it, the rest consented that we should take it with us.)

How long the yelling and frantic splashing would have continued I can't say, had not our darkie suggested that we should "Shoot him, Massa!" Fools we! And we did; and when Spurr calmly picked the creature out of the water, we all wore such hypocritical smiles that the glory of the killing departed at once.

The rest of the row was made in silence.

The other side of the river reached, we looked about anxiously for the conveyance that was to have taken us to the goose-haunts, which, we were told by the natives, was some eight miles up the road. We looked high and low, with a flock of grinning darkies at our heels, but not a vestige of the wagon was to be seen. Here was a predicament surely. Eight miles before us; our tremendous load of guns and ammunition to carry, and approaching night, were things that did not sound funny when taken into consideration. There was no alternative left, however, but to foot it. Paying our boatman, we started up the road, with but vague directions of the whereabouts of our stopping point. The Doctor was mad; Gudgeon was mad; Spurr was mad; and I was mad. Our conversation was not lively, as we trudged up the road in sand up to our ankles. The Doctor seemed to think that it was all our fault that the wagon had been missed, and forged ahead with tremendous strides, which developed a gait on our part that was severely trying. It was not long before we came to a fork in the road, and to solve the question, as to which branch we should follow, we solemnly drew lots, and rushed into the one fate had ordained us to take. We were utterly at sea now, and had not the slightest idea of where the road was leading us to.

Spurr timidly suggested that it would have been better if we had not come at all. Miserable wretch! And that was all the sympathy we got.

I shall not weary you with the details of that distressing walk. It might be summed up in three words: Sand, perspiration and silence. But our enthusiasm had not entirely left us. The spark burned sufficiently long to carry us to the happy hunting-ground, for very fortunately we were on the road that led to it.

We found a fine old farm-house, a genial host, and a good supper awaiting us. The supper despatched, our fellow-feeling had so far returned that we suggested a goose-hunt right then and there. The night was dark, no wind was blowing, and what was better, the farmer assured us that just before sunset he had seen a fine flock of geese settle in the swamp below.

"Where can we get a boat?" suggested Spurr.

"Down at the creek—Jake's boat. Pretty small, but I guess it will hold you all," said the farmer.

We were now at the highest pitch of the "goose" craze, and started away for the creek with our full complement of guns, ammunition and reflector.

For the first time since the organization of our hunt the Doctor, Spurr and Gudgeon looked favorably upon my reflector. Spurr even offered to carry it for me, but I would not trust him with it, for too much depended on the apparatus to be ruined by any recklessness. To our dismay, when we reached the creek leading to the swamp we found the boat chained and locked to a sapling cedar. We were very charitable in our expressions about the farmer for the space of a minute, and the mild Doctor even went so far as to say that he would punch that gentleman's head without pecuniary consideration, and in the darkness we saw his eyes flash indignantly.

I lit the reflector to get a better view of the boat and our surroundings. There stood the tall, slim cedar, towering in a dignified way into the blackness above, with the chain lying cozily at its foot. The boat also lay very quietly, and we stood about it as quietly, thinking intensely. Finally Spurr drew a huge jack-knife from his pocket, and grasping the tree commenced to whittle. We laughed grimly. We had not long to wait, for the sapling fell slowly and gracefully, under the combined influence of our pulling weight. The boat was ours, and we were happy again—for the time being.

The boat was originally intended to carry two, at least it appeared so; but as no two of us were magnanimous enough to stay at home while the other two sallied forth after geese, the result was that the boat must carry us all. I should take the bow, with a paddle and the reflector, the Doctor was to shoot over my head, Spurr was to rake to the right, and Gudgeon rake to the left. The theory was excellent, and we proceeded to carry it into effect.

The Doctor volunteered to try the boat first, to see if it leaked or not, for we would rely no further on the diabolical farmer.

"Have you got the paddle?"

"Yes, in the bottom of the boat," says the Doctor.

"Get in;" and in got the Doctor, while we three seized the boat and with a tremendous effort pushed it far out into the creek. The Doctor recklessly stood up before the boat had lost headway, and a dismal splash finished the tragedy. Again we laughed in grim chorus. We continued to laugh as the Doctor waded ashore, chattering and muttering fiercely. Before we could stop our laughter the Doctor had picked up that big swan-gun, and giving a mighty grunt as he lifted it, he hissed that *he* was going off after squirrels!

"Are you mad?" yelled Gudgeon.

"Are you insane?" yelled Spurr.

"Are you an idiot?" yelled I.

"How are you going to shoot 'em in the dark?" we all yelled at once.

The Doctor paused in his "fierce career," and turning said very mildly for one in his condition of mind: "I suppose those geese out in the swamp are used to yelling?" And turning again he walked away with long and manly strides.

Secretly we exulted at this unexpected turn in our affairs, for now we were only three to patronize the boat, and a positive fate through drowning was to be avoided. But we took good care not to impart such selfish exultations to each other. It might have resulted in an indignant row. Meanwhile the boat lay very peaceably on the water, without the slightest intention of budging an inch towards our eager, outstretched hands. Spurr tried to whistle for it, but a combined whistle and smile is a physical impossibility. Gudgeon proposed to sink the abominable thing by hurling heavy stones at it. But then Gudgeon was mad and shivering audibly, with his enthusiasm fast dying out. The night was growing bitterly cold; a sharp wind was setting in from the north, and our patience was losing ground. Finally Spurr, with admirable recklessness, rushed into the water, seized the boat, dragged it ashore, tossed his duds into it, got in himself, all in the twinkling of an eye, and grasping the paddle said that "he was ready!" So were we, as soon as we had recovered our balance, amazed as we were at the fearful enthusiasm of Spurr.

By holding our breath at frequent intervals we managed to keep the boat afloat. But as this operation grew tedious, Spurr proposed that he would get off on one of the numerous clumps of grass in the marsh wherever a firm footing could be found, and shoot into the air as the geese passed over him. He smiled in a very sickly manner when he made this proposition. He didn't give us time, however, to ask how he was to hit them in the dark, but made a landing on a small islet that we had just reached very summarily.

Gudgeon and I were alone in the boat, secretly exulting again. We paddled very quietly down the creek for a quarter of a mile or so, my reflector shedding a beautiful light on the water ahead. There was no doubt of its being a success. We watched expectantly and breathlessly for it to illuminate a flock of geese. Finally, as we rounded a bend in the creek, we saw, on a broad expanse of water before us, a magnificent flock lying motionless. They did not remain so long. At the very instant we rounded the bend, and my reflector brought to view the geese, a tremendous report rang out from some bushes at the side of the creek nearest us. Before the smoke cleared away the geese had disappeared, with a vast amount of noise, into the darkness above.

A low laugh came from the bush, and throwing the rays of my reflector on the spot, whom should we see but the tall Doctor looming up in ghostly majesty, quietly loading that big swan gun.

"Come ashore," he sang out, "and let me gather in the two I've killed; and, remember, never laugh at me again." And we didn't.

The reflector and I parted company then and there, with a pious benediction on my part, as the waves closed over it. We took the Doctor and his two dead geese aboard; paddled silently back for Spurr; landed the boat; walked moodily home, the Doctor chuckling occasionally, in which we did not join; slept poorly, and trotted on home the next day, sworn friends.

W. H. WINSLOW.

Fish Culture.

THE DUTCHESS COUNTY SYSTEM.

THE Board of Supervisors of Dutchess County, this State, have taken commendable interest in supplying the waters of the county with food fish. They appear to have been alive to the importance of pisciculture and to have adopted a very satisfactory plan of work in this direction. The restocking of the streams has been placed in the hands of a judiciously selected committee, which consists of the following gentlemen: J. S. Van Cleef, chairman; P. A. M. Van Wyck, Peter H. Christie, Albert Emans, David Warner, James H. Weeks. During the year 1879 the distributions of brook trout fry has aggregated 80,500; of land-locked salmon, 10,000, and of black bass spawners, 126. The annual report of the committee we publish below. It is an argument for the localization of fish culture, the supplementing of the State Fish Commissioners' efforts by individual town and county organizations. This is the tendency of the more advanced sections of the country in fish culture and game protection. The report reads as follows:—

To the Hon. the Board of supervisors of the County of Dutchess:

GENTLEMEN—The Fish Committee of this county appointed by you last year, respectfully render the following report of their proceedings for the current year:—

Early in the year diligent effort was made to ascertain what waters in the county still needed to be stocked with fish, and the desired species. The result was not very satisfactory.

It was hoped that by this time sufficent information would have been furnished to enable us to prepare and submit a statement showing the location and size of the principal streams and ponds in the county, the character of the water, and to what extent and with what varieties they abound in fish.

It seems impossible to obtain such information in response to requests through the public press; and yet the necessity for it is too obvious to need any detailed explanation.

The funds appropriated by the Supervisors should be so expended that every town will be benefitted in proportion to its needs, but in the absence of proper information, your commitee can do little else than distribute such fish as they may get to those who take the trouble to call for them. To illustrate; Black bass were introduced into Sylvan Lake many years ago.—From that lake they have emigrated into all the waters connected with it especially Fishkill and Sprout Creeks; and the destruction of some varieties which used to abound in these streams, notably the pike, has been almost complete.

Now the ordinary whin-fish, frequently called chub, will thrive alongside of the bass, and it will take the fly almost as freely as a trout; and it might prove a decided benefit to these streams if information were given showing to what extent the whin-fish which used to abound there have survived the attacks of the pike which was the predecessor of the bass; and also whether this fish abounds in any other waters in this county now stocked with bass.

Last year we were supplied with 10,000 land locked salmon. The want of proper information prevented an extended distribution of these fish.

From all the information that could be obtained your committee were of the opinion that it was desirable to procure brook trout almost exclusively last year. A few black bass were furnished by the State Commision without solicitation and they were gladly accepted and were principally used in stocking waters which were already partially stocked with bass.

It was the intention to so appropriate the funds in our hands that a balance would be left over for use in case of demand for assistance in prosecutions for violations of the law, but after the appropriation had been made, notice was received from Hon. Spencer F. Baird, United States Commissioner of Fisheries, that we could be supplied with 10,000 land locked salmon spawn to be hatched at our expense; and still later we received a telegram from Mr. Seth Green stating that he had sent a messenger with 25,000 more of the small fry of brook trout.

We deemed it unwise to reject these gratuitous supplies, even though we had to advance the necessary funds for their reception and distribution.

The additional expense caused by this action was over $100, and creates a deficiency of $71.68, as will appear by the statement of expenses which is hereto annexed.

At the request of the other members of the committee the chairman went to Albany last spring to meet the Assembly Committee on Game and Fish; and as a result of that conferrence the general law was so amended that the provision then existing excepting Wappingers

Creek from the prohibition against fishing with nets, was stricken out, and the law made uniform as to this county.

At his suggestion the section giving the right of local legislation was also amended so as to read as follows:

Section 37. "It shall be lawful for the board of supervisors of any county at their annual meeting, to make any regulations or ordinance protecting other birds, fish or game, than those mentioned in this act; and also for the further protection of such birds, fish or game as are in this act mentioned, except wild deer, and to this end to prohibit hunting or fishing in particular localities or waters lying wholly within their respective counties for limited periods and during certain months of the year, and to prescribe punishments and penalties for the violation thereof, and adopt all necessary measures for the enforcement of such punishment and the collection of such penalties and such regulations and ordinances shall be published in the papers in such county in which the session laws are published and a certified copy thereof shall be filed in the office of the clerk of the county."

The powers conferred by this section are still indefinate, but it was impracticable to obtain any more complete amendment. As the law now stands even as amended, the powers vested in Boards of Supervisors are possibly more limited than is generally supposed.

The constitution authorizes the Legislature to delegate certain powers to Boards of Supervisors, but it cannot confer a power it does not possess itself.

The right of the Legislature to pass game and fish laws arises only from the power to control or regulate the manner in which a right or privilege belonging to two or more in common shall be enjoyed by all possessing this common right.

To illustrate: If a person has a pond exclusively on his own land with neither inlet nor outlet, the fish, being in a state of captivity, are the exclusive property of the owner of the land, and the owner can probably take them when and as he likes.

But when two or more own land underlying a pond or stream, the Legislature has the right to pass a law for the protection of the fish which are common to the water therein, and such a law is made for exclusive protection to the owners of the adjacent or underlying land, not only against outsiders but as against each other.

Suppose that four persons, each own one quarter of the land underlying a pond having no inlet nor outlet, it is questionable whether the Legislature have the power to draw an imaginary line through the centre of such pond and, under the pretense of protecting the fish which roam through the entire waters, or by virture of their power to regulate the manner in which these four persons shall enjoy a right or privilege common to all; then say to the persons on one side of such line that it shall be unlawful to take fish in any way for a period of years, and at the same time permit those on the other side to take them when and as they choose. And yet w different laws are passed for different counties this result must often follow.

And if it is not clear that the Legislature has such power, then it is equally uncertain whether Boards of Supervisors can be empowered to pass any ordinance regulating the taking of fish in their own county in waters which in part lie in or flow through an adjacent county.

The question must sooner or later come before and be settled by the courts, whether local acts for the protection of fish must not be made to apply to the entire waters of a stream or pond or lake, instead of being limited by arbitrary geographical lines.

Your Committee therefore respectfully submit whether it would not be well for this Board, in view of the large interests involved, to take immediate steps tewards securing the passage of such general laws as shall more clearly define the powers of Boards of Supervisors in regard to local legislation, especially in regard to waters lying partly in their own and partly in other counties.

At the present time the local laws passed by this and other boards are not only not respected, but their enforcement is very generally defied, and your Committee recommend that any ordinance for such further protection of fish which may be passed in accordance with the powers conferred by the above section should for the present be made to apply only to waters lying wholly within the boundaries of the county.

The belief that the ordinances heretofore passed, cannot be enforced has led to an open defiance of the law in this county, and has, it is believed, done much towards creating an indifference to protecting our waters.

Your committee are of the opinion that it is desirable to procure as soon as practicable, a supply of the Michigan grayling and of foreign carp, and although they are not advised that these fish can be procured during the coming year, yet in suggesting a further appropriation, the possibility of obtaining these fish is had in view.

Your committee have been impressed with the fact that for want of definite information as to the waters of this county, and the varieties of fish therein, they have been unable to apportion the fish received by them, equitably among the different towns.

Instead of delivering fish simply to those who may apply for them, they are of the opinion that in order to carry out fully the purpose for which they were appointed, they should be able to stock the waters generally with desired varieties of fish so far as any appropriations coming into their hands will permit—such action must be preceded by the definite information which, as stated above, they have solicited but have failed to obtain.

They therefore suggest for the consideration of the Board whether it may not tend to a more just as well as economical use of any further appropriations which may be made, for them to give some Committee of the Board the power to obtain such information; and to that end, to authorize some person to make a personal inspection of, or to inquire into the character and location of the principal streams and ponds in this county, and the varieties of fish now therein.

Such information could probably be obtained and collated at an expense of not exceeding $50 or $75, as no doubt some persons interested in the matter would volunteer to do the work if only his actual expenses should be paid.

In distributing fish during the last two years it has been necessary to notify parties who have called for them, that they would have to bear the expenses incurred in calling for them at the place of delivery and depositing them in the streams.

This has entailed upon persons who were quite willing to give their time and services, a bill of expense with no means of reimbursement, and it has evidently deterred many from taking an active part in stocking the streams.

If we are correct in the above suggestions and facts, we feel persuaded that the board will agree with us in the following brief conclusions.

1st. That before making any further considerable expenditure, your committee should be fully advised as to the needs of the county.

2nd. That in stocking any water, the supply in the first instance should be sufficient for all practical purposes.

3rd. That the appropriation should be sufficiently large to enable your committee to pay the necessary expenses incurred in so stocking once, any pond or stream with any needed variety of fish.

If the board concurs in the above views, your committee believe that the appropriation for the coming year would have to be somewhat increased, and they therefore respectfully suggest that in their opinion an approriation of the sum of $500 for the coming year will prove in the end to be a wise expenditure of money.

In closing their report, your committee desire to express their sense of the great obligations which they are under to Mr. Seth Green, not only for personal favors and attention to your committee, but especially for the very liberal supply of fish furnished to our county during the past year.

DIGESTION AND GROWTH OF SUNDRY FISHES.

AN INTERESTING CHAPTER OF STUDY.

I AM now engaged in the business of fish culture in the far West, in sight of the turbid waters of the great Missouri, where I spend a great portion of my time, not only in cultivating the finer varieties of fish, such as the salmonidæ, but also in studying the nature and habits of those varieties which are indigenous to this country, and are commonly termed natives. For the purpose of being better enabled to study the habits of these last-named varieties during the fall of 1878, I had a dam constructed in my spring branch, immediately below my fish ponds, in such a manner as to form a small body of pure, clear water. In this I placed some 700 or 800 native fish of different varieties, embracing the beach bass, sheepsheads, buffalos, and pickerel. From the banks of this body of clear water I was enabled to see every movement of my finny pets, and many moments of leisure have I spent in watching their habits. The black bass (*Micropter pallidus*) would usually swim into the current, where he would sport about on the gravelly bottom, while the buffalo would retire into stiller water and browse in the grass and water-cress growing in the bottom.

Thus I ascertained their habits of feeding, and was enabled to determine what growth they would make in a given time without being fed artificially. Hence I seldom, if ever, gave them any feed. The buffalo (*Bubalichthys bubalis*) in a few weeks became attenuated, and began dying. This I attributed to their being in cold spring water with a current too rapid, and their not being able to procure sufficient food. The black bass, on the other hand, thrived amazingly well, and were making a most marvelous growth. This I attributed to the fact that they were in pure water of a uniform temperature. The bass, although found in all kinds of water, undoubtedly thrive best in clear, pure, spring brooks with gravelly bottom. The size of these bass when I first put them in this place was from four to six inches in length, and in less than three weeks had grown upwards of an inch. This, I must confess, notwithstanding I had implicit confidence in their making a rapid growth, astonished me much. I had always been a believer in heavy feeding, and felt satisfied that the amount of growth that would be derived in a certain time depended mainly upon the quantity of feed that had been consumed. This led me to speculate where these bass obtained their food, confined as they were in a very small body of water containing some 800 fish, and immediately below, my ponds containing some 40,000 salmon young and older. For the purpose of ascertaining this, I made my bass frequent visits, and by remaining quietly secreted on the banks, soon discovered the source of their food supply. One day as I was thus occupied, in company with my eldest boy (an urchin of ten years, and "all fish"), he called my attention to the fact that a snake (*Tropidonotus grahami*) was leisurely swimming through their midst. At first I felt inclined to pursue the snake, fearing that he might in some manner injure, if not destroy, a large portion of my native stock. My fears were, however, speedily terminated by one of my larger bass making a rapid dart at the snake with open mouth, and nearly severing its head quite close to the body. The scene that then ensued beggared description. Never shall I forget it—such a flounderings and splashing! The surface of the water for an instant seemed literally covered with perpendicular tails enveloped in foam. So great was the commotion that we were compelled to retire to a greater distance in order to avoid being thoroughly drenched. After the disturbed waters had become somewhat calmed we resumed our former position in order to make further observations, and found our large bass hero, with one end of the snake in its mouth, rapidly making away with it, and a smaller, but not less pretentious brother, at the other end, endeavoring with all his might and main to eat even with him. Thus these gamey lads continued for some time, swimming up and down the stream, like two boys running with a rope. The distance between them, however, rapidly diminished. This had continued for some time, when we saw emerging from under a log at the edge of the banks one of my pike (*Esox lucius*). At first he came slowly but steadily, when he made a rapid dart, with open mouth, at my smaller bass, and at a single gulp placed himself outside of it! Then he came face to face with our hero. It was an awful moment of suspense for some time. Our finny gladiators remained motionless, eyeing each other, measuring the dimensions of each other's mouth, as it were. The crisis at length came. The bass, by force of digestion, had made way with his part of the snake rope, and making one mighty effort, stretching maxillary and dental to their utmost capacity, soon enveloped the pike to a point just below the operculum. At this point we departed, feeling perfectly satisfied that our hero would take care of himself.

I presume it is unnecessary to say that I no longer entertain any doubts as to the ability of the bass to take care of himself, and that heavy feeding is indispensable to a rapid growth.

The above may, perhaps, seem somewhat fishy to a great many, but when we consider the structure of the bass, our doubts will be, in a great measure, abated. The variety above mentioned has a very large mouth—in fact, they seem all mouth, thus enabling them to envelope anything not exceeding their own circumference, with ample room for respiration through the gills. The œsophagus is very large (about the size of the stomach) and short. This enables them to take into the stomach all that may be embraced by the mouth.

The stomach of the bass secretes larger quantities and stronger gastric juices that that of any other animal, thus rendering their digestive capacities greater than those of any other living vertibræ. When we consider all these facts we can easily conceive that the above may be true. If, however, there are any doubting Thomases, they may be made to believe, if they will only visit my fishery at Council Bluffs, Iowa, as I still have the bass above mentioned, which has now grown into a whale. Should such parties, however, be unwilling to make so long a tramp, if they will only induce the FOREST AND STREAM to send that big fish-hook, I have no doubt that my bass might be transported by its assistance. WM. A. MYUSTER.

Council Bluffs, Ia.

FISH FOR PLANTING.—*Rochester, Dec. 15th.*—*Mr. Editor:*—The Commissioners of Fisheries of the State of New York desire to announce to the public that they are now ready to receive orders for the following-named fishes:—Brook trout, salmon trout, black bass, Oswego bass, rock bass, yellow perch, pike perch, or wall-eyed pike, and bull-heads. Orders will be received until March 1st, 1880.

Parties wishing fish to stock any of the public waters in this (New York) State should address the undersigned, and give a description of the waters they wish to stock, as the success depends on putting the kinds of fish in waters suitable for them. SETH GREEN.

TARRED HATCHING-BOXES.—*McCloud River, Shasta County, Cal., Baird Post-Office, Nov. 28th*—I see that Mr. Fred Mather says that Mr. Woodbury was not the first man who used cold tar on hatching-boxes. One thing that I can say is, that he is the first who ever used cold tar and asphaltum on hatching-boxes. Mr. Stone was against using it at first. They used their boxes charred at the first start of taking of salmon eggs on the McCloud River. Mr. Mather wants to give the credit to some one in France, whose name he does not know. He had better find out his name before he puts such statements in the papers.

I think it is better to give the credit to our own country. I am well acquainted with Mr. Woodbury; I am engaged in the trout culture, so it gives me a good opportunity to know what is going on. J. B. CAMPBELL.

RAVAGES OF PERCH IN LAKE MAGOG.—*Magog, Nov. 28th.*—What can we do? The perch here increased so fast the last few years that they are destroying all the lunge, or lake trout, in our lake. It is a fact there have been less caught the last year than ever before. The perch were put at the head of the lake about five years ago. Three years last summer they were first caught here at the outlet; now the lake is perfectly full in all depths from six inches to one hundred feet. They have not only taken possession of the lake, but have made their way up all the small streams, thereby destroying all the trout. They put into this lake a year ago some twenty thousand small salmon trout, and of course there was a million mouths open. There has never been one seen since. A. W. H.

A SECOND SUPPLY OF EGGS.—*Manchester, N. H., Dec. 20th.*—Commissioner Powers writes me this week that he has taken 100,000 salmon eggs and 150,000 trout eggs at the hatching house at Plymouth maintained by New Hampshire and Massachusetts. These salmon eggs will be hatched and returned to the Merrimac River. Bear in mind, that the salmon from which these eggs were taken, were artificially planted, and had returned 150 miles from the sea to the place where they were deposited. SAMUEL WEBBER.

A TEXAS FISH.

CORPUS CHRISTI, Tex., *Dec. 8th.*

Editor Forest and Stream:—

Enclosed I send you a pencil outline of a curious fish, which has appeared in the bays of this coast during the past summer, for the first time. He is known here as a pike, but he being a salt water fish, and without teeth, I am unwilling to accept that name. As you see by the draft, which was taken by laying the fish on the paper, and running the pencil around it, this fish is well provided with fins, and can go through the water like "shot off a shovel."

The spines of the back fin are five in number, and very sharp and strong, being as large as a lead pencil near the fish. Each of the fins under the fish has one large spine. The fin on the back, near the tail, was quite bony also, but covered with a thick, ghatinous covering, terminating in a soft edge. The tail was of this character also. The under-jaw projects beyond the upper, and ends in a rubber-like substance—a sort of a bumper. The upper part of the fish was of a dark green color, like a black bass caught in still water. There was a black satin stripe extending from the back of the head on each side to the middle of the tail. From the stripe to the belly the color brightened, until, directly underneath it was

nearly snow-white. The tail was a pure crimson red, much redder than a fresh gill of any other fish. The gills were four in number, and very heavy and strong.

This fellow was caught on a hook baited with a piece of mullet, and gave fine sport. The scales were as large as a silver five cent piece, and very soft and translucent. The flesh was white, firm and full-grained, and better flavored than any fish I tasted this year.

I can find no nearer description in "Hallock's Sportsman's Gazetteer," pp. 403, than under the head "Elacticdæ," the "crab-eater, cobia, sergeant fish," etc., but this description omits the most remarkable distinguishing feature, viz., the crimson red tail. When caught (Oct. 15th) it was full of spawn.

I trust this stranger will stay with us, as he is a very valuable food fish; but I am afraid that, like the gulf thread fish, he will leave when the shrimp do, to be seen no more until they return in August. BEXAR.

Having submitted the above description and the drawing to Prof. Theo. Gill, we have received the following identification, that proves our correspondent was mistaken about the teeth:—

The fish apparently belongs to the genus *Sphyræna*, and is, perhaps, the barracuda (*S. Picuda*), but if so, is erroneously stated by "Bexar" to be "without teeth." I know of no fish like that indicated destitute of teeth.

THEO. GILL.

FISH SWALLOWING FISH.

☞This contest is a go-as-you-please, but open only to amateurs. Professionals barred.

BOSTON, *Dec.* 13*th*.

Editor Forest and Stream:—

I am going for that hook, and this is the hand I do it on. A few years ago I was fishing through the ice for pickerel. They bit so fast that I had only time to cut one hole and tend the line by hand, hauling them out as fast as I could bait. Once, as I dropped in the shiner, and while it was in sight, two pickerel rushed for it at the same instant. The smallest one, of about two pounds weight, barely getting the bait as the other closed his jaws, catching far enough into the head of the first fish to be impalled with the hook, and both were safely landed, or iced rather.

WARFIELD.

Our correspondent says "honest Injun" this is true, and adds that some of the others are fishy. To be sure they are. Fishy or nothing.

WASHINGTON, D. C., *Dec.* 13*th*.

Editor Forest and Stream:—

Be good enough to listen to my fish story before you award that big fish hook. In the summer of 1875 the ship *Mary Schuyler*, of New York, Peterson, master, was cruising among the West Indies. The cholera broke out aboard of her, and several of the men were attacked. One of them, William Frith, died. He was duly prepared for his watery grave, by being sewed up in a portion of an old sail, together with an old grindstone, an axe and one or two other pieces of iron. These were to sink him at once. The preparations being completed, he was thrown overboard. His son, a boy of some ten years, who was on the vessel, was inconsolable at the death of his father. When the body was dropped into the ocean the boy jumped overboard, and before anything could be done to resue him, disappeared. Shortly afterwards an unusually large shark was seen following the ship, and attracted by its size some of the men determined to capture it if possible. The big hook was gotten out and baited. It was not long before the monster of the deep lay dead on the deck. As the men stood by admiring his size a strange sound was heard to proceed from the fish. The sound continued and the curiosity of the men was aroused to such an extent that they cut open the shark. They found that it had swallowed both father and son; that the boy had, with his pocket knife cut his father out of his winding sheet; that the father was not dead, but had only swooned, and the singular noise was made inside the shark by the father grinding the axe on the grindstone preparatory to cutting a way out of his living prison. C. B.

We shall not damn this truthful and affecting incident by any ill-timed faint praise. There are certain impressive occasions when silence is far more eloquent than words. The present is such an one.

ALBANY, N. Y., *Dec.* 9*th*.

Editor Forest and Stream:—

Although the "Man in Albany," has said nothing about "fish swallowing fish," it is not because he has nothing to say. In common with all old fishermen, I could supply you with a whole page of curious incidents in that line; but as I remember nothing which would eclipse "I. L. It's" alligator screed, I will make a cast or two in another direction which may provoke a rise from some new aspirant for the proffered medal.

Among the many genial men with whom my love of angling has made me intimate, I cherish with peculiar pleasure, the memory of the late Rev. Dr. Campbell of this city. His reminiscences were always interesting, because the pastime always brought to him other and higher pleasures than are to be found in the mere mechanism of the art. During one of these never-to-be-forgotten "sociables," I mentioned this incident. During my then recent visit to the North Woods I had taken a nine pound lake trout in whose stomach I found a large trolling hook in a state of perfect preservation. The fish was in splendid condition, and gave me as fine play as any one of the score or more I captured during that visit.

Thereupon the Doctor gave me this "Roland" for my "Oliver." "During my sojourn at Lake George last summer, I anchored my boat on the shady side of a pretty island, rather to read and meditate, than to fish. I took my tackling with me, of course, and of course, also, I dropped my line so that, should any straggling bass pass that way he might find something to amuse him. I became quite absorbed in the book I was reading before I was disturbed by so much as a nibble; and when the nibble came it was so slight that I paid no attention to it until it was so often repeated that I deemed it prudent to haul up to examine my bait. To my surprise, however, I was met by a very unusual resistance—indicating a fish of five pounds at least; and to my still greater surprise, when the resisting object came into view, I saw, not the head of a black bass, but the neck of a black bottle. That apparition was startling enough, but it was dwarfed into insignificance when, on examination, I found that my hook had been taken by a fish inside the bottle, and that (more marvellous still) the fish was as large as the body of the bottle and more than four times as large as the bottle's mouth."

If this story had been told me by any one else I would have simply whistled, and proceeded to match it by some equivalent marvel, drawn, of course, from that inexhaustible reservoir from whence come so many of those wonderful verities technically known as "fish stories." But I received it with becoming astonishment, of course, but with no shadow of doubt of its exact fidelity to exact fact. In due time I asked this question:

"How do you explain the mystery, Doctor?"

"There can be but one solution," was the reply. "That fish entered the orifice of the bottle in his infancy, and either because he liked his quarters or could'nt find his way out, he continued to live and wax fat until my bait dropped into his prison, beguiled him to his undoing, and gave me a new experience in our pleasant pastime. He weighed three-quarters of a pound. I had him for breakfast next morning, and he was the most toothsome morsel I ever knew to come out of the belly of a black bottle."

I saw then, as I see now, a chance to crack a score of jokes over this story, but, as you know, I am no joker, so I pass the opportunity over to those who think they are. G. D.

P. S. This story does not, of course, place me in the category of competitors for that hook, which as I understand it, is to be awarded to whoever shall tell the largest story of a fish (not a bottle) swallowing a fish." It is, of course, no great feat for a bottle to swallow a fish, for we all know how common it is to trace to the bottle the debris of massive palaces and landed estates. G. D.

Our readers will share with us the hope that "the Man in Albany," who can write more good things about fish and fishing than any other man in America, will not refuse to give us a farther installment from his store of angling reminiscences. We should write out his name in full had he not himself subscribed his initials; but then every one knows who he is.

HARTFORD, Conn., *Dec.*, 18*th*.

Editor Forest and Stream:—

The summer of 1868 I spent at Moosehead Lake, enjoying camp life with a merry party of sportsmen. When not fishing, we spent considerable time in rifle shooting. One day "Doctor," the genius of the party, proposed tying a quarter of a dollar to a long string and then fastened the string to the branch of a tree that extended over the water, so that when it swung to and fro we could shoot at it a-la Carver. After arranging it we went to dinner. While eating our attention was attracted by a crow sitting on the limb where we had tied the string, apparently untying it. Being untied, the string slipped so as to allow the silver piece to touch the water, when to our astonishment it was immediately seized and swallowed by a large perch. The crow by this time had obtained a good bill-hold on the string and the contest between them was very exciting. Several times the crow, by diligent use of claw and bill, succeeded in lifting the perch out of the water. Finally, just as its tail was leaving the water, there was a rush and we saw the perch disappear in the mouth of a four-pound trout. The combined weight was too much for the crow, and the string slipped so as to allow the fish to regain the water; but the crow quickly seized the string with its bill, and then commenced the most exciting and novel struggle that was ever witnessed. The trout was darting to and fro, and the crow was tipping and bobbing, owing to the struggles of the fish. Never did an expert disciple of old Isaac play a fish, with light tackle, better than did this crow, and we were betting high on the crow to win, when to our surprise the bird was jerked from off the limb, its feet becoming entangled in the string, the fish swimming out into the deep water of the lake, and the crow flying to keep up. We watched the crow for nearly an hour, when from exhaustion it dropped into the water, and was lost from view. But now comes the singular part of the story. The next forenoon Doctor and I were fishing with live bait, from separate boats twenty yards apart, when I had a heavy strike and hooked my fish—it proved a ten-pound pickerel. Upon landing it I was surprised to find two lines in its mouth. I related the fact to the Doctor, who had also just captured a fine pickerel, and was surprised to learn that his fish also had two lines in its mouth. We each pulled in the line out of the water, and to our mutual astonishment we found each had hold of the same line, so we pulled the boats together by it, and proceeded to investigate by dissection the strange case. Upon opening my pickerel I found a four-pound trout with the line in its mouth, and in this trout I found a perch, and in the perch, at the end of the line I found the quarter of a dollar that we suspended from the tree. A dissection of my friend's pickerel disclosed our fisherman crow entangled in the line. As we were in the dissecting business, we dissected the crow, and in its stomach we found seventeen minnows, three hair-pins, a red string, several trout flies, and a gold badge that I recognized as one I lost the year previous when on a fishing tour to the Thousand Islands.

Please place the above truthful occurrence to the credit of NUTMEG.

The Editor of this paper has come to a realizing sense of his awful responsibility for tempting his brothers of the rod to perjure themselves. Now let him say, once for all: If any man contemplates the attempt to out-tell the specimens of American fish fiction published in to-day's FOREST AND STREAM, he must do so "on his own hook." We disclaim all moral responsibility for the action.

ROCHESTER, N. Y., *Dec.* 13*th*.

Editor Forest and Stream:—

That story by "J. L. R.," regarding the minnow-turtle-moccasin snake-trout-alligator, was a good one, but I think he will not be awarded the big prize fish-hook, if a certain boy who used to live in this State is alive. I refer to the one who some years ago was out boating with his mother on (I think) Conesus Lake, and while gazing from the stern of the boat into the water had his nose seized by a large salmon trout, which he pulled into the boat hanging from his nasal organ! Was there ever such a hook and line used before or since? The truth of this story is vouched for under oath, and photographs of the boy with his lacerated nose and the fish were sold as curiosities. E. R.

Our correspondent is guilty of a slight inaccuracy. The boy was sitting in the bow of the boat, with his nose running aft and trailing astern, rigged with reel, line and trolling spoon. Who couldn't catch a fish with such a rig? This was the boy, too, we believe, who hoisted his ears for sails.

—A double-shell race—clams.

Natural History.

NOTES ON APLOCERUS COLUMBIANUS.

THIS animal, known also as the white goat, mountain goat and ibex, is much more numerous than commonly supposed to be. It abounds in British territory from its southern to its northern boundary, and is not confined to the Rocky Mountains; but I am inclined to believe, from the best information to be obtained, that it is even more numerous in the Cascade and Coast ranges than in the Rockies. However this may be, it is undoubtedly plenty in all of the above named ranges, and the general impression of its rarity probably arises from the fact that its skin is not an object of trade, and consequently is seldom seen except in close proximity to where the goat lives. The skins are shorn by the Indians of all, or nearly all, of the different tribes on this coast. The wool is spun in the most primitive kind of manner by the the squaws, who twist it on the bare knees with the palm of the hand. This yarn is woven into blankets on a very rude kind of loom, by passing the weft over and under the warp with the hand, without the use of a shuttle or other appliance. These blankets, although occupying a long time in their manufacture, are still very common among the Indians, and at one time constituted their principal coverng, especially among the tribes living on the coast. The manufacture of these blankets is yearly decreasing, however, owing to the importation of American and English ones, and other causes; and it is safe to conjecture that this species of goat is on the increase, instead of decrease, as the fleece, and not the flesh, was the object sought for by the Indians. Not that the flesh is unpalatable and inferior, but that other pursuits are less arduous and more profitable; and among our Indians hunting is not so much practiced as when it was a necessity. The old adepts are fast dying off, and the young fry pay more attention to working for the whites as servants, mill hands, salmon fishers, cattle herders, etc., than to hunting, the last twenty years having made a great change in their mode of obtaining a livelihood.

The flesh of this species resembles, in some degree, mutton. That of the kids is exceedingly delicate, has a slight gamey flavor, is eaten by both Indians and whites, and by some of the latter is preferred to venison.

The home of this animal appears to be about the snow line on the mountains. It is rarely, although occasionally, seen in the level bottoms. On one occasion I saw a goat shot by a person sitting in a canoe on salt water. It is more than likely that at times they pass from one mountain to another, and to do so must necessarily descend to the valleys; and these, perhaps, are the only times that they are at low altitudes.

They are gregarious at all times of the year, and flocks or bands comprising as many as twenty to thirty individuals are not uncommon, but a smaller number may be assumed to be the rule.

They breed but once a year, and have two kids at a birth, which are brought forth in May and June. The period of gestation, for obvious reasons, is unknown.

They are very fleet in their rocky fastnesses, and know no fear in ascending and descending the most abrupt places, and the use of dogs of any kind in hunting them is not worth attempting; the only means of any avail is by stalking, or as it is termed here, still hunting. The faculty that is accredited to them, of jumping down heights and alighting on their horns without injury, is a myth, pure and simple. Why this animal should be classed by naturalists as an antelope, I fail to see, as in its looks, habits, and other characteristics, it is a complete goat, if there is such a thing.

Both sexes bear permanent horns. They are very fine grained, of an intense, or jet black, susceptible of being very highly polished, and the upper parts, or ends of the horns, have a very fine natural polish. They vary in length, but I think that eight or nine inches in length would be a fair average. They are curved backward and outward, being much wider apart at the tips than at the butts. They are corrugated, or wrinkled at the base, and the general idea, and a plausible one too, prevails, that these denote the age of the animal, in the same manner as do the wrinkles on a cow's horn. The tips come to a very sharp point which would be effective in goring, and in this respect suggests the idea of defence and offence, more than do the horns of the common goat, whose chief line of argument appears to be butting.

The coat is of two qualities, namely: a fine white wool next the skin, of a fine grade, and a long white hair, straight and stiff, coarse in texture, never curly, as is the wool in the domestic sheep. Sometimes the coat assumes a dingy white or yellowish cast, but white is the normal color.

This species is extremely tenacious of life and will often escape though desperately wounded.

It may be said to never come to bay, at least in the sense that a deer does; but when hard pressed will some times turn on its pursuer when no other means of escape is practicable. In support of this I may mention a circumstance that came to my knowledge, by which a fine young Indian of my acquaintance, "Wyhee" by name, met his death. He was a noted goat hunter; for almost all of these Indians have their particular forte, one being a bear hunter, another a cance maker, another a deer hunter, etc., etc. "Wyhee" had wounded a buck goat, which while endeavoring to escape got upon a narrow ledge or shelf, terminated at one end by a bluff which no animal could get around or pass, and the goat was so to speak corralled, as the Indian came in by the other end. "Wyhee," thinking that he had the goat at his mercy, cut a sapling, sharpened the end, and advanced with the intention of spearing the goat—Indian-like, wishing to save another charge of powder and lead. When close to the goat, however, it turned upon him and knocked or butted him off the shelf, and he, falling hundreds of feet below on the rocks was so bruised and mangled that his body, when recovered by his friends, was hardly recognized as the remains of a human being.

In regard to a third description of sheep or goat other than this kind and the "Bighorn" (*Ovis mon tana*), I believe it is all a yarn. My reasons are these:—No skin head, or horns have, ever reached any scientific institution or naturalist except those of the two above named no hunter, trader, trapper, gold miner, or Hudson's Bay

employee that I know, and they are very many, have ever seen any such an animal; no Indian that I have come across has ever seen or knows about the third sort; and surely some of these men who have travelled nearly every foot of territory and lived at various localities from Mexico to the Arctic Circle, would at least have seen one; and if such an animal does really exist, how highly improbable it is that at least one specimen would not be forthcoming; and in the absence of any proof whatever, it is strange that any one believes in the existence of such an animal.

Both sexes of the white goat have beards, but this appendage is much more prominent in the male than the female, being very much larger and longer. Like all other mountain animals it is more easily approached from above than below. It is not easily frightened by a noise, being much accustomed to falling rocks, avalanches, etc. And the report of a gun does not disturb it to any extent. You may empty a Winchester rifle magazine at them without startling them, provided they do not see you or get your wind; but should they smell you it is all up. Away they go like a streak of lightning. There sense of smell is exceedingly acute, and they "snuff danger from afar" in the highest degree. A knowledge of these facts is requisite for the successful hunting of all ruminants, but no more important with others than in hunting this species.

A two or three hours' climb from the beach will, in many places, bring you into the goat country. A little care and skill will usually insure success in their capture, but the sportsman who would engage in this kind of sport must be steady of head and sure of foot, for the prey he seeks is completely at home where one would imagine a cat or any animal short of one possessing wings would be unable to travel.

Among the Indians of early times, to be a successful goat hunter was to be a man of note in the tribe, a husband to be sought after by the dusky damsels looking for a helpmeet, as he was able to procure at the same time food and clothing—two very desirable things in domestic economy. And after his death this qualification insured him a sarcophagus, which was placed on posts in "the village of the dead," and emblazoned with representations in relief of the animal in question, as a memento of his prowess in this particular line during his lifetime.

These animals are often captured young, but I am not aware of any having reached any museum or zoölogical collection. One passed through this place a few months ago, on its way, I was informed at the time, to Woodward's Garden, in San Francisco; but whether it reached there or not I have never learned. Another one, kept by a friend of mine for a year or so, became very tame and much attached to his master, whom he followed about the village of Hope (about eighty miles from this place) like a dog, and appeared to thrive as much in captivity as in his native state. He finally became a victim of a "fool with a gun"—the general fate of pets of many kinds—being mistaken and shot for a wild goat, though wearing a bell on its neck to protect it from being molested. Another friend of mine had two kids for a period of two or three months. They died from some disease of the kidneys, probably induced by improper food or treatment. They were very tame and playful, and an idea of their activity and sureness of foot may be had from the mention of this act: Although quite young, they would spring from the floor of the stable in which they were kept, alight upon the chine of a flour barrel, head out, poise themselves there, spring thence, and alight on the edge of the manger, jump back to the barrel again, and appear to be as much at home as on the floor.

I am sorry that I have not taken the measurements of some of these goats when I have had an opportunity, but will do so the next chance I have, and will send them to you, if it would be of any interest to you. Why I have not done so is probably owing to the fact that ordinarily, when an animal or bird is easy to be obtained, little or no interest is aroused, while if extremely rare, the reverse is the case.

I hope that some of your Eastern readers may yet add to their list of sporting honors the killing of a good specimen of this goat; and it is by no means unlikely they will be able to do so, more especially when, by means of the Canadian Pacific Railway they are brought into closer relation to the hunting grounds on the Pacific slope. Perhaps the editor might yet honor us by extending some of his vacation rambles thus far westward.

MOWITCH.

New Westminster, British Columbia, Nov. 7th.

THE MIGRATORY QUAIL.

BOSTON, Dec. 15, 1879.

Editor Forest and Stream:—

Noticing your remarks in reference to the importation of migratory quail, and my connection therewith (paper of Dec. 11th, 1879), I take occasion to say that I had supposed my experience as an importer was to close with the shipments of last spring. I have, however, received so many inquiries during the last month or two, that it is pretty evident that there are a large number of people who would like to import quail, but do not know when to send their order, how to remit their funds, how to get their birds through the Custom House, how to get them forwarded from the steamer to their respective destinations, and who, in the lack of this information, are likely not to import. Advices from Mr. Braun, appended hereto, indicate a possibility that the exportation of birds from the kingdom of Italy will be forbidden after this season. In order, therefore, to assist in getting as large an importation as possible this year, I offer my services free of charge to any gentlemen who have not facilities or time for managing their own importations. I am expecting to receive, in the course of two weeks, from Mr. Braun, a full statement of his prices and terms for the coming season, which will be at once forwarded to you for publication. His prices last year were graded, according to quantity. All the orders which were put into my hands were consolidated into one order, which was large enough to secure the greatest wholesale discount, and each purchaser consequently had the benefit thereof. I presume a similar gradation of prices will be made this year, and if so, the orders going through my hands will be massed into one order to obtain the discount.

All the responsibility that I assume in the matter is as follows: I will receive any money that may be sent me, and will buy foreign exchange with it, which I will remit to Mr. Carl F. Braun, Messina, Sicily, with full instructions in reference to the shipping marks upon the cages ordered. Upon the arrival of the birds in New York I will see that they are passed through the Custom House, duty free (unless there is a change in the tariff laws in regard to them, which is not likely), and will also see that they are delivered to the express companies to be forwarded to their respective destinations.

By way of contributing my mite towards furnishing your correspondent, W. R., with the information asked for by him in your issue of Dec. 11th, I give the following extract from an article written by myself for publication elsewhere, but which seems to hit his case: "A batch of 200 migratory quail released by me in the town of Wareham, Mass., last summer, mated, nested, reared their young, were seen occasionally through the summer, and have now left, presumably for the South. Evidently they take kindly to our climate, and evidently also their instincts will preserve them from the heavy snows and severe cold of our winter, which prove so fatal to our native quail. This part of the problem having been solved, I am now awaiting with interest the solution of the remaining branch, namely, will they return next spring to the spots at which they were released?

There would appear to be odds of ten thousand to one that the birds, flying down the length of our continent, spending the entire winter in the South, and spreading over thousands of miles perhaps in their ramblings there, would not return to this same State; and still more, to a particular county in this State, to a particular town in that county, and finally to a particular wood-lot, brook and meadow in that town. Yet the evidence is fast accumulating to prove that they will do so. Here is the latest instance:

In the town of North Falmouth, on Cape Cod in this State, is a long, wooded peninsula known as Nye's Point, and owned by Mr. Downer. In the summer of 1878 Mr. Downer released upon this point a batch of migratory quail. In time they bred, raised their young and disappeared. In the late fall of last year not one was to be found upon the point. In the early part of November of this year two large flocks of migratory quail were found upon that same wooded point from which they had taken their flight the preceding year. How many more could have been found by searching is unknown, as it was not desirable to disturb or harass the birds. Presumably the two covies accidently walked up were but a small portion of the birds that had returned to take possession of their old quarters. Such instances are very encouraging for those Northern and Western sportsmen who are interested in the introduction into this country of a rapidly breeding, thoroughly game bird, adapted to furnishing abundant sport, and able to protect itself by its migrations from the deadly winters of the North and West.

I enclose copies of my latest advices from Mr. Braun, and will promptly send you his list of prices, which should soon be here. HORACE P. TOBEY.

MESSINA, *Sept. 10th.*

Mr. Horace P. Tobey, Boston:—

DEAR SIR—Your valued favor of the 23d ult. came duly to hand, also three numbers of FOREST AND STREAM.

I am glad to see by the papers forwarded to me that the importers of the quail seem to be perfectly satisfied with the result of this year's importation, which certainly could not be expected to come out any better.

The fact that many of the quail previously imported have returned from the South, shows that the stocking of the birds in the States can be considered a success. Of course, with the comparatively small quantities imported up to the present, it would be difficult to find out whether the birds return to the exact spot at which they are released. In my experience with quail in Germany I have found that in most instances the quail return to the same spot where they have nested before, provided that no particular change has taken place in such localities, which might disturb their family life.

Have you much rain and heavy storms in the months of June, July and August? This influences largely the increase of the birds. The releasing of the birds ought to be done in places which are fit for their nesting, and as the quail usually nests where it can find plenty of food near, your importers ought to put the birds at liberty only in such localities, if they want to have them return to the same spot where they were originally released; or else the birds will look for a more convenient place in the vicinity.

No doubt, if your sportsmen continue importing the quail on a larger scale for the next year to come, they will soon see the benefit of it, and can before long avail themselves of the pleasure of shooting the birds, provided they meet with a good reception for the first years in the Southern States.

The birds which have up to this time been imported into your country are, with their descendants, scattered all over the States, and can, of course, hardly be noticed in such a large space. The quail increase, however, very rapidly, and if your sportsmen continue importing they will soon see our quail plentiful in the States.

Nothing new as yet, as regards giving out licenses for the next season, for catching the quail in this island. Hope, however, that the matter will be decided favorably before long. CARL F. BRAUN.

MESSINA, *October 29th.*

Mr. Horace P. Tobey, Boston:—

DEAR SIR—I wrote you last on the 10th ult., and have since none of your valued favors to reply to.

The object of these few lines is to inform you, that a law has been given out by which the pay for the licenses for the quail catching has been raised to £60 sterling, and, according to which, every catcher has got to have a different license for each property he wants to catch in. This circumstance will no doubt influence the prices of the birds considerably the next season. The sportsmen here have protested against the catching of the quail, and it is said that the law will be passed by which the catching will be prohibited entirely in the whole kingdoms of Italy. If so, the importation would be at an end; but I think that if such a law is to be passed, it won't come into force until after next spring, so that the next year's importation would be the last, for which I should be very sorry. I think it would be well if you would make this known to your sportsmen and quail importers, saying, that perhaps next spring there will be the last opportunity to import the quail.

CARL F. BRAUN.

LAKEVILLE, Conn., *Dec. 15th.*

Editor Forest and Stream:—

In answer to "W. R.," Quebec, in your last issue, I am happy to say that the migratory quail imported by our club a year ago last spring returned and hatched in this vicinity in considerable numbers this season. They stayed with us later this season than last as indeed our woodcock or native song bird, did. I saw a covey myself the last week of September consisting of about ten or a dozen well grown birds; and I heard of a covey of about twenty late in October working on buckwheat stubble. Last season I think they all left some time before October 1st. I feel satisfied that they will prove a valuable addition to our list of game birds, especially in the North, where Bob White is winter killed to as great an extent as with us; and also I am satisfied that they will be an early bird to shoot and will be in season by September 1st if not sooner in this locality. They must grow with marvellous rapidity, as I have not heard of their arriving here before May 1st, and all that I have seen in August so far seemed to be full grown. We have not killed any here yet, preferring to have them get well settled first. Ruffed grouse suffered severely here from wood-tick the past season, and woodcock were scarce. W. H. WILLIAMS.

SARATOGA SPRINGS, N. Y., *Dec. 18th.*

Editor Forest and Stream:—

It gives me great pleasure to state that a migratory quail was observed a few miles north of this place on several days of last September by Mr. Geo. P. Reynolds and others. He unhesitatingly pronounced it a quail, but said it was the most curious quail he ever saw. He did not know such a bird had been introduced into this country. On being asked to give a description of it he did so; his description of its size, color, flight, etc., being, almost precisely like that of Mr. H. P. Tobey in your issue of Dec. 11th. It could not possibly have been our common quail, as they do not occur in this section. It was undoubtedly a *bona-fide* migratory quail. J. W. S.

A MULE-FOOTED DEER.—Our reader will remember that some time since Dr. Elliott Coues, in the *Bulletin* of the U. S. Geological and Geographical Survey of the Territories, called attention to the breed of single-toed hogs which appears to be well established in Texas, and lately a somewhat similar case has been noticed by Prof. Cope in a deer. The specimen in question came from Mendocino County, California, but as nothing but the feet were preserved it is uncertain to what species of the genus *Cariacus* it belongs. The most interesting point about these feet is the fact that according to Prof. Cope, in the fore-feet only one toe is fully developed, all the others being rudimentary. In the hind-feet, however, the two toes were continued to the hoof, but were united throughout.

We should be glad to know whether the toe developed in the fore-foot is the third, as we should expect, or the fourth.

A WEST VIRGINIAN SQUIRREL STORY.—A correspondent, J. W. C., jr., of Oneida, N. Y., sends us an extract from the Wheeling *Intelligencer* of Nov. 6th, which contains a curious story. Our correspondent, though having no personal knowledge of the occurrence, states that he has heard several responsible men say that they saw several squirrels after they were killed, and he is therefore willing to vouch for the truth of the story. The tale runs thus:—

One day last week while Jessie Huff was out hunting near Dallas, he saw a squirrel, as he thought, in a tree. He took aim and fired: but still the squirrel remained stationary. He repeated the firing three times in succession, thinking that his gun had gone back on him, until the last of the three shots fired, when to his surprise down tumbled four squirrels, all joined together. After the three were shot they pulled the other one off, not being able to hold them up. They were joined together by a narrow strip, so that one could not move without the other, and had been born that way and were all grown. It is the talk of the whole neighborhood.

ZOÖLOGICAL NOTES.—In the FOREST AND STREAM of Nov. 20th Major Merrill speaks of the abundance of the Carolina rail (*Pozana Carolina*) in Wisconsin. I have never met with it in that State or in Minnesota, but I have seen and killed a great many in the vicinity of Fayette, Iowa, at different times. I am inclined to think it nests in that locality, although I have never seen it before the middle of August; but during the fall grouse-shooting, rail are quite plenty.

Many a time I have enjoyed a hearty laugh at a certain tyro, who in his excitement and anxiety to bag a grouse has fired at an ortolan, mistaking it for the noble *Cupidonia cupido*.

Nov. 6th, my friend, G. F. Benson, Esq., Lake City, Minn., shot a fine white swan, probably *Cygnus americanus*, in Lake Pepin—rare in this locality. He is having it mounted.

Last summer I was so fortunate as to secure a Melanotic pocket gopher—I forget the technical name—in Minnesota. Although I have skinned a large number of these gophers, this is the first black specimen I ever saw, or heard of, for that matter. Albinos are frequently met with, at least I have known of two being caught within a year. I consider my specimen a *rara avis*, so to speak.

The trout-fishing in Wisconsin was not as good this year as last, when we all had such a merry and successful

day. The spring rains washed out the dam twice, carrying all the larger trout in the stream into Lake Pepin. It is supposed that they struck the current which runs near the shore, and went up to help stock Rush River, Wis. WALTER PORTER MANTON.

Boston, Nov. 24th, 1879.

KING DUCKS ON THE NIAGARA.—*Buffalo, N. Y.*—Buffalo gunners on the Niagara River in late fall make use of small steam-yachts on their sporting excursions, since the strong, four-mile current of the river renders small boats unsuitable for long trips. A party of five bagged on the 22d of Nov. eleven specimens of the king duck (*Somateria spectabilis*) in immature plumage. These birds are strangers on the Niagara, and their specific identity puzzled therefore their captors, who encountered them in small flocks of from four to five specimens. They were by no means shy, and allowed the steamer to approach within less than twenty yards, when they would readily dive, to reappear at a long distance. The fierce storm which raged the day previous along the lower lakes accounts for their adventitious occurrence, and they have followed undoubtedly the course of the St. Lawrence River to Lake Ontario, whence they made a short cut towards Lake Erie. There are also now on the river as permanent winter residents a few scattered flocks of the common Merganser intermixed with some blue bills and whistlers.

QUAIL AND PARTRIDGE.—A correspondent has written asking whether there exists no difference between a quail and a partridge, stating that Philadelphia marketmen affirm that they are one and the same bird. The question, as put to us, is a difficult one to answer, for we are ignorant to what birds our correspondent refers under these names. If he speaks of North American species, we must answer that the quail of the Northern and Western States is the partridge of the South. The bird called partridge in the Northeast and pheasant in the South and West is neither a partridge nor a pheasant, but a true grouse.

The quail (*Coturnix*) and the partridge (*Perdix*) (of Europe) are two entirely different birds, and unlike any North American species, though belonging to the family *Perdicidæ*, in which our Bob White, the California quail, and several Southwestern species are placed by ornithologists.

The Kennel.

A FEW WORDS ABOUT SPAYING.

BY COBWEB.

THE stimulous which has been given to canine matters by the various bench shows and field trials in this country, besides improving the various breeds and checking to a greater or less extent the indiscriminate breeding of former years, has caused the owners of valuable brood bitches to seek a means by which their stock should not become too common, and by which they could partially, at least, control their particular strains.

This was found in the operation of spaying, or removal of the ovaries; and the demand for information respecting it was promptly met by articles by "South Fork" and other writers in FOREST AND STREAM, and a very practicle article by "Mohican" in the *Country*, June, 1st, 1878.

It is not my purpose at this time to give in detail the manner of performing this operation, but simply to offer a few practical hints respecting it, derived from my own experience.

Make the incision just below the navel, or belly, button (*umbilicus*) in the median line; no other place is as good. The cut at the side is awkward to make and does not heal so readily.

Make the incision only large enough to admit the index finger; this gives ample room to find the ovaries, and there will then be little danger of protrusion of the gut, or a hernia following the operation, provided care is taken that the stiches go completely through the entire thickness of the abdominal walls; this is most important to insure a firm and lasting union of the wound—a common error being to include merely the skin in the stitch. If enough stiches are used to completely close the incision, plaster will not be required; but, if thought expedient to use it, it should be made of dextrine and spread upon kid. This kind of plaster is the only one, in my experience, which will remain upon a hairy surface, the warmth of the body causing it to adhere, while the common surgeon's adhesive plaster, being comprised of litharge and oil, is readily softened by the animal heat, and drops off or slips.

The dextrine plaster, in my hands, has cured a very persistent case of external canker of the ear; such a case as it would often be recommended to round the ears, and then probably to no purpose.

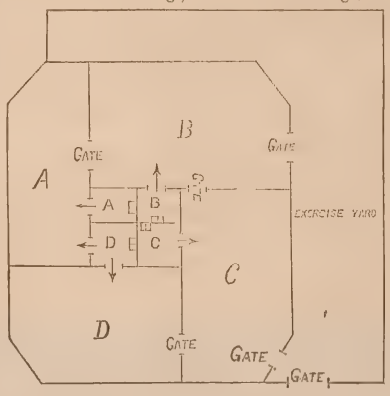
In your "Answers to Correspondents," for November 20th, 1879, the following question and answer appear:

Query: "I have heard it said that a bitch would get in heat, even after being spayed. Is there any truth in the assertion? Ans. No; not if the spaying had been properly done, and the ovaries removed."

Of course, if the ovaries were removed, she would not become pregnant. But spaying does not always prevent the bleeding; particularly if before the operation she had already "come in" once or more times, or was about to do so just before the operation.

The following case is one to the point. Over a year ago received the following letter from a friend:—

"My reputation is now at stake, and I wish to ask you a question. Could a bitch, properly spayed, about nine months old, come in heat in two or three weeks after the operation, receive the dog and have pups?"



Of course, the opinion was given, which time proved correct, that there would be no pups. Such would not have been the case, however, had there been an extra or supplementary ovary, as in the following instance, related by Dr. T. Gaillard Thomas, of New York, in the New York *Medical Record* for December 6, 1879:—

"A bitch, which had been spayed, continued to oestruate just the same as before * * * *. After a time she became pregnant, and gave birth to pups * * * * although both ovaries had been completely removed. There was undoubtedly present in this instance of a supplementary ovary (the *ovarium succedaneum*, as it is called)."

The plaster, if used, can be removed by the third or fourth day; silk or silver sutures, or stitches, as soon as they become loose, or a drop of matter is seen where they pierce the skin. If carbolized catgut stiches are used, the internal portion usually becomes absorbed; for which reason they are to be preferred, as they thus take care of themselves. COBWEB.

APPROVED DOG KENNELS.

To the many who are interested in, and who breed fine dogs, I would like to suggest that a most convenient kennel and yard can be built for a reasonable amount, after the following plan, which I confess is not original, but borrowed from that prince of sportsmen, Gen. W. B. Shattuc, of Cincinnati. I recently visited his home in Madisonville, Ohio (a suburb of Cincinnati), to purchase his brace of champion Irish water spaniels, Barney and Judy, and I am happy to say they now belong to the Valparaiso Kennel Club; price paid $400. Barney and Judy are elegant. Judy, I understand, came over in bad condition, and when received by you from the steamer was not very highly thought of; but were you to see her now, with her elegant new coat and splendid flesh, you would say she was simply perfection. Gen. Shattuc has a splendid house and beautiful grounds, some eight or ten acres, beautifully laid out by an artistic landscape gardener. His kennels are so convenient I could not resist the temptation to let all interested use his plan if they desire to do so. Such a kennel will easily accomodate ten to fourteen dogs, and not crowd. The ground

The yards *a*, *b*, *c*, and *d*, are about 2x4 rods each; the rooms each 6x8 feet, which are neatly roofed and well ventilated. The fence is of pickets 2½in. wide and 7 feet high, 2½in. space.

should be covered with gravel, and earthen vessels used to feed and water in. I would like to mention Gen. Shattuc's recent addition to his kennel—the splendid smooth-coated St. Bernard bitch Brunie. She is perfectly marked, according to the "Gazetteer" and other authority. Her condition when received from New York—where she was left by Rev. Macdona, who imported her—was simply frightful; but to-day, just four weeks since her arrival at Gen. S.'s, she is in perfect condition, and I understand he only used the remedies found in Hallock's "Gazetteer," and he could not say enough in praise of the book. It is his intention to breed Brunie to imported Marco. I hope he will do so. Thorstein, his crack red Irish setter, is more beautiful than ever, and is under perfect control. There can be no better broken dog than Thor, and certainly none more loveable.

It is my intention to breed Barney and Judy and break the whelps in our wild rice marshes; for I believe, if taken early, they can be taught anything, and I certainly never saw a dog love water as well as these.

W. H. HOLABIRD.

BI-PEDAL DOGS—IS THEIR PECULIARITY TRANSMITTED?—*Editor Forest and Stream*:—An article in your paper of Dec. 4th, upon Bi-pedal Dogs, reminds me of one or two facts within my own knowledge.

Several years ago I had a few sheep upon a farm in charge of a tenant. One of the ewes dropped a lamb one cold night in February, and before it was found both of its hind legs were so frozen up to the hams that when I saw it a few days afterwards they were hanging by the sinews, which I had cut, of course. This lamb had learned to walk upon its fore legs, its hinder parts elevated in the air, and followed its dam about the rough barn yard over the corn stalks which were thrown there for feed. It was as active as any of the other lambs. We kept it with the other sheep until it was old enough for spring lamb, when it was killed, and found to be fat and healthy. I afterwards regretted killing it. It suckled from a sitting position—a posture I have never noticed any other sheep to take.

In the article named, you speak of a short-tailed dog transmitting the peculiarity to a third generation. Some years ago I knew a very fine and intelligent black rat terrier with a caudal stump not over an inch in length. The owner had procured her in Buffalo, and told me her dam was also "stump-tailed," as he expressed it, and had been brought from England, and that he had been told by the owner it belonged to a naturally short-tailed breed. I procured one of her first litter of pups, which were all short-tailed, and as it happened, all females. In due time I bred mine to a black and tan of ordinary appearance and build, and her first litter of two were both long tailed. Her next litter had two short-tailed pups and one with a tail of about three inches long. The third and last litter was three, one of which had no tail at all; one a tail of about one and a half inches long, and the third, now in my possession, a tail of ordinary length. So that in this case, I know of the third generation with this peculiarity, and have no doubt about the fourth. If my informant had been correctly informed as to the breed, as to which he, of course, knew nothing, the defect had been transmitted for many generations. C. C. H.

SQUIRREL DOGS.—*Elizabethtown, Ky., Dec. 13th*.—In your answers to correspondents, you carelessly say, in answer to a Martinsville, Ind., correspondent about squirrel dogs, that, "Unless a dog can climb a tree, we do not see how one can be used in squirrel shooting." Now that sounds as if written by a man who never hunted squirrels, as we hunt them in the woods of this country, where the underbrush is so thick you cannot see fifty yards ahead of you. Therefore I take it upon myself, to enlighten both you and your correspondent upon the subject. In the first place I will say, it is necessary to have a dog to "tree" the squirrel to show you where the animal may be looked for; for, if you depend upon your only power (vision), you may walk the woods over and never "bag a bunny." I once owned the best squirrel dog I ever saw. She was a black and tan terrier of full size, and active as a cat. Her mode of procedure was, if the wood was open, to stand on the fence, or on some high log, and scan the wood with her never failing eyes, and, if a squirrel was in view, to run him to a tree, or to go to the tree he was in, and then to watch me. If I did not respond, she gave a few, quick, sharp barks, and ran up the tree as far as she could, so that, after hearing her, I might see her. If the wood was thick, she would bark as soon as the squirrel was treed. She was a very valuable dog for the purpose, and was self-learned. The only training she got was being allowed to go along when I went hunting. No particular breed of dogs is indicated; but I think one that has a fair degree of intelligence and don't bark too much, is best. I have seen common curs do well; in fact, have seen squirrels hunted with setters and pointers, they treeing and barking as well as any dog; but I think a smart black and tan ratter the best of all. M.

[In treeing squirrels, any fice or whiffet makes a good dog; but we have often thought that a cocker spaniel would serve better than any other. The question to which you refer, was not answered from the Kennel Department of this paper, and the answer ought not to stand. We thank our correspondent for calling our attention thereto, as well as for his comments.—Editor FOREST AND STREAM.]

AN OUTRAGE.—*Owego, Dec. 8th.—Editor Forest and Stream*:—Last Thursday night, or early on Friday morning, some low, mean, unprincipled wretch entered the premises where my dogs were kept, and threw poisoned meat into the kennel. About 7 A.M., Mrs. Hill, a neighbor, seeing something unusual at the kennel, looked in and saw Zipp, my red Irish setter, lying dead, and Tony, as she supposed, dying. She ran to the house and gave the alarm, and they succeeded in saving Tony. My dogs were at my brother's, in Corning, and were kept in a yard and not allowed to run in the street or trouble any one; and I cannot think of any reason for poisoning them. Zipp was a grand bitch out of York and Nora, and I never expect to own her like again. Mr. Quist, a neighbor and brother sportsman, rendered valuable assistance, and I feel under many obligations to him. H. B. STOLL.

THE ENGLISH MINER AND HIS DOG.—The dog is man's friend all the world over, and never a more beloved companion than among the humbler classes. An English contemporary has a very interesting sketch of the North of England miners and coke burners, whose labor is exhaustive, unpleasant and often dangerous. There was a happy era, in the Franco-Prussian War times, when the iron and coal interests were active, when the coal mine workers decorated themselves with heavy gold chains and fed their dogs on sirloin steaks. But it is not so now:—

Times have changed, and with none more than the pitman, the coke drawer, and the ironmaster. Mines are closed, ovens are cold, and grass grows in the deserted ironworks. Geordie's principal occupation nowadays is to play ball or marbles, and to whistle for better times. Taking him on the whole he is'nt a bad sort of fellow, and quite as good as his neighbor. His work (when he has any) is heavy, and the risk great. We who owe so much to his labors for our personal comfort and the working of our machinery, should not begrudge him his wages. It is not child's play handling the pick underground or working before a coke oven; but such as it is, thousands of sturdy fellows would be glad to be busy at it to-day. The story of Geordie's life is soon told. The colliery village is adjacent to the pit. The houses—which are not all models—are owned by the mine owners, and stand back to back. For the most part they are—or rather they used to be—well furnished, neat and bright. The womenfolk are not a sight to turn a man's head from. You will find as buxom, pretty and blythesome specimens of the fair sex among the miners' wives and daughters as anywhere in England. In many cases there is a bit of well-tended garden, and generally a brilliant set of window plants. Then there is the dog. The miner's fondness for his dog is made a subject of many a jest, at which none laugh heartier than himself. Geordie is met on Sunday morning, trundling a wheelbarrow and looking the picture of misery. Questioned about his trouble, he replies that it is a crushing one. It is not that his favorite child is dead, nor that his wife is sick: these afflictions he could bear, but he has lost his dog, and in his terrible wretchedness he trundles out the wheelbarrow for company, for he says "a chap looks so fond wivvout his dawg." Since the miner has lost his work the canine companion has been missing, but not so long as there was a penny to pay for a license. Where all the dogs have gone to is a mystery only known to those great mystery-men, the makers of sausages and meat-pies. The miner is fond, too, of gambling. Fond, did we say? it is a passion, the strength of which cannot be estimated by dwellers in the southern counties. The newspapers which supply him with his politics had far better come out minus the latest news from Afghan than the latest sporting. In fair comparison London is nothing to Newcastle on a great boat-race day. Tyneside

may be starving, but it will find something to "put on" the race. Has not the reader heard of the dying pitman who was told by the clergyman that if he repented he would go to heaven and be an angel? "An will 'ia hev wings?" inquired Geordie. The parson replied in the affirmative, and in response to other inquiries went on to say that he himself would be an angel and have wings, whereupon Geordie proffered to bet that when they got to heaven he would fly his reverence for a sovereign. But all miners do not gamble nor are they always betting. Besides those who spend their spare time and money in the public house, or other sporting resorts, there are thousands connected with mechanics' institutes, temperance and religious societies, and other religious, moral and educational institutions. Nearly every villiage has its reading-room and institute, and several chapels. Already great advances have been made in the condition of our mining population. Nineteenth century influences for good are as potent around the coal pit as at the West End of London. Religion, temperance and virtue are gaining adherents by that power which is increasing everywhere the agencies of Christianity; here it may be the restoration of a cathedral, there the opening of a mission-room. The Education Act will entirely change succeeding generations. New forces are coming into play; the old order changes in the pit villiage as elsewhere.

"JERSEY DASH" AND "DASH,"—*New York, Dec. 19th. Editor Forest and Stream:*—In your report of the Eastern Field Trial you stated that "Jersey Dash," lemon and white setter, pedigree unknown, belonged to me. Mr. John Hen. Outwater, of Rutherford Park, N. J., is the happy owner of Jersey Dash, who is liver and white, not lemon and white. This dog is the sire of my Champion Jersey Duke, Jersey Hope, Jersey Dan, and several other good ones, and was entered by Mr. Outwater and myself merely to make an entry and show his remarkable constitution. He is nearly twelve years old, blind in one eye, and deaf as a post, yet he shows remarkable go and stay. He was never broken to field trial rules, but has been a rare good one, and has done some remarkable work even this fall. He is sired by Carroll's Jack, out of Neale's Old Jane, both pure and true native English setters.

Having lost my dark orange and white setter, Dash, on Nov. 16th, in West Hoboken, N. J., and not recovered him yet, I wish you would give this a place in your valuable paper, as a great many will mistake Jersey Dash for my old Dash, and be under the impression that I have recovered my dog. My Dash will be eight years old, but did not show his age; he is dark orange and white, upstanding light nose, hazel eyes, about three-quarter tail; and I should feel thankful to any one giving me information as to his whereabouts.

JUSTUS VON LENGERKE,
New York, Post-Office box 836.

GLADSTONE AND JOE, JR.—The long-talked-of match between Gladstone, owned by Mr. P. H. Bryson, of St. Louis, Mo., and Joe, Jr., owned by Mr. Geo. W. Campbell, of Columbia, Tenn., was contested near Florence, Ala., Monday and Tuesday of last week. Captain P. Henry, of Clarksville, and Major M. Williams, of Columbia, were the judges. Gladstone, about six weeks ago, had his tail broken; had not been in the field since that time, and was run the other day under protest. For this reason the trial was of two days instead of three, as originally agreed upon. The dogs were handled by their owners. On Monday the score was:—Gladstone, thirty points; Joe, Jr., thirty-four points. On Tuesday Joe, Jr., twenty-seven points; Gladstone, twenty-five points. Totals, Joe, Jr., sixty-one; Gladstone, fifty-two. Joe, Jr. was pretty well used up, having wrenched his left hind leg on rocky ground; Gladstone as fresh at the end as at the beginning.

A NEW IMPORTATION.—Mr. E. A. Herzberg received on Dec. 5th, per Inman Line steamer *City of Brussels*, from the kennel of Mr. J. R. Robinson, the lemon Belton pure Laverack setter dog, Flambeau.

NAMES CLAIMED.—*Monroe, N. C., Dec. 16th.*—I claim the names of Dick and Sancho for two pointer puppies, purchased for me by Mr. John Davidson, of Monroe, Mich. H. SMITH.

The name claimed by Mr. H. W. Livingston for his pointer puppy, by Rush, out of Rose, in last week's paper, should have been Jilt, instead of Gilt, as printed.

Mr. C. M. Bryant, of Boston, claims the following names for his puppies: Ruby II., for pup, lemon and white bitch, by Snap-shot, out of Ed. Orgill's Ruby; Light, for pup, lemon and white dog, by Snap-shot, out of Ed. Orgill's Rose.

Jack, for black dog pup, bred by G. A. Strong, West Meriden, Conn.

WHELPS.—The Montclair Hunt Club's (Montclair, N. J.) imported black, tan and white English beagle Equity, whelped Nov. 25th, five puppies, sired by imported beagle Rambler. Three puppies are marked black, tan and white; and two puppies, white, lemon and tan.

—Mr. C. H. Thomas, of Duxbury, Mass., has bred his Irish setter bitch Daisy to his Grouse.

—H. H. Turner, of Virginia, Ill., has sold his Druid, jr., Druid-Swayze pup, to Mr. H. H. Floyd, Abilene, Kan.

—"He, he, he," roared Myrrh Mills. "Ha, ha, ha," shouted Mr. Smith. "Ho, ho, ho," cried Hosea Brown.
"What a pair of feet the General has got for a go-as-you-please race," remarked Mr. Jones.
"Why?" demanded everybody.
"Cos," replied Joshua, "he would go the least ways and cover the most ground."

—King John of Abyssinia is very fond of firearms, and is an excellent shot,

Answers to Correspondents.

No Notice Taken of Anonymous Communications.

☞ *We make no charge for answering inquiries in this column.*

R. M. B., JR.—You will find Code Signals at Manning's office, 35 Beaver street, or at R. Merrill's Sons, 179 Water street.

J. W.—For Lyman's bow-facing rowing gear, address Geo. A. Lyman, Middletown, Conn.

C. M. B.—Merrill's Sons, 179 Water street, N. Y. Keep all the signal books, or can direct you.

S. M., New York.—For rigging canoes, see our back files. Cannot repeat here. Read the paper.

TONIC, Ohio.—Send your address to C. M. Hampson, Palestine, Texas. He wishes to correspond with you.

J. S. J.—Back "Yachtsman's Hollidays" not to be had in America. Order through book house. Price about $1.50.

A. B., Montreal.—We refer you to our last issue, in which you will see reference to Capt. McMurdo's spaniels.

L. M., Salem, Oregon.—You can obtain bull-pouts, catfish, and eels by applying to the U. S. Fishery Commission at Washington, D. C.

GROUSE, Oil City, Pa.—From your description your dog should command a good price, dogs well-broken on ruffed grouse being scarce.

A. L. D., Port Orange.—No American work on boat building published. We propose to publish something suitable ourselves shortly.

E. S. N., Springfield.—We can indorse Osgood's folding-boat. It is used by many sportsmen throughout the country with entire satisfaction.

H. L.—Illustrations of "sneak box" were published in a previous issue of this paper. See also Bishop's "Four Months in a Sneak Box."

G. F. W.—Your desires are praiseworthy and will be met in future issues. Ample material in hand. Yachts lines, etc., all in due time.

MERITABLE.—Why will a dog, that is treated like a prince at home, make a vag. of himself, half starved and miserable? Ans. Perhaps good old Dr. Watts would answer, "because it is his nature to."

W. W. W., Hazletown, Pa. The London *Field* is published at 346 Strand, London. It may be imported through the International News Co., Beekman street, New York. Price $12 per year.

R. M. S.—For very fine photos of yachts write to Black & Co., 333 Washington street, Boston. New York people do not know enough yet to photograph yachts for public sale.

J. M.—From practice it has been found that sail plans leased on the center of lateral resistance are perfectly reliable. This centre is taken as the geometrical centre of immersed fore-and-aft section.

H. DE F., Bridgeport.—If your boat is sound and modern in appearance without material faults in design, should say that $750 would be a fair asking price. Advertise her in our columns.

W. T. K.—Rubber is nothing now for boats. Many life rafts and "boiseas" are constructed of rubber cylinders blown up when needed with a hand bellows. Objections for ordinary boats are its weights, liability to crack, cut and rot.

SKIPPER.—We are awaiting further developments of the Yacht Racing Association. Afraid the movement has fallen into undesirable hands and is being made an advertising dodge of a precarious business venture. Watch our columns.

W. F. P., Boston.—Tell me where I can obtain the full directions for training a young setter dog on partridges, ducks and other small game? Ans. You had better buy a copy of Hallock's "Sportsman's Gazetteer," price $3. Can be sent from this office.

A. H. S., Binghamton.—We can not answer your questions intelligibly in this column. See files of FOREST AND STREAM, where the questions of weight, calibre, choke, etc., are fully discussed at length. If you expect to shoot many ducks, a 10-bore gun with one barrel choked would be most desirable.

S. A. McL., Bay City.—Models range from $50 up. See our advertisers. The cutter has what is called in America a "fore stay sail," and a jib set flying from deck on a bowsprit which can be "run in" in a seaway. Also has housing topmast, short lower-mast, long gaft and the mast steps about 42 per cent. of w. l. from the stem. See past issues.

AMATEUR, Detroit.—We do not like to recommend. Ask W. F. Whitman of your Metropolitan Police Department. A Gordon is preferred to an English setter by some persons. As between the two, it would be a matter of fancy. A dog is preferrable to a bitch as a house companion. You can treat both surgically, if desired, though not advisable.

C. H. D., Oil City, Pa.—Your setter pup shows most excellent training, and in that respect is superior to other setter pups of like hereditary qualities; otherwise there is nothing remarkable about him. One of the best ratters we ever saw was a big Newfoundland. So also, a dog of most any breed can be taught to do many things usually strange to his class.

SCATTER, Gambier, O.—Is it possible to make shot scatter by slightly moving the gun at the moment of discharge? Please state what kinds of game are under game protection in Ohio, and for how long? Ans. No, sir; hold your gun still—don't swing it. Quail, deer, grouse, and all kinds of game may be said to be out of season from Dec. 1st to Sept. 1st.

W. B. J.—Whether or not your "whale boat" is suitable for alteration into a steam launch depends upon whether you can get a shaft through aft. As the boat draws but little, would be best to drop the propeller below the keel entirly after the plan adopted in Herreshaff's torpedo boats. Consult with a local mechanic. Size of engine, about 4x4 inches, wheel 10 to 20 inches. Speed six to seven miles.

J. T. B. S.—Read Bishop's Voyage of the Paper Canoe, or correspond with him. In general the route will be through Raritan Canal, down Delaware Bay, through Sassafrass Canal into the Chesapeake, down that bay to Norfolf, thence by canal to Albermarle Sound, and with a few short runs at sea and through the Sea Island, reaches to St. Johns River, Florida, or further down the coast via. Indian River. See recent articles on Florida in this paper.

J. A. P., Peoria, Ill.—I have a fine Gordon dog that seems to have never fully recovered from distemper. The only trouble seems to be with his eyes. They discharge constantly, and have done so for the past six months. Have used a preparation on them that is not a permanent cure. It fixes them all right as long as I use it, but as soon as I stop the discharge again begins. It does not affect his eyesight at all as yet. He is otherwise in good condition and good spirits. Ans. Try a seton on the poll.

RANCHERO.—1. Is Oregon a good sheep raising country, and is it healthy? 2. What are the extremes of temperature in summer and winter? 3. Is there much rain or snow? 4. Is sheep raising profitable? 5. Is there a book published on sheep raising, and if so, where can it be had, and price? Ans. 1. Sheep raising is carried on to a considerable extent in portions of Oregon with profit. 2. The climate is generally equable, though the range of temperature is great. 3. The rainy seasons correspond with that of California, with considerable snow at intervals. 5. Many good books to be had of Orange Judd & Co.

M. P. T., Middletown, Pa.—My setter bitch has five pups five weeks old; four are well and lively, but the fifth is dull and lies around and groans as if in pain; it had a fit on Sunday and one on Monday, which lasted four or five minutes, each time frothing at the mouth and working its jaws all the time. I gave it a teaspoonful of castor oil and a few drops of worm medicine. All the pups pass thin, white worms, from one to three inches long. The pup's nose is cold, and it seems well in every way except the fits. Please let me know what to do? Ans. Your puppy undoubtedly has worms. If it is weaned, or if it will lap milk, give it one grain of santonine in milk for two or three days—fasting.

W. S. L., Methuen, Mass.—Enclosed please find a fish which I found floating in a pond in Windham, N. H. Will you please through your columns answer what name should be given to it? We often find them in pickerel taken from this pond, but never see them at any other time. By the marks on this one it looks as though it might have been killed by some pickerel or other fish. Ans. Your fish is the common gaspereau, or spring herring, *Pomolobus vernalis*. It is an anadromous fish, and there is no doubt an outlet from the pickerel pond to the sea, up which the large fish run in the spring when spawning.

E. B. G., Elmira, N. Y.—My spaniel dog has had internal canker of the ear for some time, and I have used remedies recommended by the FOREST AND STREAM, and by "Dinks, Mayhew and Hutchins on the Dog." The remedies would produce a cure for a week or so, and then the canker would reappear as bad as ever. I suppose his "blood is out of order," but I do not know what to give him. Ans. In addition to using the remedy for canker, give your dog internally five drops of Fowler's Solution of Arsenic twice a day, increasing to eight drops. Discontinue if his eyes begin to appear red.

T. T. P., Parisburg, Va.—1. The feet of my fox hound have been sore and swollen to nearly twice their natural size; she has been so affected for, perhaps, twelve months. Some parts of her are diseased. The hair comes off her face and head and the skin looks scaly. Is it mange? 2. Please tell where I may procure a fur glove pattern? 3. Are beagles good for foxes? 4. Who deals in second-hand guns? Ans. 1. Give your bitch Fowler's Solution of Arsenic, beginning with eight drops and increasing to twelve twice a day. The puppies have mange; a little crude petroleum well rubbed in, is the best remedy you can use. 2. Rip up an old glove. 3. Rather too slow. 4. H. C. Squires, No. 1 Cortlandt street, this city.

T. R., Washingtonville.—Unless you want the boat for a "sneak box" would advise twelve feet long, and sides twelve inches high. Bottom twenty-four inches wide, and top about thirty-two inches. The dimensions you send, ten feet by two feet by six inches, will give a displacement of sixty-five pounds to every inch of draft, consequently if loaded with 150 pounds it will draw about two and a half inches, leaving three and a half out of water. For ducking in smooth water this will be enough. You might even reduce the height at the ends to four inches, and deck all over except cockpit as proposed. Put four inch combing around hatch, and have rubber or canvas cover for lumpy water. Will publish details of "sneak box" shortly.

GROUSE, Duxbury, Mass.—1. Can you inform me where I can procure copy of Register containing names and pedigree of dogs entered in your Kennel Register? 2. What is the best browning mixture for barrels (waterproof)? Ans. 1. Send to J. N. Munson, St. Louis, for copy of Kennel Club Stud Book. 2. To brown your gun barrels: Tinct. of muriate of iron, one ounce; nitric ether, one ounce; sulphate of copper, four scruples; rain water, one pint. Plug barrels, using plug as handles. Clean with soap and water, cover with thick coat of slacked lime; remove when dry with iron wire scratch brush. Apply coat of above preparation with a rag. Let stand twenty-four hours; then immerse in boiling water and scratch with brush. Repeat until color suits. Then let them soak in lime water a short time. Don't touch barrels with your hand during the process.

ANIMALS AT PLAY.—Small birds chase each other about in play; but perhaps the conduct of the crane and the trumpeter is most extraordinary. The latter stands on one leg, hops about in the most eccentric manner, and throws somersaults. The Americans call it the mad bird on account of these singularities. Water birds, such as ducks and geese, dive after each other and clear the surface of the water with outstretched neck and flapping wings, throwing abundant spray around. Deer often engage in sham battle, or trial of strength, by twisting their horns together and pushing for the mastery.

All animals pretending violence in their play, stop short of exercising it; the dog takes the greater precaution not to injure by his bite; and the ourang-outang, in wrestling with his keeper, pretends to throw him, and makes feints of biting him. Some animals carry out in their play the semblance of catching their prey. Young cats, for instance, leap after every small and moving object, even to the leaves strewed by the autumn wind. They crouch and steal forward, ready for the spring, the body quivering and the tail vibrating with emotion; they bound on the moving leaf and again spring forward to another. Benger saw young jaguars and cougars playing with round substances, like kittens. Birds of the magpie kind are the analogues of monkeys, full of mischief, play and mimicry. There is a story of a tame magpie that was seen busily employed in a garden gathering pebbles, and with much solemnity and a studied air burying them in a hole made to receive a post. After dropping each stone it cried "cur-ack!" triumphantly, and set off for another. On examining the spot a poor toad was found in the hole, which the magpie was stoning for his amusement.—*From Passions of Animals.*

—There is a young man at St. Paul
Who tells stories exceedingly tall
Of his shooting. He shot,
At a secluded spot,
He says, seventy ducks with one ball.

FOREST AND STREAM AND ROD AND GUN

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

FOREST AND STREAM PUBLISHING COMPANY.

—AT—

No. 111 FULTON STREET, NEW YORK.

[POST OFFICE BOX 2832.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Advertising Rates.

Inside pages, nonpariel type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial column, 50 cents per line—eight words to the line, and twelve lines to one inch.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

***Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, DECEMBER 25, 1879.

To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith and be addressed to FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. Anonymous communications will not be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of mail service if money remited to us is lost.

☞ Trade supplied by American News Company.

A MERRY CHRISTMAS.—The winter season of joy and good-will is again at hand; and in something of the same spirit that brings the little feet pattering into your room this Christmas morning, and the blessed little forms clad in white to cry with cheery, childish voice: "Wish you Merry Christmas," the FOREST AND STREAM joins in the universal sentiments of kindliness, and extends its salutations to each and every one of its readers—to him who shall find his paper on the newstands this morning, and to him to whom in far-away Oregon our Merry Christmas shall come as an echo of the holidays.

DEATH OF GENIO C. SCOTT.—Our good old friend has passed away at the ripe age of seventy-three years, and hung up his rods forever! Let him rest in peace. With this ancient angler more than with any other, the writer has cast his lines; the reminiscences of full thirty years hang over his departure in a pleasant halo. Although long ill, he had been able to attend to his business almost to the day of demise. He was the publisher of fashion plates, having commenced in this city forty-five years ago. Angling literature was a passion with him, and he was a constant contributor of articles to the sporting papers, especially to the *Spirit of the Times*. In 1869 he published an illustrated volume entitled "Fishing in American Waters." In later life he was largely interested in mining operations in South America. He was a native of Livonia, New York. There are scores of anglers of the old school now living who will mourn his loss, although his genial presence has long been wanting in their social circles on account of his indisposition.

FINE ORANGES FROM SOUTH CAROLINA.—Our whilom correspondent, "Rusticus," Mr. Chas. G. Kendall, of Palmetto Island, near Port Royal, S. C., has this year received the premium for finest oranges exhibited at the Charleston Fair. Specimens, carefully picked especially for the holidays, with the glossy green leaves attached, may be seen at Lichtenstein's, 83 Barclay street. Mr. Kendall is a brother of Jos. H. Kendall, of Ogden & Kendall (New England Glass Company), this city. He is taking great pains with his groves, and we wish him every success in his Southern enterprise. His pen products are of as fine quality as his fruit. Orange culture at the South is growing to an immense business. A friend of ours in Florida recently saw a single train of seventeen car-loads.

—There are few men who drink at all, but who spend at least one-third they earn in liquors.

THE MISERIES OF CHRISTMAS.

START not, gentle reader, at the strange, and, as you may think, inappropriate title of this article, and let not your digestion, even by anticipation, be in the slightest degree disturbed by the glimpse I intend to give of the dark side of the picture, which no doubt you have always been accustomed to see painted in the most glowing colors. Do not imagine either that I wish to throw a damper over your spirits, or to restrain in the slightest degree your indulgence in those innocent festivities and rejoicings which from time immemorial have marked the advent of this great festival of the world.

And yet Christmas has its miseries as well as its joys; its troubles and cares as well as its mirth and happiness; and it is well that we should so consider it. Nor do we intend to descant upon the very poor, for after all in a city like this, where there are so many charities, and no fear of actual starvation, they are not really so much to be pitied at this season as the classes to which I shall presently refer.

The bluest beggar in the streets is sure to have some kind patron or patroness who will furnish him with his Christmas dinner without any anxiety on his part as to the means of procuring it. Nevertheless, on this, the threshold of the Natal day of Him who hath said, "The poor ye have always with ye," we must not forget to minister to their needs according to our means.

Nor do I refer to the inmates of the poorhouses and prisons, for they are sure of a good dinner, and enjoy it the more because of its rarity. Nor shall I describe the miseries of those who minister to our comforts and convenience at this blessed Christmas time—the railway employees of various kinds, the engine drivers and conductors, the pointsmen, signalmen, and porters—who must stick to their posts, Christmas or no Christmas. Nor shall I even claim sympathy for ourselves—"We slaves of the lamp"—who have catered for your intellectual appetites the live-long year, and now have to cudge an exhausted brains for some new idea wherewith to amuse or edify you.

It is not my intention to treat of any of these things, but to bring before your mind's eye, one or two classes of people to whom the advent of this joyous season is more or less a misery. And first I take the clerk or book-keeper, at a stated salary (and that a small one), and a large family of course. (Can any one tell why poor clerks and clergymen always have large families?) He has only a certain amount of cash which he can leisurely devote to the purchase of Christmas presents, and an uncertain amount of these to provide; there is no doubt about the number of expectants, however. There is Harry, to whom he has promised a pair of Forbes' acme skates, for taking so many marks at the high school, and there is Mary, who wants a work-box, and Tommy, a cricket-bat, and so on. And then there is little Susie, the youngest and the pet of the family. He well remembered how last Christmastide he had promised her a doll, with large blue eyes that opened and shut; and how his cash had run out, and he had to put her off with something else; and how his heart bled when he saw the look of disappointment on the sweet young face, and the pitiful quivering of the little lip, and the silent tear of infantile sorrow, trickling down the chubby cheek, and he mentally resolved, come what may, she should not again be disappointed. He had made up his mind to make his old overcoat do for the third winter; and yet with all his pinching and squeezing he cannot see how he can manage to satisfy them all. And so, night after night, as Christmas comes nearer, he tosses his uneasy head on his pillow, and when at last, at times he falls into a fitful sleep, he dreams he has solved a new arithmetical problem by which thirty dollars can be made to go as far as fifty, and he wakes with a start to find nothing "but the baseless fabric of a vision!" Think you, gentle reader, that Christmas has no misery for him?

And there is another class, whom we would little suspect of misery, but who yet are more deserving of pity than any other I know of, and to it belongs the man who has been living beyond his means—a merchant, perhaps, who has been struggling for years to maintain his credit and keep his head above water; who has (or thinks he has) to maintain a certain establishment in order to keep up appearances; who has an extravagant wife, to help him on the way to ruin; who is worried and harrassed by day and by night—carking care is the grim chamberlain that sits upon his pillow and greets him with the morning light. This man is expected to make splendid presents; his silly wife never ceases to ask him for money, and to remind him that she expects a gold bracelet or a handsome dress for her Christmas present. While she in her folly is thus adding to his troubles, sleep is driven from his eyelids by the thought of the notes which will fall due between Christmas and New Year, and of the consequences which will ensue if he fails to meet them. Does Christmas bring this man misery or joy, say you gentle reader?

And then there are what may be called the minor miseries of Christmas. There is the man with a heart larger than his purse, the enjoyment of whose Christmas is somewhat lessened by the thought that he has not been able to send a turkey or a goose to all the poor families he knows of. This class is rather rare, we must confess, just now, but still there are some of them in every place. I am too modest to claim to belong to it myself, but I have often thought, if I was rich enough, the height of enjoyment on a Christmas eve would be to fill my pockets with quarters and ten-cent pieces, and prowl outside pastry cooks' and candy shops, where half-starved ragged children, with their noses flattened against the glass, are feasting their greedy eyes (but not their stomachs) on the good things within, and envying their more favored brothers and sisters whose "lines have fallen in more pleasant places," and to slip a quarter into their half-frozen hands, and then, like the Arabs (not street Arabs, which they are) to "steal silently away."

Then there are the domestic miseries, such as those of the good housewife, whose mind is worried lest the turkey should not be done to a turn, or the pudding should not be boiled enough (for Henry is so particular), and she has her misgivings as to the capacity of Bridget; the new cook, who has the last day or two given symptoms of mental aberration, after mysterious visits to her own room, from whence, as she returned, there proceeded at the same time a strange smell of some foreign liquid, not unlike the favorite beverage of the immortal "Sairey Gamp."

I shall draw a charitable vail over those juvenile miseries which, as a natural sequence, follow an over indulgence in the good things of Christmas, lest visions of future doses of rhubarb and magnesia shall spoil the present enjoyment of the little ones, which God forbid!

And now I have reserved for the last what I consider the crowning misery of them all. I write feelingly, for I know how it is myself, and that is the misery of shopping for presents, *when you don't know what to get.* I need not explain that I mean the troubles of the male persuasion, for ladies, of course, are in their glory at this and every other season when there is any shopping to be done. I mean the poor unfortunate being who has no wife or other feminine with whom to take council, and who has to provide a present, say, for his intended. Who has not met some wretched specimen of this latter class—generally on Christmas Eve (for he puts off the evil hour as long as possible)—frantically rushing from shop to shop, taking into his confidence the shop girls, who, of course, will place before him the most expensive and useless articles, perspiring with anxiety, and muttering to himself in an agonised whisper, "*Oh, if I only knew what she would like?*" and finally, in the very recklessness of despair, buying the first thing that he can lay his hands upon, probably the most unsuitable he can get, whilst under his nose lies the very article which his Sarah Jane would give her eyes to possess. His misery would be still further increased were he an eye-witness of the way in which his gift is received, and could he see the contemptuous manner in which his beloved throws it down with the remark, "The stupid fool; he might have known I didn't want that!"

And now, having treated you, dear reader, to a dishful of misery, and having no wish to leave you in the "dismals," I will conclude with a plea for the *only* class who really, truly, unreservedly and entirely enjoy these happy Christmas times, and that is the little children. God bless them! What would this weary world be without them? Who would destroy their abiding faith in the unlimited resources of Santa Claus to furnish them with every beautiful thing their imagination can conceive? Who would dispel the illusion, sanctified by the tradition of ages, that this venerable and respected individual does really and truly, in corporeal presence, descend the chimney, and fill the expectant stockings with all manner of good things—bestowing his blessing upon the sleeping innocents the while?

Who does not love his childhood over again at this season in witnessing the joys of his children—reminding him of the long ago,

> "When life seemed formed of sunny years,
> And everything Hope whispered then
> My fancy deemed 'twas only true."

Then, whatever may be the consequence, let the little ones have their fill of fun and frolic, as well as of more substantial things. Let no restraint keep back the freedom of their mirth—let their joy be uncontrolled; for sorrow and trouble will come fast enough. Above all, let them understand that they are joyous and happy at this season because they celebrate the birthday of Him who was the children's friend, and who hath said, "Suffer little children to come unto Me, and forbid them not, for such is the Kingdom of Heaven."

—It is becoming the fashion, at distinguished weddings in Paris, for page boys to be substituted for bridesmaids. They are all dressed alike, mostly in red or blue velvet or satin, with silk stockings and gold buckles, and, for their business, have to attend on the bride, carry her prayer book and bouquet, support her train and veil, and generally be at her bidding all the day. Young brothers, or relatives under twelve years of age are usually selected for the office.

—Is the mock turtle a fraud?

MILITARY SKATERS.—Skating in the United States is almost wholly regarded as a sport, but in some countries, where the ice and snow season is more extended than ours, the skates are very important articles of personal outfit. In Norway there is an army corps of skaters, consisting of five companies of 110 men each, and this force can be further augmented by calling in the landwehr company of 270 skaters. These soldiers are armed with rifles and equipped with skates, which are six inches broad and from nine to ten inches long, being adapted for travelling over rough surfaces of ice and snow. The corps can be manœuvred with startling rapidity over the snow-fields. In ascending steep slopes the men take a zig-zag course, tacking up the mountain side as a ship does against a head wind. As an instance of the speed at which they can go, it is mentioned that last winter a messenger dispatched from Roeraas at 3 o'clock in the morning, arrived at Drontheim at 9.30 in the evening of the same day, having consequently accomplished 120 miles in 18½ hours. It must be added, however, that Roeraas lies some 2,000 feet higher than Drontheim, so that the course of the skater was down hill the whole way. On the return journey the same man took fifty-four hours to reach Roeraas from Drontheim, but the route he took led him over very rough and broken snow-fields, which rendered great caution and slow skating necessary.

VIRGINIA ROOT PIPES.—We have received from an old Virginia gentleman, an assortment of twenty or more smoking pipes made from sassafras, briar, and other roots, of the quaintest natural patterns imaginable. They can scarcely be said to be manufactured, the natural root being wholly retained in most cases, while in a few the most prominent protuberances have been sawed or whittled off. In the rough they represent almost everything in nature—birds, animals, and men's heads, limbs, etc. One of our collection is a perfect owl; another, a veritable skull; one a boot, and another an ancient Roman lamp. Some persons go so far as to trace resemblances and life-like portraits of living persons. And yet these are the indubitable roots, just as they are dug from the soil. Virginians, of the old school, use up about fifty of these in a year, so that somebody must be kept industriously digging to supply the demand.

The stems used with these pipes are an almost equally interesting study to those who have never seen the like. The titi is very much prized, but difficult to obtain of any length, as it is a vile, scrubby bush. Its limbs are knotted and twisted, and it seldom grows higher than eight feet, or more than three inches in diameter. It grows in swampy land, and on the banks of streams close to water. To obtain stems the main tree is cut down in winter, when it will put up from five to twenty sprouts from a foot to ten feet long. The pith in the sprouts is so small that perforation is very difficult. The bamboo root is also much in favor, and is found in considerable patches in parts of Virginia, especially upon the Paumaunkey. Hogs are very fond of it, and devour it when they can find it. The common cane is sometimes used for lack of better stems. The roots are converted into pipes by simply boring a gimlet-hole at right angles to a half inch augur-hole.

MEXICAN NATURAL HISTORY.—Mr. A. Gwyn Foster, nephew of the American minister at Mexico, is now engaged with his friend, A. W. Butler, in making collections for themselves in entomology, conchology, and ornithology of the country. Any person wishing to send them orders, can do so by addressing the above, at the City of Mexico, care of the United States Legation.

MULTNOMAH ROD AND GUN CLUB.—This is a club comprising the leading sportsmen of Portland, Oregon, to which the editor of this paper has recently had the honor of being added as an honorary member. We do not know that our feet will ever tread the Pacific slope, but our voice shall be heard as far off as Oregon, in the encouragement of field sports and the protection of game. We trust the Multnomah Club will have the fullest success in its laudable sports and undertakings. Its worthy Secretary is Will L. Chapman, who has been a long and frequent contributor to the columns of FOREST AND STREAM.

ANDREW JACKSON FOSTER.—There are scores of our readers who will recall the happy days spent in the company of this veteran guide of the Lake Megantic (P. Q.) region, and who will learn with sorrow of his death. The following particulars of that sad event are given in the Sherbrooke (P. Q.) *Gazette* of the 12th inst.:—

The sporting fraternity will learn with unfeigned sorrow of the untimely death of this old and faithful guide, whose name in connection with hunting, trapping and fishing topics in and around Lake Megantic is as familiar as household words. It appears that on Saturday night last he started on foot from Agnes, on the Chaudiere River, in company with a French Canadian, for his home in Marsden, near the head of the lake, taking with him a bundle of provisions, which he had strapped to his back. When nearly opposite a point on the lake known as Pamee, they proceeded to cross, and had accomplished about half the distance when the ice broke and they found themselves struggling in the water. The French Canadian managed to save himself by drawing himself up, but Mr. Foster was unable to do this, owing to the heavy pack on his back; and after a short and vain struggle he became exhausted and sank. His body was recovered on Monday afternoon. The deceased served in the commissariat department of the American army during the Mexican war in 1847. He leaves a wife in destitute circumstances in Island Pond, Vermont. We venture to say that very few of the large number of sportsmen who have visited Lake Megantic have failed to make themselves personally acquainted with this veteran guide, and it is those who have known him most intimately that will regret his loss. Those who may feel disposed to manifest their regret by contributing to the relief of his widow, can do so either by sending their contributions to this office, or to Mrs. A. J. Foster, Island Pond.

THE BEST CHRISTMAS PRESENT!—A receipted bill for the subscription price of the FOREST AND STREAM. The Forest and Stream Publishing Company employs a clerk to sign such receipts. The gift repeats itself fifty-two times every year.

— In another column will be found the interesting report of the Secretary of the Hamilton Cricket Club. This organization stands at the head of the list for 1879. If there was such a thing as cricket championship, the Hamilton Club would deserve the title of Champion.

GAME PROTECTION.

THE NEW HAMPSHIRE SYSTEM.—The advocates of game protection, who think that such protection is to be secured by the appointment of local game wardens, will find abundant food for reflection in the following account of how it works in New Hampshire. Despite its failure here, however, the system may still be urged as the correct one. Mr. Samuel Webber writes from Manchester:—

I see in your issue of the 11th instant an appeal to the Fish Commissioners of New Hampshire in regard to the spearing of trout in Lake Winnepesaukee, and wish to give you a simple statement of some facts, which should be understood in their bearings on this question. In the first place, the law which appointed the Fish Commissioners in this State, says nothing about the protection of indigenous fish, but authorizes the Fish Commissioners to restore salmon, shad, and other migratory fish to the waters of the State, and to introduce new and valuable varieties.

The same law authorizes the Commissioners to appoint fish wardens when the towns in the State have failed to do so. The statute, as amended in 1877, orders the towns to appoint such wardens, giving the Commissioners power to appoint, in case of failure by the town officers to attend to their duties.

The matter of protection is made the duty of the local authorities, and if they fail to attend to it, the Commissioners can only appoint wardens, who have full powers to prosecute for any infringement of the laws.

Now the Fish and Game Commissioners have appointed about twenty fish wardens in the towns bordering on Lake Winnepesaukee at the request of the inhabitants of these towns, and there the authority of the Board ceases.

If the wardens fail to attend to their duties we can remove them, but we have had no complaint from any of the towns interested. The first year the present Board entered on their duties the fish wardens around Lake Winnepesaukee sent in a batch of bills for services to the Governor and Council, equal to the whole expenses of the Commission, without having made an arrest or entered a complaint.

The Commissioners have refused to pay such bills, and the dwellers round the lake do not care to protect their own fish without the State will pay them for it, which the State does not propose to do. The penalties for violation of the laws are ample, and one-half of them go to the wardens or complainants, so that the the compensation is sufficient if the wardens attend to their duties.

Farther than this we have nothing to say, but wish it to be understood that we have done all in our power in regard to this matter.

AN ACTIVE ASSOCIATION.—*Boston, Dec. 20th.—Editor Forest and Stream*:—The following notice has been printed for distribution amongst our game dealers, hotel keepers and others likely to need the admonition. The Boston daily papers also will give place to the notice, and, we hope, with a recommendation that it be copied by the country papers throughout New England. The notice reads as follows:—

"The game laws of Massachusetts provide that between the first day of January and the first day of September, in each year, the possession, selling or buying of woodcock and ruffed grouse (commonly called partridge) is positively prohibited. The Massachusetts Fish and Game Protective Association hereby gives notice that all cases of infringement of this law which come to the notice of the Executive Committee of the association will be promptly prosecuted. EXECUTIVE COMMITTEE,
Massachusetts Fish and Game Protective Assoc'n.

We hope to convince the violators of our game laws that our Association does not exist for mere show, although in times past there has been a laxity of attention to the matter of game protection in this State, in fact, to an extent entirely inexcusable. In one or two counties we have a few deer. The law has nominally protected them for the past few years, and they have somewhat increased in numbers. Complaints have been frequent of late that certain parties have been slaughtering these deer, and from reports received, they have been very bold in their operations. The matter will be investigated, and steps taken to bring some of these offenders to justice. They should be made to realize that the penalty is one hundred dollars fine for each offence, and also a liability to be fined fifty dollars for using a dog in hunting deer.

JOHN FOTTLER, JR.

An example worthy of imitation.

The Rifle.

INTER-STATE GALLERY MATCH.—Mr. James S. Conlin, at his gallery, 1,222 Broadway, has arranged an Inter-State team tournament, the conditions of which make it open to teams of five men from any organized rifle club or military organization in the United States. Each team to have the privilege of re-entering twice. Original entry to be made at the gallery prior to 6th of January. One team to shoot each evening, and choice of evening to be drawn for by the captains. There are five team prizes: First, $55; second, $25; third, $15; fourth, $10. The fifth prize ($15) will be given to the team occupying the sixth position. Individual prizes: 1st. Twenty-five dollars for the best score made by any individual. 2d. Ten dollars for the man making the highest score on the lowest team. Any 22-100 calibre rifle of three pounds pull; seven shots per man, with the privilege of two sighting shots; Conlin's Ready Measurement target; other conditions, those of the N. R. A. The contest to be shot at Conlin's Gallery during the month of January. In case of ties in the aggregate, the teams or individuals tying to shoot off. All targets, immediately after being shot, to be locked up in a box, and there kept until all the competing teams have shot, when they are to be examined and counted by a committee of three, appointed by the captains of the competing teams, to decide the various positions of each team. All disputes that may arise shall be decided by a referee, appointed by the captains, whose decision shall be final. The competitions will commence on Jan. 12th, 1880.

DEATH OF M. MINIÉ.—A cable despatch announces the death, in Paris, of Claude Etienne Minié, the inventor of many and important improvements in fire-arms. Born in Paris about 1805, as soon as he was old enough M. Minié enlisted in the army, and served several campaigns in Algeria. Promoted to a captaincy of chasseurs, he devoted himself to inventing improvements that would perfect the service of the infantry. Favored with the special protection of the Duke of Montpensier, he was able to secure the adoption of various of his improvements, which affected the shape and make of balls, cartridges and gun-barrels. He was decorated in 1849, and in 1852 made chief of a battalion of horse. M. Minié refused to go to Russia and apply his inventions there, though offered still further promotion. He was long in charge of the shooting-gallery at the Normal School in Vincennes, and contributed largely to the perfection of portable arms. In 1858 he was called by the Pasha of Egypt to go to Cairo and direct the manufacture of arms and a school of shooting there.

—The rifle match for the Winchester champion medal will be shot at Captain Bogardus' Shooting School, Friday evening, Dec. 26th, at 8 P. M. This contest is open to all comers.

NEW YORK—*Jamestown, Dec. 13th.*—The "Gallery Rifle" tournament closed here last night for the Ballard rifle and three cash prizes, ten consecutive strings of five shots.

The following are the names and scores of prize winners:—

S. N. Ayres	24	21	24	24	25	23	22	24	24	25—241
Sami. Coe	22	24	23	22	23	21	22	23	23	22—227
Morris Southwick	21	24	23	22	22	21	21	23	22	23—224
E. J. Blakesley	23	20	23	22	23	22	21	22	24	23—221

The target used is Creedmoor 500 yards target, reduced for gallery; position off-hand, and the gun used .22 calibre; the score of Mr. Ayres being made with the Stevens gun, twenty-inch barrel. Messrs. D. W. Prosser and W. S. Kelso made scores of 234 and 222, but being members of the Sportsmen's Association were barred from all but the first prize. R. H. B.

OHIO—*Jefferson, Dec. 20th.*—Scores of Rifle Tournament; 40 rods; five shots each; 10-inch target; Creedmoor count; possible 25. Score of Tuesday:—

Game Bag and Gun.

GAME IN SEASON FOR DECEMBER.

Moose, *Alce Americana.*
Caribou, *Rangifer caribou.*
Elk or wapiti, *Cervus canadensis.*
Red or Va. deer, *C. virginianus.*
Squirrels, red, black and gray.
Hares, brown and gray.
Wild turkey, *Meleagris gallopavo.*
Pinnated grouse or prairie chickens, *Cupidonia cupido.*
Ruffed grouse or pheasant, *Bonasa umbellus.*
Quail or partridge, *Ortyx virginianus.*
Woodcock, *Philohela minor.*

Swans, Brant, Wild Ducks, Geese, &c.

☞This table does not apply to all the States. It is meant to represent the game which is generally in season at this time. State regulations may prohibit the killing of some species of game here mentioned.

CAPTAIN BOGARDUS' BIG SHOOT.

Captain Bogardus, on Saturday last, once more established his claim to be considered the champion shot of the world in his great match against time, skill, and endurance. The match was for a purse of $1,000 put up by Carl Dittmar, the powder manufacturer, who was willing to wager that amount that the great Captain could not, within the space of 450½ minutes, break 5,500 glass blass, to be sprung from Bogardus' Traps at eighteen yards rise—the shooter to handle his own gun, load for himself, using both barrels. To accomplish the work would require a continuous average of 100 balls broken in each eight minutes and ten seconds. This would be more than nine in ten shooters would care to try, and which very few indeed, outside of Captain Bogardus, would like to assure. The champion, however, had no fears about his accomplishment of the feat. Other big shooting attempts had made him able to stand an amount of pounding which would knock over half a dozen marksmen. The test was made at the new shooting school of the Captain's, No. 20 Eighth street. Dr. Bower Talbot was at the traps as puller, and performed his important duties with the regularity of a piece of clock-work. A single stock was used, and two sets of barrels. The 10-gauge pair used four drachms of Dittmar powder, and one and a half ounce of No. 8 shot, while the 12-gauge pair used three and one-half drachms of Dittmar powder, and one ounce of shot. The barrels were changed fifty-five times, and the excellence of the powder and the shells was shown in the fact that only three miss-fires occurred in 5,855 shots.

The start was made sharp at 3 o'clock, and was to have ended at 10.30½. According to a uniform rate of breaking, the following schedule should have obtained :—

Time. H. M.	*Number of Balls.*	*Time.* H. M.	*Number of Balls.*
1.41	500	4.47	5,000
1.22	1,000	5.28	4,500
2.03	1,500	6.09	4,500
2.44	2,000	6.50	5,000
3.25	2,500	7.30½	5,500
4.06	3,000		

The record of the match stood as follows :—

	Hundred.	*Time.* M. S.	*Misses.*	*Total Time.* H. M. S.
1st		5.00	2	
2d		5.13	1	.12 .12

			356	

John Ennis, the pedestrian, who is also a shooter of merit, acted as referee, and the score and time were kept by a representative of the FOREST AND STREAM, provided with an accurate time-piece supplied by N. M. Shepard, of No. 150 Fulton street, who stands A1 as a badge maker.

GUNSMITH WANTED.—A Washington, D. C, correspondent advises us that there is an excellent opening for a first-class gunsmith in that city. The right man who sets up shop there, and advertises his business in the FOREST AND STREAM, will find abundant work.

LOADING CHOKE-BORES WITH BUCKSHOT.—*Moina, Franklin Co., N. Y., Dec. 15th.*—I wish to thank R. W. H. for his article in the FOREST AND STREAM, of December 4th (and the FOREST AND STREAM for publishing the same), giving a description of his mode of loading choke-bores with buckshot; it is worth more to me than the price of the FOREST AND STREAM for a year. I like his plan of a concentrator for buckshot the best of any I have ever tried. It won't throw shot so far as Kay's or the Thread-wound, I suppose, but it will throw them to the spot or place you aim at, and do it as far as you will want to shoot one time in a dozen. Up here in the mountains, where most of the shooting is done over water before dogs, I have made many good shots with Kay's concentrators with buckshot, and have seen others make good ones with the Thread-wound. But my experience is (as the long-range rifle shooters say at Creedmoor), there are many unaccountables made with them, and they are not to be depended on, especially over water, where it is hard to judge the distance. For the benefit of sportsmen who have a breech-loader that suits them in all but its shooting qualities, I would say, don't dispose of it at a loss, but send it to some good gun-maker and get it rebored. Both barrels of my gun made too small a pattern to suit me; or rather, I wanted one to make a better one, so last spring I sent it to Wm. R. Schaefer, of Boston, to have the left barrel rebored. When the gun was returned, I could not see that he had touched it; but in coming to try it at a target, I found he had increased the pattern of the left barrel to double what it was before, and the penetration in like proportion. It will now average 425 pellets out of 1 ¼ oz., No. 8 shot, in a 30-inch circle at forty yards. It only cost me $5—expressage and all. I presume there are others who would do it fully as well as Mr. Schaefer; but his long-standing advertisement in FOREST AND STREAM saying, "Guns bored to shoot close and strong; warranted every time," is what decided me to employ him to do the job, and I now have a gun that suits me in every respect, which, at one time, I had about concluded to sell at a large discount from cost.

ADRION ONDACK.

HOLDING AHEAD.—*New York, Dec. 10th.*—In the different articles which have appeared in FOREST AND STREAM in regard to holding ahead in cross shots, a most important point has been constantly overlooked. It is evident to all that if a bird is flying from the point A to the point B, a certain length of time must elapse before the bird reaches B. Also, that a certain length of time must elapse before a charge of shot from the point C can reach B; and in order that the bird and the shot shall reach B at the same instant, the gun must be held far enough ahead so that the time required for the bird and the shot each to reach B at the same instant must be the same.

The different writers give their individual experience. Smith holds fifteen feet ahead on the same bird that Jones holds two feet ahead of, and here is the point; the difference is due to the different lengths of time used in pulling the trigger after taking sight, the muzzle of the gun at the time the shot leaves being in exactly the same place with both men. Smith holds his gun still, far ahead, and pulls at a definite moment which he has calculated. Jones follows the course of the bird with his gun, pulling the trigger in the meantime, and his charge of shot leaves at no definite moment; it is not necessary that it should, as the gun is held a little ahead all of the while, but far enough so that if the gun goes off at any moment while he is following, the bird will be struck. Jones' style is that of the large majority of the best shots.

None of the written descriptions will be of any value to the beginner, as the calculation of cross shots is all a matter of intuition gained by experience, and the crack shot no more stops to calculate time and place in shooting than he does in slipping his hand into his coat pocket.

MARK WEST.

THE FIRE ARM INSTINCT.—The instinct to handle a gun is as strong with some men as the instinct which leads them to eat when hungry. The child in the cradle stretches out its arms to grasp the munitions of the hunt. When Achilles hid away in girl's clothes among the daughters of his relative, the crafty Ulyssis appeared as a peddler with ribbons and silks and monogram garte rs and a set of arms besides. The girls, of course, took the finery, but the disguised prince revealed his sex by seizing the weapons, and was straightway marched off to the Plain of Troy.

There are men in whom the fire arm instinct is so strong that it refuses to be pent up by the conventional rules and artificial regulations of modern society. These men must have guns. John O'Connor was possessed of this instinct. The peculiar old piece which happened to be on exhibition in Necklin's old curiosity shop in the Bowery last Saturday, acted as a magnet upon John. The gun drew John to itself, and John drew the gun to himself, and proceeded to walk away with it. He was en route down Chatham street, bound for the wild plains of the West and the Utes, when a burly policeman took both man and gun into durance vile. The prisoner pleaded guilty, but urged that he had been twenty years on the frontier as a member of Captain Nugent's detachment. He had had his head shaved to prevent "the Indians from getting away with his scalp," but that did not save him from the sterner fate of being cast into the penitentiary for one month.

John is the victim of circumstances. With his taste for guns and half a million of dollars, the O'Connor collection of antique fire arms would be the most complete and valuable in the world.

THE WILLIAM MOORE GUN.—*Bucyrus, O., Dec. 8th.*—In your number of December 4th, I find an interesting article by "Au Sable," on guns. I read it with pleasure until I came to the paragraph condemning the guns of William Moore. That passage struck me with a chill, and I immediately wheeled myself around to my desk to write you a short article in defence of the worthy artisan thus condemned by "Au Sable."

I have a ten guage William Moore gun, of fine quality and well finished in every respect. I have owned it for fifteen years, during which I have used it on nearly all kinds of feathered game; geese, ducks, wild turkeys, quails, and prairie chickens, and always with the most satisfactory results. Its killing powers are extraordinary. I belong to a club that have good quarters, and large shooting territory at the head of Sandusky Bay, where we have abundance of open water ducks, such as canvas backs, red heads, blue bills, gadwalls, etc. With my Moore gun and number two shot, I have brought down the stately canvas back at as great a height as possible for any gun.

It was originally a muzzle-loader, made to my order, before breech-loaders had come into general use. I had it altered some five years ago by Charles Green, of Rochester, N. Y., and it holds high rank as a breech-loader at the present time. It is likely that William Moore is dead or out of business by this time. If alive, he is a man far advanced in years. He was an old man when my gun was made, but when in business his work was first-class. There is doubtless spurious trash in the American market, marked "William Moore." I have seen some of that kind myself that Moore never has anything to do with. They were not genuine English barrels. I took the pains to examine, and they lacked the official proof marks. A good man is the one whose name is selected by the forger to give credit to spurious commercial paper, by reason of the respectable name it bears.

William Moore was an apprentice under that prince of gun-makers, the celebrated Joseph Manton. He was afterwards his foreman, and succeeded him in business. As late as twelve years ago he was in business as senior member of the firm of William Moore & William Gray, 78 Edgeware Road, Marylebone, London.

In Porter's edition of "Hawker on Shooting," page 20, will be found a complimentary notice of the gentleman I am defending. Colonel Hawker, in commenting on London gun-makers, says: "Also, William Moore, who was an old hand at Joe's, and knew to a hair how to fit a man's shoulder with a gun. I have often stood over him when he was a journeyman, and no man better pleased me with a job. I always said: 'Depend on it, he will do well, and get to the top of the tree.' * * *

"'Billy Moore' is a right-hand man with the 'knobs,' or crack pigeon shooters, and their patronage is a host in itself towards a good lift in business."

In a foot note to a revised edition of his work, Colonel Hawker says, that Moore, in 1844, formed his partnership with Gray, and I have seen a letter from the firm written some twelve years ago.

In the London *Field* you will notice in the reports of pigeon matches it is customary to give the gun used by each shooter. I have noticed among the high toned shooters, such as lords and army officers, a fair representation of Moore's guns; I therefore infer that he is in good repute with those of high degree as well as with the "knobs."

With the foregoing facts before him, it will be in order for "Au Sable" to "arise and explain" after the manner of Truthful James,

S. R. H.

THE CLABROUGH GUNS.—*Stamford, N. Y., Dec. 8th.*—In your much valued paper I often read of guns of different makes, and how they shoot, but never saw anything about the Clabrough, save once. Now, I have had two Clabrough guns, both 12-bore. The first one had Damascus barrels, rebounding locks, and was equal in finish to a Scott which a friend of mine had that cost $225, and shot just as well in every particular, and weighed nine and three-quarter pounds. The second one is also Damascus of very fine quality, rebounding locks, top-snap action, patent fore-end, pistol grip, choke bore, seven and a half pounds weight, and is in every way a much better made and finished gun than the first. I have shot with guns of different makes, including a Scott of premier quality, and have never been beat on a thirty-inch circle at forty yards, and it shoots correspondingly well at longer distances. There are two more of the Clabrough guns owned here—very fine guns, and close, hard shooters, though not choke-bored, and will last a man a lifetime, if decently used.

About the durability of brass shells for shot guns, I will say I have used the Draper shell nearly four years, and they seem to be as good as new, perfectly sound and durable, and no accident of any kind has happened to anything by using them.

E. L. SEELEY.

TIGHT ACTION.—*Louville, Dec. 6th.*—In your paper of Dec. 4th your correspondent "R. W. H." speaks of his new Parker opening so hard, and wishes to know how to remedy it. I have had the same trouble with mine, and taking the action apart, discovered and quickly removed the cause—namely, a little feather edge upon the corners of the lifter that slides the bolt. Oiling the parts lightly, I put them together, and then the action worked perfectly, the weight of the gun being sufficient to open it. I have had no further trouble, and would not exchange it for any other make I have used.

H. W. HAYT.

FUN, BUT NO DUCKS.—Noticing the advertisement of Capt. Geo. W. Mitchell, of Havre de Grace, in FOREST AND STREAM, the writer, on the 2d of December, with a friend left for Havre de Grace for a day's shoot at the ducks. Visions of ducks in immense numbers floated through our brains, and in fancy we heard the whistle of their wings as they dart round the decoys. The night before starting, in dreams, we came off conquerors. How it turned out, and what we did, is the burden of my tale. Leaving Philadelphia at 4 P. M., we stopped over at Wilmington until 7, and then telegraphed to Capt. Mitchell that we were on the way. As we stepped from the train we were met by him and his men, to assist in carrying the traps—of which, with novices' ideas, we had an abundance—and which a load of ammuni-

tion made heavy enough. "Death to ducks," was our motto, you know. A short walk took us up to the landing, where we boarded the scow. As we were both accustomed to go on shooting expeditions (on land), and did not expect to find a floating palace in a ducker's scow, we were agreeably surprised to step into a neat little cabin, finished in hard wood, about ten feet long, as wide as the scow would admit, with good bunks arranged on the sides—ample room for us and all our traps. Capt. Mitchell said that from the appearance of the weather he feared we would not have a good day. Perfectly calm, the water lay smooth as a mirror.

Greenhorns, you know, like to see all that is going on, so, instead of going to sleep we sat up until time to start, and indeed, although nodding sometimes for a few minutes, we were wide enough awake when the time came for us to take our places in the double sink box. We had a breakfast good enough for sportsmen, consisting of coffee, beefsteak, and hot bread. We were in the sink boxes before it was fairly light, and occupied them all day, until too dark to see to shoot well. Killed but very few ducks, had a first class time. The Captain and his assistants did everything in their power to make the shoot successful, but, not being "clerks of the weather," it was not their fault that there was no breeze stirring. They did their part nobly, and we were content to pay their charge of $25, feeling that they had earned it in pulling the scow down and back, furnishing the meals, and the general good attendance. We did not expect our money's worth of ducks, but we had it full of fun, and next year, if nothing happens, we intend to get the same good man and crew for the whole of the first week. We found that our 12-bore choked guns, with the ordinary sporting loads, would kill the ducks every time if held on, and did not sigh for young cannon. I have written this to you, not for the sake of telling you anything new, but seeing the letter of J. S. H. in the last issue of FOREST AND STREAM AND ROD AND GUN, I want to let brother sportsmen know that an experience like that of J. H. S. does not fall to the lot of everyone who goes down to Havre de Grace, and to give the name of a good gunner that I think can be depended upon. I deem it a duty when sportsmen meet with ill-treatment to give the names of the parties, and when reliable men are found, likewise a duty to tell of it. Hence, think that J. S. H. would have done a good service had he given the name of the unfaithful man. BEN O'PENN.

Wilkes Barre, Pa., Dec. 20.

ALGONQUIN GUN CLUB.—*New York City, Dec. 19th.*—At the annual election of the Algonquin Gun Club the following gentlemen were elected for the ensuing year:—James Dunseith, President; Dr. Henry Griswold, Vice-President; Louis Brenner, Treasurer; Dr. Henry M. Burns, Secretary; J. Montgomery, Corresponding Secretary; Wm. B. Lundie, Referee. Executive Committee: David Simpson, J. H. Boessenecker, John Male.

LETTERS WITHOUT BATHOS.—We are pleased to see that our remarks last week upon this subject have found such a ready response among our friends, and it gives us especial pleasure to publish the following note from an old time correspondent, whose initials are familiar to our readers. Of the second cause of complaint, the bottle, we may only add that since we first, a year ago, demolished this unnecessary article of a camping outfit, it has been chiefly conspicuous for its absence in our columns:—

POUGHKEEPSIE, N. Y., *Dec. 19th.*

Editor Forest and Stream:—

I think your article in this week's paper on the "Forester School of Bathos," very timely, and such as will be appreciated by all sportsmen and readers—not of that "school"—and I trust it is not the last we shall have on that subject from yourself and others.

I doubt if there was ever any articles in any of the sportsmen's papers that were more heartily enjoyed than "Letters from Sportsmen," as published in the early numbers of ROD AND GUN. They were transcripts of actual experiences of the writers, with slight if any draft on the imagination. Coming thus from warm hearts they met a hearty appreciation from every lover of the ROD AND GUN.

Although my experience of haps and mishaps by "field and flood," has not been small, some account of which has appeared in the FOREST AND STREAM, I would not dare to present them to the readers of any sportsman's papers of the present time, as there is not enough of "gush" in my style of writing to warrant any hope of their meeting the approval of either critic or reader.

Another complaint I have to make is, that nearly all the "gush" writers insult most of their readers with their frequent and approving allusion to the use of stimulants under various names. To all such I say, beware! A sot's grave is in that path, as many have found.

With ruined homes, blasted hopes, and bloated forms all about us, who dare in any way, by pen or word, give the least sanction to a practice that may lead to such sad results.

The idea that intoxicating drinks are a necessity, either in camp, boat, or field, has been so thoroughly exploded by the experience of many, that it needs no argument to disprove it longer.

Sportsmen as a class are generous, free hearted, and jovial; and often when in camp indulge in practices they would avoid at home with their families; hence the need of caution at that point.

There is no better place, or mode of finding out any man's real disposition than camping out with him, where the restraints of home and society are thrown off. I think many a man has thus had a revelation of himself, to himself, that has surprised him.

One thing more, and my pen shall rest as in the past. I am glad you have devoted a liberal space to letters from our "sisters and our cousins and our aunts," yes, and wives, too. I am sure their influence will be for good.

J. H. D.

MASSACHUSETTS.—*Worcester, Dec. 16th.*—The open season for birds closes Jan. 1st with us, and our two clubs are making ready for weekly glass ball shoots. The Worcester Gun Club, the junior club of the two, has been busy the past month erecting a neat and very convenien club-house on its range, and on the above date the club, with friends and a delegation from the Sportsman's Club, dedicated the house with a glass ball shoot. Mr. William R. Schaefer, of Boston, was present as guest of President McAleer and the club. All present complimented the boys on their very fine grounds and house. The club was organized in June last, and includes lots of workers. Mr. L. R. Hudson, one of the oldest gunners in the city, is to shoot a glass ball match with Mr. S. Perry of fifty balls, on his return from Currituck, ducking. Mr. Perry to use his new Parker 20-bore, and Hudson a 10-bore Scott. Hudson and C. C. Houghton are now at Currituck, and several more Worcester sports are soon to follow. X.

Duxbury, Dec. 17th.—The past season has proved itself a good one, as regards game of the feathered tribe; blue-winged teal and rail, in large flocks, having passed us—something unknown for years. Woodcock came early, and remained very late, one being killed about a week ago. Quail quite plentiful, but very shy and hard to bag, they having made it a practice to tree when flushed. Partridges few and far between, owing, doubtless, to the ravages of the woodtick last year and foxes this. Rabbits can be found almost anywhere, and at any time. Several large bags of sea fowl (coots) have been reported from the Gurnet; ninety-eight, eighty-six and fifty-six being the largest single day's shoot. Geese moving along now daily; not inclined to stop, however. The bay is full of whistlers and shelldrake. GROUSE.

THE BEAVERKILL CLUB—*Secretary's Office, No. 99 Nassau street, New York, Dec. 23d.*—*Editor Forest and Stream*:—The annual report of the Beaverkill Club, which has just been sent to the members, is too long for you to print the whole of it, but the following items will probably be of interest to the readers of FOREST AND STREAM. Up in the Catskill Mountains, where our preserve lies, the thermometer was often down to 40 deg. in June and August, and 45 deg. in July; the average temperature for May was 60 deg., June 63 deg., July 71 deg. and August 69 deg. The club this year numbered fifteen, of whom only eight were able to go to the stream, but they caught in all 218 3-16 pounds of brook trout. These are wild trout, no pains are taken with them; they are not fed by us. They take what they can get in Balsam Lake and the headquarters of the Beaverkill, where there has never been saw mill nor tannery. We weigh and measure our trout, two of fourteen inches in length each weighed twelve ounces. Most fishermen, who do not submit their fish to the inexorable balances, would probably testify under oath that they are "experts," and that in their judgment and opinion a fourteen-inch trout would weigh at least two pounds; very many would say three pounds. But Beaverkill trout are not smaller than the average in the Eastern States (I leave out Maine), and they are delicious in taste, especially when a couple of the club stop about noon in the shade on the stream, and skilfully heap sticks and stones and light a fire, when they boil a pint of water, and make coffee in the French coffee-pot one has carried, and upon the wire oyster-boiler that the other takes from his creel strap, broil half a dozen of the purple and green mottled, crimson-dotted, delicate fish. A biscuit and a glass of sherry and a segar are all we need take along. Trout fresh from the stream are like green peas fresh from the garden. The Beaverkill club keep a warden on their part of the stream during the whole season. They have got an honest, capable man, and pay him well. The whole expense of the club during last season was $412 44c. We shall long regret the untimely death, last November, of kind, rosy-checked, tireless Mrs. Weaver, with whom we have heretofore boarded. "There my hostess ——, which, I may tell you, is both cleanly, and handsome, and civil, ——, hath dressed many a one for me. * * * and I warrant it good meat, '(*Walton*). GEO. W. VAN SICLEN.

LOUISIANA AND NEW JERSEY.—*Hillside, Stanley, N. J., Dec. 20th.*—*Editor Forest and Stream*:—A sharp contrast this, between the orange groves, rose gardens, strawberries in bloom and berry, mocking-birds, blackbirds, yellow-birds, wrens, teal, mallard, poule d'eau, red-heads, marionettes, wild turkeys and quail, of Louisiana and Mississippi; and leafless trees, songless birds, icy streams and snow-covered hills of Morris County!

Last Tuesday morning I left New Orleans for home, spending the day on the lovely plantation of my esteemed friend Fernando Gautier, Esq., at West* Pascagoula, Miss., fronting the rich and beautiful Pascagoula River. I had a few weeks before been the recipient of his genuine Southern hospitality, and in company with his son, Henry Gautier, enjoyed two days of glorious sport with the ducks in the ponds and bayous opening from the Pascagoula.

Although my experience with this variety of game has been somewhat extensive—bounded by the Rangeley Lakes, Saco Bay, Me., and Squam, Cape Ann, Mass., East, and Minnesota, West—I never before fully appreciated the term common to the majority of your veracious correspondents, when they use the word "countless." I cannot truthfully thus indicate the number of ducks that met our gaze, but I should require a week to execute the task.

And then the variety of species—many of them new to me. The one most abundant was called by Mr. Gautier *poule d'eau*. It resembled a devil diver, or dipper, in form; was about twice as large, and the color of a dusky coot. Another variety is called the black duck, but it was only two-thirds the size of our black duck, and much darker.

The most beautiful specimen I shot was a marionette, about a third smaller than a teal, with most delicate pencilling in grey and white on a dark ground. I selected a specimen of each, packed them nicely, and paid the expressage to New Orleans, addressing the package to Richard Rhodes, Esq., gunsmith. I attached an explicit letter of instruction, reciting that the enclosed were the first specimens of these ducks I had ever seen; therefore I wished them carefully mounted by a skillful taxerdermist. To prevent all possibility of error, I marked in large plain letters, on the outside of the package, "These ducks to be stuffed. Please send to taxidermist."

On my return to New Orleans I called on Mr. Rhodes, who, by the way, is a fine florid Englishman, with gray hair and full habit—indeed, a typical representative of the British soil. "Your ducks! Why, 'pon me soul, I had them stuffed, to be sure; but it was with onions, and at ma house! Was it that ye meant they were to be set up by a bird stuffer? Well, 'pon me soul, I didn't read your letter until after the birds were eaten, you know." Thus I lost my ducks, my expressage, and, most to be regretted, possibly, the knowledge as to what the correct name of these beautiful birds may have been.

I sincerely trust, Mr. Editor, my meagre description may enable you to inform me in a note appended to my communication.

My companion, Henry Gautier, Esq., a gentleman in every sense of the word, is a model sportsman, a fine shot, a successful angler. His greatest exploit happened last winter. He was still-hunting deer. They frequently are found within a mile of his residence. He came suddenly upon two. He got in one shot only as they ran. He was loaded with buckshot. One fell dead; the other ran two hundred yards, and dropped, mortally wounded.

A favorite amusement of Mr. Gautier's is to harpoon a dolphin in the Pascagoula River, and then, standing upright in his narrow piroque, be drawn at lightning speed over the water. Twice he has actually been drawn under, so rapidly did the great fish dart away after being struck.

In the first paragraph I alluded to the "songless birds" of Morris County. But that is partly correct to day. I was out for an hour this afternoon, giving my two youngest children their first sleigh ride, dragging them on their big brother's clipper sled, when the air was filled with sweet melody by a flock of the common yellow birds. They sang with all the vivacity of June. Indeed little Florence, our five-year old, insisted "they must have nests right up there in the trees!" As I saw and heard the same variety in Louisiana, it seemed very strange that any members of that family should have ventured to remain in the bleak, cold, icy North.

GEO. SHEPARD PAGE.

*Pascagoula is Indian, and means "Bread Eaters." Great quantities of the Indian yam were grown here. I procured some.

NEVADA—*New Boston, Nevada, Dec. 6th.*—I have recently returned from a hunting trip to Fish Lake Valley and the White Mountains. The latter was barren of results, as we were too late to hunt on the Summit (14,000 feet high), and too early for the snows which drive the game down into the cañons. We saw a few tracks of deer and mountain sheep, and some signs of dusky grouse, but no living game. In Fish Lake Valley, however, we had excellent shooting, giving me an opportunity to thoroughly test my new 12-gauge, 8 lbs., breech-loader. I brought to bag, 1 goose, 74 ducks, and 7 Wilson snipe. About half the ducks killed were a new variety to me; the ranchers call them the "Grey Russian." They were almost the color of a female mallard, the males only having a band of green across the wings. They were a little larger than a mallard, much more elegant in their form, and very much longer wings; their feet and legs were brown; very swift of wing, flying high over the pond, and dropping suddenly with a noise like a rushing wind. Are these the gadwall? They gave us sport of the very best description. There were four in the party, armed with new breech-loaders sent to us by your constant advertiser Henry C. Squires. We sent him an order for six, and every one gave the highest satisfaction; and if any sportsmen, living at a distance from any of our great centres of trade, wish for a new breech-loader, they cannot do better than to send their orders to Mr. Squires; and, my word for it, they will be fully satisfied. PENOBSCOT.

OREGON—*Salem, Dec. 1st.*—We have plenty of game here all seasons of the year; also good fishing, principally trout. I have discovered a plan by which the wads on the shot can be securely fastened. It is, after you have loaded and marked the shells, to take a brush and rub some dissolved gum arabic over the wad, so that the edges of the wad are stuck fast to the sides of the shell. It makes the charge solid, and I have used the paper shells as high as ten times without any inconvenience. I use a W. W. Greener, No. 13, breech-loader. On my last trial I killed nine snipe with ten shots, using three drachms powder, one ounce shot, No. 10, killing some at sixty yards. I have several kinds of dogs—spaniels, setters, double-nose pointers, shepherds, English and Scotch, black and tan, and fox terriers, etc. I am a fancier also of fine poultry, embracing twelve varieties, but do not make a livelihood by any of the above. L. M.

Portland, Dec. 9th.—Messrs. Bigbee, Church and Scroggies returned yesterday from a little skirmish down the river with fifty duck, several large geese, and a magnificent swan, which fell a victim to the prowess of Church. They report large numbers of swan and geese, but not a great many duck. MULTNOMAH.

CALIFORNIA—*Los Angeles, Dec. 1st.*—Quail are unusually numerous. Jack snipe, plover, and ducks just coming in. SHERIFF.

CENTRAL ILLINOIS ASSOCIATION.—The Central Illinois Association has a membership of more than twenty clubs. There is every promise that it will be an efficient body. Combination of forces ought to tell.

THE SONGLESS BIRD.—The sparrow comes from a good family, having a host of representatives in Europe, and a full list in North America; but, strange to say, it is the only scion of this large division of the bird tribe, from which the gift of song seems to have been entirely withheld. Everybody who has strolled in the country during May and June has listened to the sweet love carols of our chipping and song-sparrows, but no one ever heard the sparrow in question utter a single sound that possessed the faintest melody—nothing but that incessant complaining chirp and distressful chatter from one end of the year to the other—no intermission, no rest. If it could sing like the cat-bird, or even the clumsy robin, for instance, the opposition to it which exists would, it is safe to say, never have been aroused, because in all fairness, waiving the question of song, the sparrow cannot be any better or worse than the rest of its kind, which are all plump, sober, dull-plumaged birds.—*H. W. Elliot, in Harper's Magazine.*

—A country paper tells about a sportsmen's club's quiet shoot at glass balls. Now, if that club has found any way to have a gun go off without making a noise, w should be pleased to hear all about it.

Fur and Trapping.

FUR MARKET QUOTATIONS.

[Furnished by C. G. Gunther's Sons.]

Bear, Northern, according to size and quality, prime	$8.00 to	$12.00
Bear, Southern and Northern yearlings	5.00 to	8.00
Beaver, Northern, per skin, Parchment, according to size and color	4.50 to	6.50
Beaver, Western, according to size and color	3.00 to	5.00
Beaver, Southern, and ordinary, per skin, according to size	2.00 to	3.00
Badger	20 to	50
Cat, Wild, Northern and Eastern States, cased	50 to	60
Cat, Wild, Southern and Western	30 to	40
Cat, House, ordinary, if large	05 to	08
Cat, House, black, furred, according to color	25 to	50
Fisher, Northern and Eastern, according to size and color	5.00 to	8.00
Fisher, Pennsylvania, Ohio and Western, according to size and colors	3.00 to	5.00
Fisher, Southern, according to size and color	2.00 to	3.00
Fox, Silver, do	15.00 to	50.00
Fox, Cross, Northern and Eastern, do	2.50 to	3.50
Fox, Red, Northern and Eastern, do	1.10 to	1.15
Fox, Red, Southern Pennsylvania, New Jersey and Northern Ohio, do	75 to	1.00
Fox, Red, Southern and Western, do	50 to	75
Fox, Grey, Northern and Eastern, cased, do	75 to	75
Fox, Grey, Southern and Western, do	50 to	60
Fox, Grey, North and East, open, do	50 to	50
Fox, Grey, South and West, open, do	30 to	40
Fox, Kitt, do	30 to	40
Lynx, do	2.50 to	3.00
Martin, Stone, do	75 to	1.00
Mink, New York and New England, do	1.35 to	*1.50
Mink, Canada, do	1.00 to	1.25
Mink, Southern New York, New Jersey, Pennsylvania and Ohio, do	60 to	70
Mink, Maryland, Virginia, Kentucky, Indiana, Wisconsin and Iowa, do	40 to	50
Mink, Missouri and all Southern, do	30 to	40
Muskrat, Northern New York and Eastern, Spring	14 to	15
Muskrat, Western, including Pennsylvania & Ohio, Spring	10 to	12
Muskrat, Northern and Eastern, Fall and Winter	09 to	10
Muskrat, Pennsylvania and Ohio, Winter	08 to	09
Muskrat, Western, Winter	06 to	07
Muskrat, Southern, Prime, Winter	08 to	10
Muskrat, Southern, Winter and Fall	04 to	06
Muskrat, Kittens	02 to	03
Otter, Northern and Eastern, and Northwestern, according to size and color, Prime	6.00 to	8.00
Otter, Pennsylvania, New Jersey, Ohio and Western, do	04 to	05
Otter, Kentucky, Maryland, Virginia, Kansas and vicinity, do	3.00 to	4.00
Otter, North Carolina, do	2.00 to	3.00
Otter, South Carolina and Georgia, do	1.00 to	2.00
Opossum, Northern, cased, do	08 to	10
Opossum, Southern and open Northern, do	06 to	08
Raccoon, Michigan, Northern Indiana, Indian handled, dark, according to size and color, Prime	60 to	65
Raccoon, Illinois, Iowa, Wisconsin and Minnesota, do	30 to	40
Raccoon, New York and Eastern States and Northern Ohio, do	45 to	50
Raccoon, New Jersey, Pennsylvania, Indiana, Illinois, Missouri, Nebraska and Kansas, New Madrid, do	30 to	40
Raccoon, Maryland, Virginia, Kentucky and Tennessee, do	30 to	35
Raccoon, North and South Carolina, Georgia, Arkansas, Florida and Alabama, do	15 to	20
Rabbits, Prime cased	02 to	03
Skunks, prime black, I., cased	—	*1.00
Skunks, prime black, I., open	70 to	80
Skunks, prime † white streak, II., cased	60 to	65
Skunks, prime † white streak, II., open	35 to	40
Skunks, whole streaked, III. and IV	15 to	20
Skunks, scabs		01
Wolf skins, mountain, large, do	1.25 to	2.50
Wolf skins, prairie, average prime skins, do	75 to	1.00

* Skins to bring this price must be really fair sized, prime, dark and fine.

† Skins with only two finger marks of white on the head, we also call black.

Green skins are worth twelve cents less per skin than dried and well-stretched skins.

Woodchucks, squirrels, weasels and ordinary house cats are worthless.

N. B.—Above quotations are for all kinds of prime skins, according to size and color. Good size and good color, of course, command outside figures, and as much more or less as the market warrants us in paying when they come to hand.

SNOW-SHOE SLIPPERS.—*Mr. Editor*:—The receipt of a pair of snow-shoes from Quebec reminds me of your request for a reply to the letter quoted below, and I cheerfully reply through your columns, that every snow-shoer may know there is no longer occasion for one to be "a martyr to the toe-strap":—

DANESPORT MALLOW, COUNTY CORK, Ireland.

In FOREST AND STREAM for March 27, '79, page 146, Mr. Everett Smith speaks of snow-shoe slippers. How do they differ from the ordinary snow-shoe, low moccasin used with straps? and how are these slippers fastened and used?

Perhaps Mr. Smith would give a full explanation, and recieve the thanks of many a martyr to toe-strap and snow-shoe bar.

JOSEPH S. HUNT.

The "snow-shoe slipper" is in form similar to the forward half of an ordinary slipper. To this is attached a "heel-strap" that may be lengthened or shortened by means of buckles at the side of the foot. This slipper is fastened to the snow-shoe in such a manner that it plays with perfect freedom in the toe space, but cannot slip forward against the toe-bar of the snow-shoe, nor slip back so as not to turn in the toe space. Neither can it slip about to one side. Owing to this fact, very much fatigue is saved that is ordinarily caused by the lack of a firm footing. When the common toe-strap stretches it allows the foot to slip about so that the toe touches the bar when descending a hill, and on ascending one is obliged to curl down the toes, or literally "hang on by the toes" to prevent the foot slipping back on the snow-shoe; and this requires additional exertion, consequently additional fatigue. The slipper never allows the toe to press against the bar, nor does it allow the foot to slip back, and therefore enables one to "hold on" well when ascending or descending, and affords a firm footing at all times.

But the greatest of the many benefits derived by use of the slipper, is the freedom from foot-soreness afforded. The weight of the snow-shoe is so evenly distributed over the whole foot, instead of on a toe-strap, that the toes are no more subjected to chafing than when walking without snow-shoes on the ground. In addition to this immunity from chafing, the slipper protects the foot from blistering on the ball as well as serving as an additional covering to keep the foot warm and dry.

Unlike the toe-strap, which requires frequent adjustment (causing no little inconvenience, especially to novices and to ladies), the slipper is kept constantly fastened to the snow-shoe ready for use, and one needs only to press the foot into the slipper, tighten the heel-strap (which buckles), and the wearer is ready for an all-day tramp without any further adjustment, whether the walking be wet or dry. The snow-shoe is taken off by simply slipping the heel-strap down, thereby liberating the foot.

Another advantage of the slipper is, that one can use it without dressing especially for snow-shoeing. And although moccasins may be preferred, the slippers may be used equally well if one wears boots or overshoes. The ladies will appreciate this convenience, as well as the ease of adjusting them to the feet. Since the memory of living man the same method of fastening snow-shoes to the feet by means of toe-straps and thongs has been employed, and is still in general vogue. Great and permanent improvements have been made in the method of fastening skates to the feet, but none for snow-shoes until the one here described, which will undoubtedly be generally adopted when its merits are known. The drawbacks of snow-shoeing are numerous, and some of them serious, when the toe-strap is used. But as these drawbacks are overcome by use of the "snow-shoe slippers," long tramps may be taken day after day without rendering the snow-shoer footsore, and the combined comfort and convenience afforded by the slippers will serve to make snow-shoeing more popular as an amusement as well as giving relief to "martyrs to the toe-strap."

Although there may be no especial advantage to be gained on a beaten track in a race of a few hundred yards, yet for every other occasion, whether for a short or long tramp, and most especially the latter, the advantages and benefits of the "snow-shoe slipper" are most appreciable.

These slippers may be obtained in Portland, Me., U. S. A., and probably in any of the leading cities of Canada. They are manufactured by W. H. Parker. St. Elie, St. Maurice County, Province Quebec, Canada.

I will be pleased to procure them in Portland for any one who may wish them. I have worn one pair upwards of a thousand miles, and they appear to be serviceable for as much more use. EVERETT SMITH.

CLOGGING OF BEAR TRAPS.—In using steel traps for bears, it is necessary that the same be properly clogged, otherwise both trap and game will be often lost. A faulty but very common method is to fasten the end of the chain to the middle of a sapling five or six feet in length, which an old bear will sometimes pick up and walk away with; and, unless there is snow for a trail, it is good-bye to trap and bear. Again, such a clog, dragging at right angle to the trail is soon hung up in thick growth, when the bear in his rage and full strength will pound with the trap—if the chain is long—and break it, or the bones of the leg and twist it off, and frequently he goes to a tree, when he is only got by cutting it down thereby endangering the trap. Sometimes a grapnel is used instead of a clog, and with like results. For a proper clog, cut a tough, hard wood sapling, trimming off all limbs and forks several inches from the body, aiming to have as scraggy a tip as possible, with the whole length ten or twelve feet, and four inches diameter at the butt, to which, at the extreme end, attach the clevis with chain as short as possible. This will allow a bear to go straight away, seldom fouling, until he gives up exhausted. With such a clog he cannot tree, neither can he pick it up and walk successfully; added to this, there is a well-defined trail, the following of which is the height of enjoyment to the trapper. LORING.

IMPROVED TANNING PROCESS.—Dr. Chr. Heinzerling, A. M., of Frankfort, Germany, has invented and patented a new and improved tanning process, which produces better and more durable leather, and is from twenty to twenty-five per cent. less expensive than the old methods. The greatest advantage that it possesses over the old methods is that it requires but three to five days, instead of as many months.

The raw hides are unhaired and swelled in the ordinary manner, and are then placed in a solution of sour bichromate of potassa, or sour chromate of soda, or sour chromate of magnesia and alum, or sulphate of alumina and salt. They remain in this solution for a few days, according to the thickness and quality of the hides and the concentration of the solution. Instead of placing the hides directly in one of the above solutions, they can be first submitted to the action of a solution containing about ten per cent. of alum and some small pieces of zinc. By the action of the alum and the zinc, amorphous alumina (clay) is deposited upon the fibers of the hide, and prevents an injurious action of the strong solutions. If the hides have been in the above solutions of soda or alum for a certain time, a few per cent. of ferrocyanide or ferricyanide of potassa are added, which will prove to be very effective for the leather to be used for the uppers of shoes. They are then placed into a solution of chloride of barium or acetate of lead or soap for a few days, to fix the tanning substance. They are then dried and treated in the ordinary manner with fat or paraffine, or naphtha dissolved in benzine and similar substances, to which a small quantity of thymol or carbolic acid should be added.—*Deutsche Industrie Zeitung.*

LEARNING TAXIDERMY.—*Coralville, Johnson Co., Iowa. Dec. 3d.*—I was teasing my John to mount some birds by the instructions contained in "Sportsman's Gazetteer," when he suggested that perhaps I could mount them. Happy thought! I made the attempt and succeeded beyond all expectation. As I write, a green winged teal and a beautiful white throated quail are (apparently) looking down upon me. It is amusing to hear my friends remark, on seeing them, "Why, how very tame! Can't it fly? Will it peck me?" etc. It is delightful to give the life touches to the beautiful birds, arch the neck, and paint the eyes, etc., and I have repeatedly caught myself anxiously inquiring of my husband, "Can't you go hunting to-day? I should like some more birds to mount."

MRS. JOHN.

—We call attention to the advertisement of Mr. Joseph Parker. Mr. P. is the oldest importer of cricket material in the country, his house having been established in 1851; $5,000 would not cover the sales of last season.

Yachting and Boating.

ON DECK AGAIN.—We must ask the indulgence of numerous correspondents and contributors for delay in attending to their affairs, a somewhat extended cruise to the southward having prevented the immediate attention they deserve. With our barkie hauled out for winter, it will be fair sailing again in these columns. The huge pile of letters and missives which awaited our return was gratifying proof of the extended recognition FOREST AND STREAM has received as the leading yachting journal of America. It is our purpose in the future, should nothing unexpectedly interfere, to make these columns more attractive than before, by incorporating much that is of practical value to our readers.

TO YACHT BUILDERS.—An order is in the market for a sloop about 37 ft. on deck, 33 ft. water line, 14 ft. beam, 8 ft. deep. Model will be furnished. Usual construction, pine cabin, no spars or sails. If our city builders can offer figures low enough the work will be placed here. Apply at this office. Several other contracts are also to be placed through us.

THE HENRIETTE.—This steam yacht, the property of Mr. Henri Say, came to grief one hundred miles south of Cape Henry, by breaking her shaft. M. Say and family, with the guests, were transferred to a Norwegian bark bound for Baltimore, and the yacht made for Hampton Roads under sail. Whether the breaking of the shaft is due to poor forging, or is to be ascribed to one of those faults in the metal that it is impossible to prevent or detect in workmanship remains to be seen.

COLUMBIA YACHT CLUB.—*Editor Forest and Stream:—New York, Dec. 3d.*—At a regular meeting of the Columbia Yacht Club, held at their club-house on Tuesday evening, the following officers were elected for 1880:—Commodore, W. J. Greacen; Vice-Commodore, Emil Eberopacher; Recording Secretary, Chas. M. Armstrong; Financial Secretary, James D. DeGroot; Treasurer, George Runk; Measurer, M. J. Kelleher. For delegates to Yachting Association for 1880, John Frick, Abner B. Inglee, and Jos. A. Weaver. JOHN FRICK,
Secretary C. Y. C.

THE PAST YACHTING SEASON.

THIRD PAPER.

[SPECIALLY COMPILED FOR FOREST AND STREAM.]

ON the 28th two good clubs, the Atlantic of New York and the Eastern of Boston, held a joint regatta at New London, where their squadrons had met on a cruise. The rule was cruising trim, and there was some rare sport, the wind freshening up from the southwest and bringing up a sea that tried the qualities of sloops rather unpleasantly. It was fun for the big chaps, of course, and fun for the cutter *Enterprise*, though not quite as jolly for some of the single jibs. The cutter's performance was the most remarkable feature of the race; she beat *Winsome* and *Regina* easily, though she parted peak halyards, against which accident, however, must be set the picking up of a man apiece by the two sloops, which, spite of the vaunted superior safety of sloops in rough water, each managed to get a hand overboard, while the cutter, that according to "Podgers" should have been the distressed craft, carried her crew all right. Spite of her accident, *Winsome* was too much for *Regina*, which only took third place, *Schemer* getting in ahead of her. There were four first class schooners in the scrimmage—*Foam, Intrepid, Atalanta* and *Phantom*—and in the good breeze and steep sea, size and power told their tale, *Intrepid* rushing to the front and keeping the lead, till "crack!" went her bowsprit close to the stem, and crack! went all her chances of the prize, too, *Phantom* sailing uncommonly well, landing it for her owner. The second class schooners comprised *Agnes, Azalea* and *Peerless*; the latter split her jib, and was thrown out of the race, not, however, before she had given the Easterns a taste of her quality, after which *Agnes*, going in excellent form, took the stakes from *Azalea*.

The 4th of July being given up to pleasure, yacht racing was largely indulged in, and the Hub of the Universe had a city regatta, for which a veritable fleet had entered. The west-southwest breeze was sufficiently strong, as it turned out, to scare large numbers of "canvas-backs," and instead of 91 racing flags, 42 only were flung out; and who shall say that the "no, thank-you's" were not justified in keeping out of the fray, since every one is not fond of a plunge-bath? Considering the force of the breeze, the time made was not as good as one would expect from some theorists' accounts of what American sloops and schooners can do in a breeze of wind; but looked at from a practical point of view, it was very satisfactory, the thrash to windward being allowed for. *Thistle* lost her kites, and at the finish she ran into the committee steamer, much in the same manner that *Marina*, cutter, did some years ago when rounding the Mouse lightship. *Rebie* turned turtle, and *Thisbe* split her mainsail in a heavy jibe, while *Nonpariel* carried away her mast—a very fair total of mishaps. *Madcap* took the $50 first prize, offered for sloops over thirty-five feet in length, and *Breeze* the $50 for schooners, a protest against her by *Adrienne* having been settled in her favor. *Adrienne* did not manage to score, as both *Elfin* and *Fearless* beat her. In the second class, schooners, keel-sloops and centre-board sloops contended—*Hermes* defeating *Loiterer*, with whom she made a match of it, *Shadow* proving the best of the boards, and *Viking* adding another trophy to her stock by very easily getting away from *Hector, Gael, Annie* and *Empress*. In the third class, *Fannie*, centre-board, and *Sunbeam*, keel, netted $35 apiece as their record for coming in ahead, and *Fancy* and *Crescent*, among the mosquito centre-boards and

keels, took first prizes of $20. The city authorities were liberal in the way of prizes, offering over $500 in prizes, though had the value of the prizes been doubled, in the larger classes at least, the municipal recognition of yachting would have been more on a par with the importance of the sport. However, one must not look a gift horse in the mouth, and the Bostonians deserve thanks for their effort to get up a good regatta. Newport City was equally liberal, and there was some good racing there the same day, as well as at Salem, where a lot of the small fry congregated, and at the regatta of the Duxbury Yacht Club. The strong breeze, which blew pretty well everywhere, rendered reefing indispensable, and caused many upsets, half the fleet started at Riverton under the auspices of the New Jersey Yacht Club being capsized, and four yachts disabled and one capsized, being the record of the Beverly Yacht Club racing. At Ogdensburg, out of eight starters, five gave up and one capsized, only two—*Emma*, of Kingston, and *Peerless*, of Brockville—completing the course, the former, designed and built by Cuthbert, winning the prize. The Detroit Yacht Club had an exciting race among their first class boats, the schooner *Ives* having a day to suit her, winning, while *Ida* capsized and *Myrtle* very nearly foundered. In the second class, *Wayward* won easily, *Adelaide* shipping so much water that she could hardly get along.

The next event of importance was the regatta at Marblehead, of that splendid club, the Eastern, when ten schooners and five sloops—two of these modified cutters—came to the line. The wind was thicky from northwest, and lulled and freshened again during the race, in the course of which two yachts particularly distinguished themselves. *Fearless*, second-class schooner, and *Enterprise*, cutter, the former doing superb work, turning to windward and beating the two larger schooners in the first class that alone managed to get in ahead of her, by time allowance, much in the way that Count Batchquay's celebrated flyer, *Flying Cloud*, used to rub up her bigger sisters in schooner races. *Fearless* is certainly a rare good one, and the *Sylph's* crew, at least, must have opened their eyes when they saw Mr. Phillips' craft, which was nineteen minutes behind them at Davis' Ledge, not only come right up to, but actually pass them, take first prize and leave them the second only. *Enterprise*, which had given *Regina* and *Winsome* a drubbing sometime before, in a bit of a blow and a seaway, polished off the swift *Madcap*, with just as much ease in the smooth water and light breeze. The fight in the first class for schooners was between *Halcyon*, *Phantom*, *and Foam*, the first leading at the start, but finally having to yield the pride of place to her larger rival, who, nevertheless, could not beat time lost by allowance to Mr. Paine's vessel, *Sylph*, which, by the way, had pluckily entered at a greater length, sailed very well, and by a clever cast in shore, headed the whole fleet at Davis' Ledge buoy, though thereafter she was no match for fleet-footed *Fearless*. In the third schooner class and second sloop class, the racing was uninteresting, schooner *Dream* and sloop *Effie* making a clean bolt of it from the start and having the prizes safe all the way.

On the 11th of July, two days later, the Chicago Yacht Club had four races, *Cora* sailing over in the first, *Ina* winning off *Qui Vive*, and *Mamie* and *Anon* giving up in the second, while in the third and fourth *Nameless* and *Fleetwing* respectively defeated four competitors.

The Toledo Yacht Club, a new organization, held its first annual regatta on the 12th, with a light northerly wind to furnish the motive power to its four starters, *Stella*, *Idler*, *Red Ribbon*, and *Ada*, the former coming in first but losing on time to *Red Ribbon*.

There was a little too much wind on the 15th for some of the "ships" of the Buffalo Yacht Club, and out of seven starters three gave up. Mr. I. F. Ellsworth's sloop *Curlew*, won off *Fleetwing*, schooner, and *Arrow*, sloop, these two having a fine race with each other for second place, and *Corsair*, the biggest boat of the lot, being beaten by all three. The Duxbury Yacht Club held an open regatta the following day, when *Siren* beat *Lily* and *Triton* beat *Mercury*, the two former being centre-boards, and the two latter keel sloops.

Too little wind, on the other hand, favored the Royal Nova Scotia Yacht Squadron's two races on the 19th. The original fixture was for the 12th, a week earlier, but that day a fog of such portentious density and darkness covered Halifax Harbor, that it would have been positively dangerous to start the yachts in it. The 19th was clear but too calm, so that the race ended in something closely resembling a drift. *Daphne* led down wind, but the moment sheets were flattened, *Psyche* was by her, and the skipper of this craft tacking at the wrong time and stretching away in search of a better breeze, *Phantom*, very carefully handled, planted herself out in front, and won without difficulty. In the five ton race, two of the yachts entered withdrew, leaving *Muta* and *Vixen* to make a match of it; result: *Muta* first, *Vixen* nowhere.

I have omitted to refer to the Marblehead Yacht Club regatta, open to all, sailed on the 17th in a fresh northwest wind, that carried away the topmasts of two second class and two third class sloops, capsized one craft and nearly did the same to another, besides doing a lot of minor damage. There was a huge entry—one hundred and fifty names down, but discretion counselled seventy-eight owners not to risk themselves, their crews and their patent capsizing machines in the breeze then blowing. Still, seventy-two yachts, the majority of them open sailboats, started. The first class comprised four schooners—*Breeze*, *Adrienne*, *Vip* and *Unique*—which had met before. The first two sailed a fine race, *Breeze* winning eventually, but hard pressed by *Adrienne*, which has done very well in her first season, and should do better still next year, as is generally the case with racers. The *Unique* is, as her name implies, a model out of the common, something like the famous English yacht *Jullanar*, but does not seem to possess the speed of her prototype, that, though ugly to look at, is a good one to go. All that can be said of *Unique* is that she stood up to her canvas well. A new schooner, *Cyda*, owned by Mr. R. C. Bridge, and built by Keating, of Marblehead, won first prize in her class, beating *Loiterer*, *Annie* and *Mystic*. *Lillie*, minus her topmast, headed the second class centre-board sloops, and *Gael*, among the keels, satisfactorily accounted for *Lottie* and *Hector*, while *Posy*, *Hard Times*, *Hoiden* and *Inez* scored in their respective classes. More than a third of the starters gracefully withdrew from the contest before the races were over.

The New York Yacht Club squadron, while cruising, had a spirited race on the 18th of August, in blowy weather, which brought up a sea that, quite regardless of "Podgers'" feelings and his views as to the relative dryness of decks of American and British yachts, washed freely fore and aft the beamiest of the beamy, once they were close-hauled on a wind. *Phantom* and *Tidal Wave* were the first class schooners, but *Phantom* spoiled the race by starting too early—a remarkable circumstance in a race under the premier club's auspices—and getting disqualified. In the second class, *Clio*, *Peerless*, *Azalea* and *Magic* had a set-to, *Clio* sticking in front for a long time, but eventually succumbing to *Magic*, which weathered on her in style, took and kept the lead, and wound up by securing the prize. *Peerless* buried a good deal on the beat, taking lots of solid water aboard. *Niantic* and *Vision* were the first class sloops, and *Niantic* found it so pleasant to be ahead of her friend that she remained there all day. In the second class there were four competitors—*Vixen*, *Kate*, *America* and *Mistral*, and a very hollow race this proved; *Vixen*, going like a bird over the seas, fairly squandered her fleet, and won as she pleased, "hands down."

A few days before, on the 9th, that very active society, the San Francisco Yacht Club, had a rare good race, a new yacht, *Annheuser*, built to beat the crack *Consuelo*, making her first appearance, and fulfilling the purpose she was intended for. The third contestant, *Pearl*, split her centre-board. In the second class *Startled Fawn* carried away her topmast, and *Clara* beat *Frolic*, while *Lively*, *Zarifa* and *Magic* won in their respective classes.

During last winter and spring an immense deal of talking and writing was done about sharpies, which were pronounced by some enthusiastic admirers—and builders—superior to every other style of craft for every kind of work, though more moderate panegyrists contented themselves with claiming that this type was peculiarly adapted for use in certain waters. I rather think there was a sort of burlesque challenge issued by one of the sharpie men to sail his boat against the *Vindex*, if my memory does not play me false, in any weather, on condition only—and this is where the hidden joke came in, I suppose—that the match should be single-handed. After this geyser-like ebullition the sharpie excitement cooled down, and I looked carefully through the columns of FOREST AND STREAM for reports of the awful thrashing the new boats were to give the old ones—in vain, however, until one account did appear of a sharpie race on the Quinnipiac, on the 19th of August. And lo! the crack seaboats that do not "spank," carry shifting ballast, and have to to hoist it out to windward on planks to enable them to stand up to their canvas! There —rub it out—let the sharpie rejoin the many other illusions of the yachtsman in the land where steam catamarans outrun all other tea-kettles, and where "Podgers," in his saucer, rescues countless crews of capsized cutters.

Two day's racing at Charlotte, N. Y., on the 20th and 21st. The Oswego yacht *Ella*, and the well-known *Ida*, had a stand-up fight the first day for a $65 prize. *Ella* has been very much cracked up by her admirers and is reported a fast yacht; yet on this occasion, as on others, she was beaten. The next day saw five yachts engaged in a drifting match; they were *Florence*, of Sodus, *Mystery*, of Kingston, *Fiona*, of Whitby, *Phenix*, of Rochester, and *Rosalie*, of Charlotte. *Florence* being, apparently, like a craft I have had many a jolly sail in, "a devil to drift," got in first and secured the dollars. Is not a drifting match, *par parenthèse*, an awful nuisance? I shall never forget a six hours' spell at the tiller in a burning sun, and the faintest of faint airs. It was infinitely more wearisome than a trick twice as long when cruising in a dense fog off a dangerous shore, with only one spare hand to mind the sail and heave the lead.

It was aggravating in the extreme that the handicap race of the Eastern Yacht Club, on the 20th could not be completed in time, as *Foam*, *Rebecca*, *Enterprise*, *Madcap*, *Fearless*, *Latona*, *Romance*, and *Halcyon* met, and it would have been exceedingly interesting to compare their performances in a good breeze of wind. The *Sylph* and four others in the same class also started; but they were no luckier than the large boats, and the race had to be postponed until the fall regatta came off, and then the same misfortune happened. These are the drawbacks of yatchting, the thorns of the rose of racing. Well, we must grin and bear it.

What a day, on the other hand, the "Blue-Noses" had on the 23d, when the cup, presented by Mayor Tobin of Halifax to the Royal Nova Scotia Yacht Squadron, was won by *Sea Foam* in a regular hard blow that compelled schooners of the largest tonnage to dowse sail and run for shelter. There were eleven entries, all sloops except the winner, and seven started. The first gust, however, was too much for *Edith* and *Arizona*, and they suddenly gave up. That game five-tonner *Muta* fought it out some time longer, but the further she went the worse it got; and her helm was put up just in season to save her from foundering. The twenty-ton *Petrel* dived into the head seas so frightfully, and took such volumes of solid water aboard—contrary to all accepted notions of what beamy sloops do in such weather—that she also bore up for the smooter waters of the harbor, leaving *Sea Foam*, *Hebe*, and *Psyche* to have it out. Of course, there could be but one result to such a young gale as was roaring and *Seafoam* flew in a winner, *Hebe* and *Psyche* having sailed a splendid and plucky, though useless, stern race.

On the same day there was revelry at Swampscott, where the Beverly Yacht Club had brought together a perfect mob of yachts, having thrown open their races to all crafts not over 40 feet on water-line, with the result of getting 143 entries. Most happily for the sanity of the starters, the wind freshened up sufficiently to render it advisable for half a hundred of the "canvas-backs" to retire, so that it was possible to "accurately time" the ninety-four starters as they kept "crossing the line in a steady stream." It must have been awful! Eighty-two out of the ninety-four finished without sailing over each other, or swapping masts, sails, and crews "unbeknownst" to themselves, and for over an hour those unfortunate judges were timing the yachts at the finish. What nightmares they must have had; but then the affair was a success, creditable alike to the club capable of making such a show, and to the yachts engaged, inasmuch as "not a single protest was made, and not a serious accident occurred." Of course, it is out of the question attempting to describe the racing, or even to give the names of the eighteen winners of prizes in gold coin, the total amount reaching the sum of $285. Are not the names of the starters, and the appellations of their owners, and their port, and their length, and their rig, and their actual time, and their corrected time—are not all these, I say, written in the chronicles of the Kings of Judah—I mean in the columns of FOREST AND STREAM?

At the open regatta of the Buffalo Yacht Club, on the 26th, the Bermudian fashion of allowing the time for difference of tonnage at the start was tried, but how far the racers were satisfied with it I do not know. I would suggest to the club authorities to test, while they are experimenting on starts, the method devised by a lively Frenchman for equalizing yachts. It has the merit of allowing them all to be started together, yet insuring that the first home shall be absolutely the winner. It consists in each yacht towing behind her a hawser, length and size determined by rule, the large vessels, of course, towing a greater scope, and the smaller a lesser. I am not aware whether the inventor has succeeded in inducing any club to give his system a trial, but I perfectly remember that a hawser won't keep a fast yacht from winning off non-towing rivals. On the 4th of July, 1851, the Royal Thames Yacht Club sailed a schooner race, in a strong wind from southwest, from Rosherville round the Mouse and back. Three yachts started: *Galatea*, 124 tons, built in 1850 by Hansen, of Cowes, for Mr. T. Broadwood; *Alarm*, 248 tons, built by Inman in 1830 for that great yachtsman, Mr. I. Weld, who designed her, and subsequently designed "the old" *Arrow*, *Lulworth* the first and *Lulworth* the second; and *Albertine*, 156 tons, Lord Londesborough, also built by Inman, and a very fast vessel in those days. *Alarm* came in 19m. ahead of *Albertine*, and 36 ahead of *Galatea*, winning off the former by more than five minutes on corrected time. Some days afterwards she was hauled up at Cowes for a cleaning, and her owner, in a letter to a sporting magazine, stated that the spring used at the R. T. Y. C. match to cast her, was found to have got between her rudder and the stern post. "This spring," wrote Mr. Weld, "was 27 fathoms in length, and was made fast to the hawser she rode by, and in casting round at the start she broke this 6-inch hawser, which is thrown overboard at the time; but, it being made fast to the spring, she towed the whole away after her in the race. The spring was 3-inch rope, and was 27 fathoms long, the hawser 6-inch rope, and 24 fathoms long. The whole 51 fathoms she dragged not only in the race, but round to Southampton."

To return to Buffalo—a big jump from Cowes (no pun intended)—and the race. The yachts having started successively with a light breeze, the first class, comprising two schooners, *Hattie* and *Ives*, and two sloops, *Gannet* and *Cygnet*, gave the spectators a proof of the beauties o a luffing match, *Gannet* and *Ives* ramming each other up in the wind, and letting *Cygnet* slip by and take first prize. In the second class there were four schooners and two sloops, *Arrow* and *Fleetwing* meeting again, and the former landing the prize.

Having now got through the main events of August, I shall knock off and freshen the nip before filling away again on a Septeruber cruise.

ROUGE-CROIX.

YACHT DESIGN.

Editor Forest and Stream:—

I did not intend to reply to any comments made upon my article on yacht design. But your correspondent, "Deja Dugo," seems not to have understood anything I said, as shown in his article in FOREST AND STREAM of November 27th. What I said of the *Dauntless-Mohawk* race was not to indorse the *Mohawk* model, but just the reverse; and if I was mistaken as to the result of that race, it only goes to show the *Mohawk* a better boat than I took her to be. I have said distinctly in my article that I object to a flat boat with little ballast for a seagoing craft. I also object to the English cutter type, and think a medium the best. Then also your correspondent thinks I am mistaken in supposing the friction to be greater below the surface. That is something I said nothing about in my article, and so cannot be mistaken. Neither did I say anything about compressing water. Also, Mr. Editor, you, in your comments on my article, attributed to me as indorsing the idea of the greater density of the water below the surface, when I said nothing whatever about it. What I did say was, that it required more force to move the water a few inches at a considerable distance below the surface than it did to move it many feet at the surface, and cited proofs to that effect. Here is another principle in hydraulics in support of what I have said:—The pressure of water against whatever restrains its motion or holds it, increases as you descend from the surface. So with a vessel. Under her bottom the pressure per square inch of surface is much greater than at the surface, because of the weight of water above. As the pressure against the boat below is greater than at the surface, may not the friction be greater? Let some of the wiseacres answer.

DAVID KIRBY.

Rye, Nov. 30th.

Editor Forest and Stream:—

In commenting on Mr. Kirby's thoroughly sound opinions regarding "yacht design" the editor of FOREST AND STREAM remarks that "water, being incompressible, cannot be any thicker or denser below than near the surface, and offers no more resistance to passage through it than anywhere else," etc. I hardly think this statement should be allowed to go on record unchallenged.

It is true that water cannot practically be condensed, but water, like all fluids, has weight; weight causes pressure, and pressure must cause friction in proportion to the weight applied over or around any object, or portion thereof, being moved through the fluid.

If the upholders of deep keels, etc., doubt this to be a scientific fact, I would once again respectfully suggest that there is still a forty-foot boat, drawing eighteen inches of water, lying anchored here, and waiting for company around Long Island.

Roslyn, L. I., Nov. 24th. THOMAS CLAPHAM.

Editor Forest and Stream:—

"Defend me, therefore, Common Sense, say I, from reveries so airy, from the toil of dropping buckets into empty wells, and growing old in drawing nothing up."—COWPER.

In response to the remarks of Mr. Kirby, in your issue of the 13th, criticising a previous article of mine on "keel yachts," I hardly know what to say. That he is a man of great practical experience, no one will deny, and as such his lack of acquaintance

with the principles of hydrostatics, is, perhaps, not so surprising, for nothing seems harder to combine in this world than sound scientific knowledge and practical common sense.

The yachting community, as represented in print, is divided by this peculiarity into two great classes: those who know what they are talking about, and those who think they do; and it is this fact that makes me hesitate as to the manner of my reply, for with the former class some of Mr. Kirby's assertions with regard to resistance will have no weight alongside of the researches of Froude, Woolsey, Rankine and a host of others; while with the "practical," the fact that he carved *Arrow* with so much success will cause them to shut their eyes to his errors in explaining his successes, and they will accept from him anything he may say, however inconsistent with well-established principles.

I stated it as my opinion, and with all due respect to Mr. Kirby I still hold it—that a keel boat was, or could be, faster than a centre-boarder; and I think the performance of the *Enterprise* in the Greenport Regatta, 1879, in which she parted her peak halliards, lowered her mainsail, rove new ones, and still won, beating such boats as *Regina* and *Winsome*, sustains me in it; to say nothing of the *Viking* and *Gael* in the Boston races.

Brooklyn, Nov. 24th. MARTIN GALE.

Editor Forest and Stream:—

I have carefully read Mr. Kirby's article on yacht design, and taken all together, think it is the most able article that has appeared in your payer since I have taken it (February, 1879). Mr. Kirby thinks a large amount of ballast is necessary to speed in working to windward in a seaway, and compares it to the balance wheel of machinery. Now, a balance wheel is not put in an engine to increase the speed or power, as it is well known that a heavy balance wheel is a loss of power, caused by the extra friction, and is only used where steady motion is necessary. Now, the yacht with a large amount of ballast will displace a greater amount of water than one with less, consequently she will have more wet surface, which will cause more resistance by the extra friction. In regard to your comments on Mr. Kirby's statement, that the resistance is greater at a depth than at the surface being incorrect, I think it is very plain that the resistance is very much greater ten feet below than at the surface. As water weighs something over 62 pounds per cubic foot, the pressure at that depth is equal to its weight, therefore the pressure of ten feet would be 620 pounds per square foot. I do not claim that water is practically any denser below than at the surface, but as the pressure is greater, the friction of wet surface must be largely increased. POLARIS.

Buffalo, Nov. 26th.

In order to close this discussion, so far as we are concerned, we now add that our esteemed correspondents, Mr. David Kirby, Thos. Clapham, "Polaris," as well as many others whose letters we cannot print, are in error concerning greater friction being produced at twenty-five feet draft than at five feet. Authority: The exhaustive experiments instituted by Mr. Froude, which prove *practically* (no theory in this) that, in spite of any supposition to the contrary, friction is *not* greater per unit of surface at deep draught than at light draft. We prefer to take the practical deductions of Mr. Froude as our authority, to any vague guessing of correspondents, however highly we may think of their accomplishments in modeling fine and fast yachts.

To Mr. Kirby we desire to say, that water being incompressible, a cubic foot of water, at twenty feet depth, will flow around a vessel's hull as easily as a cubic foot at five feet depth; and friction, the other factor of resistance, barring wave-making, being no greater, it follows that at twenty feet no greater resistance will be experienced to passage than at five feet, always assuming that the vessel's form is sufficiently fine not to *lift* the column opposing it, but to permit its passing into the wake. Draft in vessels of fine form has nothing to do with resistance. "Polaris" is reminded that large displacement unless abnormal, does not necessarily imply large wetted surface. It would be an easy thing to design a vessel with 25 per cent. more displacement and yet less "skin" than another.

As our esteemed friend Mr. Clapham is something of an enthusiast for practice, he will not in this case object to our taking Mr. Froude's practice in preference to his own theory.

We would suggest to some of our readers, that the perusal of a work on physics would do much to give them a clearer conception of the statical and dynamical properties of fluids, a confounding of which is at the bottom of much of the misconception existing concerning resistance of vessels under way. But if we can spare the space, it is proposed to publish a series of short papers on the whole subject of naval design, so that a clearer understanding can be arrived at than from any further discursive remarks in answer to individual correspondents.

Rational Pastimes.

THE GAME OF CRICKET.

—Mr. George Wright is still suffering from the injury to this hand, sustained in Daft's Nottinghamshire vs. Yorkshire match, at Philadelphia. Several bones were broken, and Mr. W. says, "Morely did it."

—The Newark (N. J.) Cricket Club is talking of giving a public entertainment for the benefit of the organization. One of the principal features to be the All-Muggleton and Dingley Dell match.

AN AMERICAN TEAM TO VISIT ENGLAND.—It looks very much, as matters are shaping, both here and across the water, as if there was a prospect of a Philadelphia team visiting England sometime during the coming season. At a recent meeting of the Young America Club the following resolution was unanimously adopted:—"That, with a view to returning the visits of foreign cricketing elevens to Philadelphia, and in the belief that such would materially add to the further development and future benefit of cricket amongst us, Mr. George M. Newhall be requested and authorized, on behalf of the club, to make such arrangements as he deemed best, if any, looking to a visit abroad during the coming season of a representative team of Philadelphia cricketers; and also, that the Secretary be instructed to open correspondence with the other Philadelphia clubs in regard to the matter."

YOUNG AMERICA CRICKET CLUB.—At the annual meeting of this organization, held at Germantown, Philadelphia, on November 19th, 1879, the twenty-fourth anniversary of the club, the following Board of Directors were elected to serve for the ensuing year:—Edward M. Davis, Jr., President; Robert Vaux, Vice-President; D. S. Newhall (235 Church street, Philadelphia), Secretary; Edward J. H. Howell, Treasurer; George M. Newhall, H. Pinckney, and Rodman Wister. More than seventy members were present, and there was much enthusiasm over the annual reports, election of officers, and the prospect for the coming season. There are now on the roll 4 honorary, 23 contributing, 310 active and 82 junior members; total, 419. The financial condition of the club is excellent.

MERION CRICKET CLUB.—On Dec. 5th the regular meeting of this club was held at the Merchants' Club, Philadelphia. The following officers were elected for a term of one year:—James Rawle, President; Meredith Bailey, Vice-President; Edward S. Sayres) 217 South Third street, Philadelphia), Secretary; and William R. Philler, Treasurer; Ground Committee, Richard H. Reilly, Lindley Haines, J. Randall Williams, J. S. Waln and Joseph M. Fox. On adjournment of the meeting the members sat down to their annual club dinner, as has been the custom for many years.

—Do not neglect to oil your bats, from time to time, during the winter months.

AVERAGES FOR 1879.

UNIVERSITY OF PENNSYLVANIA.

This Philadelphia University played three matches, of which one was won, one lost, and one drawn on account of rain. The small number of matches played was principally due to the very busy inter-club season, and to an unwillingness to contest with older and more powerful local organizations. This, therefore, left them only Columbia and Haverford Colleges against which to match themselves. Next season the University trusts to be able to present an eleven which will be strong enough to successfully compete with the larger clubs, in which case it will be able to arrange plenty of matches for the spring and summer months. Harvard, too, is to have an eleven, and several of the Western colleges have already stepped into the arena; so that altogether the outlook is a good one for inter-collegiate cricket. At present the University has no second eleven to boast of, which is to be regretted, as the second is generally the future strength of a college club. The classes played a number of matches with each other, and besides the University Eleven averages, the principal of these will also be found annexed:—

BATTING AVERAGES.

Through the courtesy of the secretary of the University Club, we furnish the above interesting official report.

HAMILTON CRICKET CLUB.

The annual meeting of the Hamilton Cricket Club, of Hamilton, Ont., was held on November 3d, George Roach, Esq., President, being in the chair. After the minutes of the last annual meeting were read and confirmed, A. H. Hope, Esq., Treasurer, read the financial statement, which showed the expenditure to be $554.93 and the revenue $419.93, the amount now due by the club to be $393. The treasurer explained that the deficit was due to the visit of Daft's Team, the total expense connected with it being about $930.00. The greater portion of this had been provided by private subscription. The subscriptions during the year had increased by $100, but the expenses had been unusually large. It was decided to raise the amount of the deficiency by supscription among the members of the club, and a handsome sum was subscribed by those present. The question of having a professional was discussed, those present being generally in favor of it.

The Secretary, Alex. Harvey, Jr., Esq., read his resumé of the season's play, showing that the club had played ten first eleven matches exclusive of the one against Daft's team, and only lost one, viz., against the Irishmen. Two junior matches were also played, of which one was won, and one lost. The following is the Secretary's report:—

SECRETARY'S OFFICIAL REPORT OF THE HAMILTON CRICKET CLUB FOR THE SEASON OF 1879.

The season was opened by a match played in St. Catharines on the 24th of May, against the club of that place. We had had scarcely any practice previous to this, and the team, with one or two exceptions, was a weak one; nevertheless we proved victorious by 27 runs. Hamilton, first innings, 34; second innings, 109. St. Catharines, first innings, 41; second innings, 75. The top score was 49, obtained by Mr. Simonds.

The next match was played on our ground, on the 26th of May, against the Paris Team, which resulted in favor of Hamilton by ten wickets. Paris, first innings, 56; second innings, 67. Hamilton, first innings, 116; second innings, 5, for no wickets. The highest score was made by Elmslie, 36.

On the 14th of June a match was played on the Hamilton Grounds against Galt, when Hamilton scored another victory by eight wickets. Galt, first innings, 21; second innings, 80. Hamilton, first innings, 49; second innings, 55, for three wickets. Davies obtained 23 (not out), the highest score; Park next, with a well played 20. The bowling of Ferrie was remarkably good in the first innings, he getting eight wickets for 10 runs.

The next match was played on the Trinity College Grounds, Toronto, on the 27th of June, against the ex and present students of Trinity College, which was easily won by Hamilton by an innings and 38 runs. Trinity College, first innings, 31; second innings, 50. Hamilton, first innings, 119. The principal feature of this match was the brilliant innings of Mr. Simonds, who got 68 (not out). This was the top score of the match and the highest individual score of the season.

Next came one of the most important matches of the year, namely, that against the Peninsulars, of Detroit, played upon our grounds on the 1st of July. The Peninsulars brought their strongest team, and I think that the Hamilton Club never put a more efficient eleven in the field than upon this occasion. The match was well contested throughout and resulted in our favor by 18 runs on the first innings. Detroit, first innings, 73; second innings, 23; for five wickets. Hamilton, first innings, 96. We were, doubtless, indebted for this very important victory to the magnificent wicket-keeping of Mr. Waud. In this match, as in all other matches in which he participated, his play behind the wickets was almost perfect, and we can congratulate ourselves upon having in our eleven the best wicket-keeper on this side of the water. The fielding and bowling all round in this match was good. The highest score was again obtained by Simonds, 22.

The next match was played against the Carlton Club, on the Toronto Ground, on the 26th of July, and resulted in the signal defeat of the Carltons by one innings and 12 runs. Carltons, first innings, 20; second innings, 61 Hamilton, first innings, 93. Simonds again headed the list with a score of 26.

We next found ourselves playing in Hoboken against the old-established St. George's Club, of New York, on the 25th and 26th of August. The weather was most unfavorable for cricket, and owing to a heavy fall of rain we were unable to have any play the second day, consequently the match was declared drawn, although greatly in our favor. St. George's first innings, 47; Hamilton's first innings, 99, for two wickets down, of which Ray obtained 29, Simonds made 24, and R. K. Hope 21, both not out.

From New York we proceeded to Philadelphia, to tackle the famous Young Americans of that place. The match was played on the beautiful new grounds at Stenton, on the 27th and 28th of August. The weather was fine, but the ground rather soft. The Hamilton captain having, as usual, won the toss, the Young Americans went first to the bat. Their innings closed for the remarkably small score of 28, being about the smallest total their eleven has ever put together. Ferrie's bowling in this innings was admirable, and seemed greatly to surprise our opponents. He got seven wickets at the expense of only five runs. Hamilton, in their first innings, made 74, of which A. H. Hope got 24, and Simonds 22. Great things were expected from the Young Americans in their second venture, but they barely succeeded in avoiding a defeat in one innings, making only 50 runs, and leaving Hamilton 5 to make to win, which was done without the loss of a wicket. Thus we won our greatest victory by 10 wickets. We have heard since that the Young Americans took the result very much to heart, and that they intend to have their revenge next year, if they have to come here every week. It is to be hoped they'll come often.

We left Philadelphia on the evening of the 28th, and made our way to Staten Island, where, on the 29th and 30th, we engaged in a match with the club of that place, when we were again fortunate enough to prove victorious. We defeated the Staten Islanders by 8 wickets. Staten Island, first innings, 47; second innings, 43. Hamilton, first innings, 66; second innings, 25 for two wickets. Simonds got 16, and R. K. Hope 15 in the first innings, and in the second innings, Waud played well for 11, not out. Kennedy bowled extremely well throughout this match.

We left for home on Monday, Sept. 1st, taking with us a clean record, and, I think, the good opinion of all the cricketers with whom we came in contact. It is expected that these three clubs of our tour will visit us next year to play the return matches, when it will devolve upon us to endeavour, to the best of our ability, to return in some manner the hospitality so liberally extended to us by the cricketers of New York, Philadelphia and Staten Island.

The next and last club match was that played on the 13th and 14th of Oct. against the Irish Gentlemen, when we met with our first and only defeat of the season,

Owing to our batting being sadly weak, we were beaten by 60 runs. Our fielding, with the exception of one or two errors, was perfect. Rylott, the professional who accompanied the Irish Gentlemen, and who is engaged at Lord's Ground, stating that for five years he had never witnessed better fielding. The Hamilton bowling was also good, Gillespie particularly distinguishing himself.

During the season two Junior matches were played, one on the 21st of June against the W. C. College, which was won by Hamilton by one innings and 24 runs; and one played on the 7th of Oct. against the Ancaster Club, when the Juniors were defeated by 10 wickets.

On the 18th, 19th and 20th of September a match was played on the Hamilton Ground between Daft's professional team and seventeen Canadians, when the latter were defeated by one innings and 103 runs.

In the batting averages for the season, Simonds heads the list, with the very good average of 27.36. His average is over twice that of any other member of the team, and is about five runs over the average obtained by the gentlemen players in England during the past year. In the bowling Ferrie comes first, with an average of 4.07 runs per wicket, which is an exceedingly good average, and very creditable. Gillespie and Kennedy have also very good average.

On the whole we've had a most successful season. We have been well captained, and have pulled well together; can show a record such as no other Canadian club could ever put forward. We have unquestionably earned, as the New York papers stated, the Club championship of America for the season of 1879. The following are the averages, both batting and bowling, for the season :—

BATTING AVERAGES.

Names.	*Innings.*	*Runs.*	*Most in an Innings.*	*Most in a Match.*	*Times not out.*	*Average.*
H. C. Simonds	14	201	68*	68*	3	27.36

ARCHERY.

ARCHERY SCORING.

Editor Forest and Stream:—

For myself and many fellow-archers of this region I desire to say a few words concerning Mr. A. S. Brownell's theory that the archer's target would be more equitably valued if the consecutive rings counted from 1 to 5 for the gold, instead of from 1 to 9 as it is.

As I understand it, the "mark" is the spot or line at which we aim. The "gold" is the mark in archery. We all aim at it. We must not even think of any red or blue or black if we would hit the gold. If we set up a "clout" of 9.6 inches diameter, the best man makes the most hits on an average. Our English ancestors in the days of the Field of the Cloth of Gold, shot at small white discs or at peeled willow wands; for excellence was so universal that no archer would invite the reputation of inferiority by asking that any shot four inches from the center be made note of. Archers then scored on hits only.

But we modern worshippers and practicers of this royal sport require some recognition of approximate excellence; and so we surround our mark by a broad circular margin whereon to measure the distance by which our less skilful shots miss the mark; and this margin is, for convenience, divided into rings of rapidly decreasing value, for it is not the mark or a part of the mark, and its value is justly small and rapidly lessens as we approach the edge. If a gold be fastened to a large upright surface, say a clay bank, where the brick-makers have left it smooth and perpendicular, and concentric rings of a regulation target be scratched in faint lines about the gold, it is as good a target as any of straw and gaily-painted canvas; for the mark is there, and misses can be given their comparative values as certainly as upon a $4.50 target.

As I view it, this circular margin, with its rings of diminishing value, is in effect a concession by first-class archers to archers of lower grades of skill; and we should accept it as such, magnifying the gold by giving it a far superior value. Let us by no means subtract from the enthusiastic veneration in which all true archers hold the gold by lowering it nearly to the level of a no hit.

As for the two or three instances mentioned by Mr. Brownell, I answer that the question must be argued on averages and not upon an occasional wild round, or unusual score where the hits are low in proportion to points made. Let us suppose a case parallel with the one mentioned by Mr. Brownell as occurring at Beacon Park last September. One archer has during a month's practice scored a few points more at each round than a rival, but his rival has also at each round scored more hits. I claim the first is a better archer than the second, and should outrank him, for he has demonstrated his greater power of concentration by averaging his arrows nearer the mark, though his fewer hits may show the power is not continuously with him. On the other hand, if his rival had equal power of concentration, his nerves were not so steady or his muscles so strong and obedient as those of the first, as his greater varying from the mark proves. So be detected by their odor, which somewhat resembles I say the first is the better man, both in Mr. Brownell's case and in my hypothetical case; for isn't archery, as taught by our honored father, Maurice Thompson, and exemplified by him, and that perfect archer, his brother, a test of manhood?

So I say, let the scoring remain as our English cousins have arranged it. Let us keep the gold far above the circles of mediocrity, and rob it of none of its fascination by bringing it nearer to them. Perfection is our aim; so let us keep a premium on perfection by retaining the superior values. MASSASOIT BOWMAN.

Springfield, Mass., Dec. 11th.

AMERICAN BOWS ONCE MORE.

NEW YORK, *Dec.*, 1879.

Editor Forest and Stream:—

In your issue of November 13th is a letter from Mr. Thomas Aldred, of London, Eng., in which he complains of an "attack unwarrantably made upon me by two of your correspondents, 'Archer,' and Mr. John W. Sutton." Now, for my part, I had no idea of making an "attack" upon Mr. Aldred, but I was criticising "Toxopholite's" statements from my standpoint, and Mr. Aldred's bows was the subject of "Toxopholite's" letters in praise, and American bows in the opposite, and there was, from my standpoint, a lot of nonsense in said letters, such as, "You can talk of your American bows, but it is preposterous to put them against such a maker as Thomas Aldred, who has been making archery since the year 1813;"—"and I say there is no maker in this country that is prepared to-day with stock ahead to make bows that will answer the requirements." Mr. Aldred says, about that comical five years' seasoning statement, "The wood must be gradually and naturally seasoned by a current of air constantly passing through the drying or seasoning rooms, and the *bows advanced by sundry stages year by year*"—(the italics are mine). Now, in the name of common sense, is seasoning timber anything but drying; and can it possibly take years to dry a piece of timber of any kind of the size of a bow, say, one inch by one and a quarter inches? This is a matter that it does not take a bow-maker to decide; anybody that will give it a moment's thought, will see that this talk of "years" is "bosh," and nothing else. A piece of wood of that size, left in the air (covered from the wet), in the summer will be thoroughly dry in a few months in this country. It may take a little longer in the damp climate of England, but not years. A piece of timber is thoroughly seasoned whenever the water in it is exactly the same as is in the same bulk of the surrounding air, and, as there is no chemical change going on in the wood, the day that the wood is in that condition, it will make as good a bow as if it was kept years; and if no decay occurs in the wood, it will be no better, no worse. Seasoning timber is no novelty; and is as well understood in this country as in any other, and that bow that takes "sundry stages year by year" is no better than if it had been made up the week the wood was dry. Mr. Aldred says: "And so limited are the *good* bow-makers, that I can count them on my fingers." As Mr. Aldred has only ten fingers, and has been in the business since 1813, he no doubt knows them all. I wonder what will the other English bow-makers say to that, as there are nearly that number that are in the trade. Are their workmen all second, or third, or fourth, or some other rate, or is Mr. Aldred mistaken? My idea is, that almost any good mechanic can make a good bow; and I get this idea from seeing any quantity of good bows made by their owners, many of them not mechanics, but amateurs, that not only shoot well, but have stood usage that the imported bows break under every day. There is hardly a village of 4,000 inhabitants in this country where such a bow cannot be found in use. I happen to know one here, a snakewood, that the owner made over twenty years ago, that has been in constant use ever since it was made, and it holds its own against all comers. This must show to every one, not badly prejudiced, that bow-making is not one of the fine arts, nor does it require any more skill than thousands of other things that are made every day without any glory.

About copying one of Mr. Aldred's yew bows: Of two sticks of wood exactly alike in every way, one was made into a bow by Aldred, and Brother Jonathan takes the other stick, and by careful measurement makes it exactly like the first one; will there be any difference in the bows, and will that "archer" be able to tell which is which? if so, how will he do it; can it be explained in simple English? There is no magic in bow making—it is a very simple affair, and it is only a trick of the trade to claim anything else, and the thousands of amateur made bows prove this.

No doubt the reason the English bows fail in this country is the difference in the temperature and humidity of the two countries. A bow seasoned in the air in England for years will be no drier than the surrounding air, and when brought here must dry out a portion of the water to be the same as our very much warmer and dryer atmosphere. English seasoning is not American seasoning—even years of it. Yew bows are said to be the best bows in the world. They certainly should be, or there is a lot of money wasted; but how much better? Will a yew bow shoot five or ten or twenty per cent. farther than a lance wood or some other cheaper bow? Who knows? Are they stronger, and if so, what per cent. stronger? Can any body answer in understandable language? If a bow costing, say, $10, and a yew $50 or $75 or $100, how much farther will the yew cast an arrow, or how much lower will the tragectory be in feet and inches? This is a question of considerable importance, and I suppose every archer in this country would like an answer that was not guess work or boasting. There is finish and all that, that counts, but bows are for use, and if a $10 bow will throw an arrow within five per cent of tragectory of a $50 or $75 yew, is the percentage worth that much more money, especially as the evidence is very strong that one is as liable to break as the other? Now, is not that "break" question of more consequence than the five per cent., or some other per cent., unless quite large. A broken $75 bow is no better than a broken 75 cent one, and the loss is very much more.

Aldred denies that he refused to string his very costly bow without pay, &c. Well, I think a gentlemen of this city can tell another story. As a bow-maker let me ask: Why should not we warrant our goods as well as any other manufacturers? Everybody else does; gun-makers, carriage-makers, and I do not know any one that does not. If I make a bow I know whether it is of good tough wood, if it bends true and all about it. Now, why should my customer be forced to take that bow and pay for it, and take all the risk? Are bows anything but springs, and does not every spring-maker warrant his work? I propose to warrant my make of bows against any reasonable usage, and do not fear to let any archer have a bow with that condition. With this business idea, when I heard that fine bows could not be strung without the customer taking the risk, I felt thankful that I could make an unbreakable bow that I think is second to none in its shooting powers, and at a price that would not require the buyer to own much New York Central stock to purchase.

The close of my letter sticks in Mr. Aldred's crop:—"American mechanics are superior to any others in the world, and having begun the making of bows and arrows, will not stop until they supply the world with a better article for a less price, not excepting Mr. Aldred."

Let's see if I cannot make that good. I am making rawhide-backed bows, and I sell them for $10, and warrant them unbreakable, and am willing to have them strung and used by anybody anywhere, and so firm in the faith am I that they are "superior" to any bow made by Mr. Aldred at the same price, that, if he wishes, we will each of us put one hundred dollars in the hands of the editor of FOREST AND STREAM to purchase a cup to be given the winners of two out of three trials with our bows. Each of us to bring a six-foot 45lb. bow—that is, a bow that, when the string is twenty-six inches from the inside of the bow, shall pull 45lbs.; the bows both to be of the kind and class sold in this city by myself and Mr. Aldred's agents for $10. The trials to be:—

First—To pull the longest arrow thirty times, the last time the arrow to be held in place one minute.

Second—Three arrows at 100 yards for the lowest trajectory, the height to be measured 60 or 70 yards from the shooter's stand.

Third—Three arrows at flight shooting. Each to use in the two last trials any length or weight of arrows they may choose. The winners to take both bows, as well as the cup.

As I do not make a bow of over $15, and Mr. Aldred makes some very high priced ones, if he will give me say five per cent. discount on every time his price exceeds mine—that is, a $20 bow will give me five per cent., a $30 bow ten per cent., and so on—I will be willing he should use any bow he may choose. If I use a $15 bow, then the percentage to be the same on that price. Certainly, if double price is only five per cent. better, one might question where the money was well spent. As our winter is at hand, the match to come off as soon as the weather will permit in the spring. But I am not particular as to that. Mr. Aldred may set the time.

95 *Liberty street.* JOHN W. SUTTON.

NEW YORK ARCHERY CLUB.—The New York Archery Club has secured quarters for its winter practice at Excelsior Hall, corner of Twenty-seventh street and Ninth avenue. Last Saturday the members shot for the club colors. Targets were arranged at the west end of the hall, which was banked with butts made of burlaps and filled with excelsior. The ladies shot at the first target and the gentlemen at the second. Between the two parties great rivalry existed, as well as between the individual members. Ninety arrows were fired at a distance of thirty yards. The ladies' badge was won by Mrs. Dr. De Luna, with a score of 252, while the gentlemen's was won by Mr. Breeze, with 496 to his credit.

MANHATTAN ARCHERS.—At a special business meeting of the Manhattan Archers the following regular board of officers was elected to take the place of the temporary board which was elected on Oct. 11th, 1879, to hold until a permanent board be elected: President, W. C. Beecher, 237 Broadway; Vice-President, Dr. M. McLean, 304 East One Hundred and Twentieth street; Secretary, Robert Lawrence, 37 Pine street; Treasurer, S. E. French, Metropolitan Hotel. Executive Committee, J. O. Davidson, Fordham; Geo. W. Folsom, 46 West Thirty-seventh street; Dr. M. McLean, 304, East One Hundred and Twentieth street; S. E. French, Metropolitan Hotel.

ROBT. LAWRENCE, Sec.

KANSAS ARCHERY.—*Lawrence, Kan., Dec. 15th.*—Below I give the highest score I have made at the American Round since the Chicago meeting:—

40 Yards.	*50 Yards.*	*60 Yards.*	*Total— Hits.*	*Points.*
30—200	27—100	29—118	86	418

Mr. Chester, of the "Commodus Archers," has fitted up an indoor range for winter practice, and I give you the highest score made by three archers at the indoor range. Distance, 35½ yards:—

	Points.
E. P. Chester	183
F. O. Marvin	190
J. D. Patterson	205

Mr. Marvin commenced shooting in September of the present year. J. D. PATTERSON.

ORITANI ARCHERS.—*New York, Dec. 15th.*—The Oritani Archers have sent a challenge to each of the following clubs, viz.: Brooklyn Archery Club, Robin Hood Archers, Manhattan Archers and New York Archery Club. They wish to shoot the American Round with a team of six. It is to be hoped that a friendly match can be arranged before the weather gets too cold. Mount Morris Park would be a first-rate place for such a match.

ARCHER.

CORTLAND ARCHERY CLUB.—The Cortland (N. Y.) Archery Club has been organized with the following officers: A. Mahan, President; Dr. F. O. Hyatt, Vice-President; C. F. Straat, Secretary; Mrs. G. H. Arnold, Treasurer. A hall will be secured for winter practice.

STEEL BOWS.—Our mechanics have not yet made for us a good and, at the same time low-priced bow. The good bows are too expensive, and the low-priced bows, considering their quality, are also too expensive. All are fragile and easily broken. Why does not some enterprising manufacturer experiment with steel? It seems as though, with steel, a bow could be made that would possess all the qualities of a perfect yew bow, and yet not cost more than a tenth as much. The bow

might be made of flat strips of steel, thin enough to be sufficiently elastic; and these strips could be laid one on another so as to give the requisite strength. S. TEEL.

Women's Column.

BEAVER DAM, Wis., *Dec. 16th.*

Dear Girls:—It is quite time that Rebecca came to the front; being as I am the oldest, I know that it is expected of me. Our houses have all undergone a general airing, and now that winter has fairly set in, we must at once be about our business. If Mehitable was only here we would set back the chairs and "tidy up" immediately. But dear me; the good old-fashioned girls have gone entirely, and I must do the best I can with this young generation of Lean's, Jean's and Minnies; and Ruth—well, you never could depend on Ruth, for there's no telling when Boaz will come along. "The Woman's Department is to be practical." That means, never jump the garden fence. Stay within the inclosure. Do your work to the sound of the bugle; no other instrument can produce harmony without coaxing.

Blast one—Call for something to eat—(man's first effort). If our Editor don't mire in recipes before Dec. 31st, 1880, it wo'nt be our fault. He will never call for a "thrust" of that sort again. Forty-seven Saratoga trunks won't hold the number we will send him. Since it is fashionable with ribbons flying to mix dough and beat eggs, it's just fun to cook. "A pinch of this and a pinch of that, with a little judgment," is no longer required. It must be a certain man in his rambles about New York City has strayed so far as to join Miss Corson's Cooking School. She is the woman to win his heart. I wonder if he don't carry her "hifalutin" code of recipes in his breast pocket?

Dear sir, you will get no "quail on toast" from me. It will be quail on a stick, or no toast at all.

Blow two—Methods of household, home-made decoration and adornment. Now we have had enough of that. We have decorated, for the last twenty years, the four square walls of every room in the house, until they groan with the load; and for whom? For fathers and brothers and husbands and sons, and not a "mother's son of them" but that prefers outside attractions. There's no life in it. No sir! When we are in the FOREST AND STREAM we will be out of doors too.

Girls! there's no use in being cramped; we hold the mortgage on our acre, and do let us for once get the best of the bargain.

Blast three—Discoveries in botany, and the care of house plants. Bless his dear, generous heart for that.

Blow four—In-door family recreation for winter evenings. Yes—when every member of the family is present; good!

Blast five—Out-of-door study recreation in summer. Grand!

Blow six—Gardening. Superb!

Blast seven—Housekeeping. The proper thing for the girls, who don't know how; but out of place in the FOREST AND STREAM. The blacksmith don't drag his shop into your paper; the mechanic his lathe; the clergy their sermons, nor the doctor his pills. Why should we? Rid of the hackeneyed labors of the day, they sit down to the "feast of reason and flow of soul" that is prepared on every page. No dear editor, give us a few plain hints on free-hand drawing and sketching, and we will be all the better house-keepers for it. But to blow eight—The thousand and one topic—

Bugle blast or bugle blow,
Blow, blow, blow, bugle blow.

Now, girls, if you will follow the tune, I will pledge myself to always "back you" on the thousand and one, and the one will always be somewhere among the thousand. I never could work by note, nor even play by note. I didn't learn that way, and I am two old to make a beginning. But the point I had almost forgotten is: The greatest boon that ever came to America for us, is the bow and arrow. Just think of it! To pin the wings of a dove in mid-air or round the heart of a deer—to fell the wild beast of the forest. A whirr—'tis done. No discordant bang to stun the senses. "Like the breath of heaven the foe shall hear the sound thereof, but know not whence it goeth."

I am through, therefore I will stop. REBECCA.

Well, the Editor and his aids profess to be competent to control every other department of the paper, but when it comes to the Woman's Column he resigns everything. She shall have her own sweet will. We know too much to try to have ours. And we have the fullest confidence, too, that these same women will make a breezy column of it.

RETORT COURTEOUS TO "ONE OF THEM."—*Coralville, Iowa, Dec. 3d.*—I rejoice that the ball is still in motion, and think that the editor of FOREST AND STREAM deserves a medal from the ladies, for so gallantly aiding us in our efforts to accomplish the needed revolution.

These sportsmen—most of them—need writing up. It will do them good. They need to "see themselves as others see them," or rather as their wives see them. The gentleman who signs himself as "One of Them," in the issue of November 27th, seems to need it badly; from his apparent dread of having his little eccentricities disclosed, one fancies that his wife could a "tale unfold that would harrow up his soul and make each individual hair stand up like quills upon the fretful porcupine," (I mean the other kind of "fretful porcupine," not the gentleman).

"Minnie" and "Ruth" have done nobly, and let us hope that the wife of "One of Them" will be the next to speak. ZENA.

FLORIDA INSECTS, LAND, AND HEALTH.—*Editor Forest and Stream:*—I can speak feelingly of Florida pests of all kinds. In winter everything is nice enough, but as soon as spring approaches the pests come in legions. Still, there are places that are quite exempt from mesquitos and sand flies. Fleas abound everywhere, while woodticks and bed bugs are only found on trees and shrubbery; every one who goes out of the house at all is sure to make their acquaintance. Red ants are as thick as the sands, and more or less are eaten at every meal. Cockroaches are as the leaves on the trees, of all sizes, from mites to the size of a small turtle. Scorpions are quite plenty; also snakes of various kinds and sizes, from the pretty "thunder and lightning" to the mammoth "gopher," from the harmless little "ribbon" to the deadly rattlesnake; still, with all these annoyances, it is surprising how soon one gets used to them. By-the-way, do your readers know that the near presence of rattlesnakes can that of a cucumber? Florida is very enjoyable, but everything is not *colour de rose* as some writers would make people believe. The man who writes such glowing letters from Florida is generally a Yankee who has bought several thousand acres of land, for which he agrees to pay two to three dollars per acre. He pays a small amount down, and gives a mortgage for the remainder, and then proceeds to survey and plot his land into village lots and plots of a few acres for orange groves. He then writes letters to the papers, telling them all about the paradise he has found, and wants people to come and help him enjoy it. He will be magnanimous enough to sell them one-fourth acre building lots for two or three hundred dollars apiece, and eight or ten acres for an orange grove for one thousand dollars. This philanthropist never sees snakes. I have heard him solemnly assure a party of northern visitors that a moccasin, which unfortunately made itself visible, was nothing but a southern eel. This is the same man who says "a case of fever and ague was never known here," although nineteen persons died in six months out of a population of eighty, of malarial diseases, in the season of 1878, in one such locality that I know. There are some places in Florida that are not suitable or safe for people to live in during the warm season. Such places are found along water courses and lakes; also, on hammock grounds that are cultivated. Owners of such places have business North in the unhealthy season, or else camp on the sea shore, or else go back to the pine hills, which are reasonably healthy. With proper care, the winter visitor need fear nothing. I have spent the summer as well as winter in Florida, and have investigated the health and resources of the State pretty thoroughly, as well as the subjects of game and pests. NAUTICUS.

PRESERVATION OF IRON FROM RUST.—The protection of ships' bottoms from corrosion has proved a difficult problem to owners; but the fortuitous discovery that the juice of plants of the order Euphorbiceæ, common and luxuriant in tropical climates, preserves iron from rust, is likely to be usefully applied to the preservation of those portions of ships below the water line, not only from corrosion, but from fouling. It seems, according to *Iron*, that during the survey of Natal, some two or three years ago, one of the officers found that when certain plants of the order named were cut during the clearing, the knives were firmly coated with the abundant gum which exuded from them, and that the knives thus coated did not rust. In consequence, experiments with the gum in question were afterwards made by Sir Andrew Clarke, who some two years ago had a sheet of iron coated with it immersed in the waters of the Chatham Dockyard, where everything becomes rapidly foul. On being taken out it was found to be quite clean. The gum is intensely bitter and poisonous, which prevents the adhesion of marine animals to any substance with which it may be covered, and, as the plants supplying it are found in abundance on the seaside in low latitudes, even if this agent should prove only moderately efficacious, it may prove of great interest to the shipping interest.

AN OLD LADY'S GRATITUDE.—A lady 70 years of age expresses great gratitude for the benefit she has derived from Warner's Safe Bitters, and declares her belief that the remedy is a certain specific for dyspepsia.—[*Adv.*

oct 12 1 Cortlandt Street, N. Y.

FOREST AND STREAM KENNEL, Llewellin setter, Rattler, in the stud. Rattler is a handsome blue belton, black points, winner of four bench prizes; sire, Rob Roy, he by Laverack's Fred, out of Slatter's Phœbe, winner of the field trial strain, winner of five English field trials, out of pure Laverack imported bitch Pickles; she by Llewellin's Prince, winner of two firsts and three championships, out of Llewellin's Lill II.; no better blood in America. Will serve bitches at $15. Litters warranted. I am breeding to Rattler the following bitches:—Mell, a beautiful blue belton, black points, sire Jack, dam Spot, winner of first and second specials at Detroit, Mich., 1879, also first at Boston 1879 in native classes; Fly, a very fine roan belton bitch, sire Shot, dam imported Fannie; Pat, orange and white, out of Belle, by Royal George. Puppies bred from above, fine stock, for sale cheap. Address, with stamp, L. F. WHITMAN, Detroit, Mich. Dec11,tf

FOR SALE.—If taken before the 25th of December, I will sell the following valuable setters at a bargain: Imported red Irish prize bitch Floss, who has taken prizes at the following shows: Cork Show, Ireland; Centennial, Philadelphia; St. Louis, Mo.; Baltimore, twice; New York, and Philadelphia. She is a No. 1 brood bitch, and a very quick dog in the field; she will also be in heat in about three weeks' time; price, only $40. Nora, a great, slashing, strong bitch, also Irish, out of Pumpkin and Thompson's Belle; price, only $35. A handsome Llewellin setter bitch, lemon and white; a beautiful bitch, and a pretty good worker in the field; price, only $50. One handsome black, white, and tan bitch pup, whelped on the 12th of May; a large, strong healthy pup, out of A. Burges' celebrated champion Field Trial and Bench Show winner Druid, and the Llewellin bitch Leda; price, $25. For pedigree and particulars, inquire of C. Z. MILEY, Lancaster, Pa. Dec.4,tf

GORDON ENGLISH, AND FIELD TRIAL SETTERS
OF PUREST STRAINS.

THE FOLLOWING PRICES will show I mean sell out:—

Victress, pure Laverack, full sister to the Great Countess, one of the best bitches that ever lived. She is by Old Blue Dash II. and Moll III. Victress won two prizes—Manchester, H. C., Birmingham. To parties in want of a pure Laverack to breed this is a rare chance. Price $75, not one-half what she cost; was sold at public outcry in England for $200.

Irish setter Gipsey, red, and some white; hunted some on quail; very obedient and easy to handle; sire of Gipsy, Rodman's Dash, who was the best Irish setter on game in the United States. She is a good brood bitch, and just served by my red Irish setter King Bee, who was sired by champion York; a perfect beauty, and if she fails to pup will serve her free next time, but she never missed. Price only $35.

France, a field trial bitch; a beautiful head; ears hung low; a good brood bitch; never hunted her; bought her in June; will guarantee her to stand a pigeon in yard for twenty minutes, and from her movements I think would be good in field. Price $25. Litter of pups worth four times that amount.

Llewellin setter bitch one year old, blue ticked; raised and bred by L. H. Smith, of Strathroy, Ontario, Canada; sire, Paris, and dam, the pure Laverack bitch Peeress; Peeress and Paris are both broken, and Paris is one of the best field dogs in this country, that money cannot buy; the Chicago *Field* of Nov. 8th, '79, gives a cut of the famous Paris and his field winnings and on the bench; parties buying will get pedigree and his winnings printed. Price only $50. These are bottom prices.

Address H. B. VONDERSMITH, Lancaster, Pa. Nov 27-tf

SEND FOR CIRCULAR OF REDUCED PRICES

USE THE BOGARDUS PATENT
Rough Glass Ball
AND HIS PATENT
GLASS BALL TRAP

For Wing practice. They can be had from all gun dealers. Headquarters for Glass Balls, HAGERTY & BRO'S., No. 10 Platt street, N. Y., or A. H. BOGARDUS, No. 158, South Clark street, Chicago. For Traps—HART & SLOAN Newark, N. J., or at Bogardus' Headquarters, 158 South Clark st., Chicago. "Field, Cover and Trap Shooting," the only book ever published by a market hunter, can be had at the above address. Price, $2.

THE EXPLOSIVE FLYING TARGET,

PATENTED BY E. REDMOND, consists of a rubber bag inflatable by the breath to the size of a glass ball, with a weight attached that gives momentum.
Any trap throws it; no breakage until hit by shot; bursts instantly: fragments harmless. Blow in tobacco smoke and when the bag bursts it shows. Only half an ordinary charge needed, with fine shot, making them cheaper than glass. Fifteen hundred pack in a square foot. Two dollars a hundred. Discount to the trade.

"THE FISHING LINE."

TAKE THE

Grand Rapids & Indiana R.R.

Mackinaw, Grand Rapids and Cincinnati Short Line

FOR THE

Trout, Grayling, and Black Bass Fisheries,

TO THE

FAMOUR SUMMER RESORTS AND LAKES OF

NORTHERN MICHIGAN.

The waters of the

Grand Traverse Region

and the Michigan North Woods are unsurpassed, if equaled, in the abundance and great variety of fish contained.

BROOK TROUT abound in the streams, and the famous AMERICAN GRAYLING is found only in those waters.

The TROUT season begins May 1 and ends Sept. 1.

The GRAYLING Season opens June 1 and ends Nov. 1.

BLACK BASS, PIKE, PICKEREL and MUSCALONGE, also abound in large numbers in the many lakes and lakelets of this territory.

The sportsman can readily send trophies of his skill to his friends or "club" at home, as ice for packing fish can be had at many points.

TAKE YOUR FAMILY WITH YOU. The scenery of the North Woods and Lakes is very beautiful; the air is pure, dry and bracing. The climate is peculiarly beneficial to those suffering with

Hay Fever and Asthma Affections.

The hotel accommodations are good, far surpassing the average in countries new enough to afford the finest of fishing.

During the season Round Trip Excursion Tickets will be sold at low rates, and attractive train facilities offered to Tourists and Sportsmen.

Dogs, Guns and Fishing Tackle Carried Free at owner's risk.

It is our aim to make sportsmen feel "at home" on this route. For Tourist's Guide (an attractive illustrated book of 80 pages), containing full information and accurate maps of the Fishing Grounds and Time Cards, address A. B. LEFF, Gen'l Pass. Agent, Grand Rapids, Mich.

Sportsmen's Routes.

Through Pullman Palace Sleeping Cars between St. Louis, Minneapolis and St. Paul.

Burlington, C. Rapids & Northern Railway.

QUICKEST, CHEAPEST AND BEST!

TWO PASSENGER TRAINS each way daily, between Burlington, Albert Lea and Minneapolis, crossing and connecting with all East and West Lines in Iowa, running through some of the finest hunting grounds in the Northwest for Geese, Ducks, Pinnated and Ruffed Grouse and Quail. Sportsmen and their dogs taken good care of. Reduced rates on parties of ten or more upon application to Gen'l Ticket Office, Cedar Rapids,

C. J. IVES,
E. F. WINSLOW, Gen'l Passenger Agent.
General Manager. tf

TO SPORTSMEN:

The Pennsylvania R. R. Co.,

Respectfully invite attention to the

SUPERIOR FACILITIES

afforded by their lines for reaching most of the TROUTING PARKS and RACE COURSES in the Middle States. These lines being CONTINUOUS FROM ALL IMPORTANT POINTS, avoid the difficulties and dangers of reshipment, while the excellent cars which run over the smooth steel tracks enable STOCK TO BE TRANSPORTED without failure or injury.

THE LINES OF

Pennsylvania Railroad Company

also reach the best localities for

GUNNING AND FISHING

in Pennsylvania and New Jersey. EXCURSION TICKETS are sold at the offices of the Company in all the principle cities to KANE, RENOVA, BEDFORD, CRESSON, KALSTON, MINNEQUA, and other well-known centers for

Trout Fishing, Wing Shooting, and Still Hunting,

Also, to

TUCKERTON, BEACH HAVEN, CAPE MAY, SQUAN, and points on the NEW JERSEY COAST renowned for SALT WATER SPORT AFTER FIN AND FEATHER.

I. P. FARMER, Gen'l Pass. Agent.

GUNPOWDER.

DUPONT'S

RIFLE, SPORTING and BLASTING POWDER.

The Most Popular Powder in Use.

DUPONT'S GUNPOWDER MILLS, established in 1801, have maintained their great reputation for seventy-eight years. Manufacture the following celebrated brands of Powder:

DUPONT'S DIAMOND GRAIN,

Nos. 1 (coarse) to 4 (fine), unequaled in strength, quickness, and cleanliness; adapted for Glass Ball and Pigeon Shooting.

DUPONT'S EAGLE DUCKING,

Nos. 1 (coarse) to 3 (fine), burning slowly, strong, and clean; great penetration; adapted for Glass Ball, Pigeon, Duck, and other shooting.

DUPONT'S EAGLE RIFLE,

A quick, strong, and clean Powder, of very fine grain for pistol shooting.

DUPONT'S RIFLE, FG, "SEA SHOOTING," FFG and FFFG. The FG for long range rifle shooting; the FFG and FFFG for general use, burning strong and quick.

SPORTING, MINING, SHIFFING, and BLASTING POWDERS of all sizes and descriptions. Special grades for export. Cartridge, Musket, Cannon, Mortar, and Mammoth Powder, U. S. Government standard. Powder manufactured to order of any required grain or proof. Agencies in all cities and principal towns throughout the U. S. Represented by

F. L. KNEELAND, 70 Wall Street, N. Y.

N. B.—Use none but DUPONT'S FG or FFG Powder for long range rifle shooting.

THE HAZARD POWDER COMPANY

MANUFACTURERS OF

GUNPOWDER.

Hazard's "Electric Powder."

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. *only.*

Hazard's "American Sporting."

Nos. 1 (fine) to 6 (coarse). In 1 lb. canisters and 6½ lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shot guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6½ and 12½ lb. kegs. Burns *slowly* and very clean, shooting remarkably close and with *great penetration.* For field, forest, or water shooting, it ranks any other brand, and it is equally serviceable for muzzle or breech-loaders.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG in kegs of 25, 12½, and 6½ lbs. and cans of 5 lbs. FFFG is also packed in 1 and 4 lb. canisters. Burns strong and *moist.* The FFFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard *Rifle* Powder of the country.

Superior Mining and Blasting Powder.

DITTMAR POWDER.

Champion Shot Gun and Rifle

POWDER OF THE WORLD!

IS UNEQUALLED BY GUNPOWDER

for strength, accuracy, cleanliness, and gives little smoke, recoil, or noise. It is absolutely safer than gunpowder, as it cannot explode when not confined, and does not strain the gun or heat the barrels as much in rapid firing. Captain Bogardus, champion wing-shot of the world; Dr. Carver, champion rifle-shot of the world; and all the leading shots, use DITTMAR POWDER in their matches. Our challenge to shoot a long range rifle match, as published in our circulars, was never accepted, and is yet open to the world. Address

"Nahmakanta,"

With the "CROSBY PATENT AXE COVER." The only genuine Camp Axe in America. Says Tac. Hussey: "I am delighted with it; it makes my camping outfit complete, and is just the thing I have been looking for these many years." Send for a circular.

A. S. CROSBY & CO.,

WATERVILLE, ME.

TRADE "APANULE" MARKS.

CURES BY ABSORPTION.

RHEUMATISM, NEURALGIA, MALARIA.

"Sapanule," the wonderful *Glycerine Lotion,* is a positive cure; it has never failed.

"Sapanule" has no equal for Chronic Lameness, Lame Back, Lumbago, Sprains, Piles, Chapped Hands, Chilblains, Bunions, and all diseases of the Skin, Erysipelas, Salt Rheum, Eczema, Humors of the Scalp, etc.; Diphtheria, Sore Throat, Pneumonia, and all inflammatory diseases. Ladies who suffer from local difficulties find immediate relief, and a permanent cure by using "Sapanule." Used in sponge or foot bath removes all soreness of body, limbs and feet. Satisfaction guaranteed or money refunded.

Sold by all Druggists. Price, 50c., and $1 per bottle. Send for illuminated circular and cards.

THE DEATH OF GENIO C. SCOTT.

DEAR Genio, as the passing bell
Above thy ashes peals its knell,
Let me beside thy sable bier
Drop votive wreath and sacred tear;
Strike the sad lyre, that it may pour
A requiem on my friend of yore.

With sorrowing heart I pause, I turn
From silent dust and funeral urn,
O'er the long-vanish'd years to muse,
Still bright with light and fresh with dews;
O'er the departed years to trace
Our mutual footsteps in life's race.
I once again with thee explore
The windings of the streamlet shore,
To cast the line and draw the prey
From the clear ripples where they play;
Or track the coast-line where the spoil
Rewards the patient angler's toil;
Or brush the dew from shrub and grass,
As on from stream to stream we pass.

From memory's blurr'd and blotted sheet
I wipe the effacing dust, and meet
In shining lines the record clear,
Dear Genio, of thy life's career.
And those who lov'd thee long and well
O'er those past years will fondly dwell,
Remembering still thy cheerful ways,
And all the joys of other days.

Ah! the lost dead may never die!
From the blue fields of air they call,
From the green hillocks where they lie,
O'er which the woodland shadows fall.
From the white cloud—a floating speck
In ether—they lean o'er and beck,
Wave their bright pinions and extend
Their palms, whither they'd have us tend.

'Tis only when the long grass grows
Or when the curling billow flows
Above the lost and lov'd of earth
That we can measure all their worth.
Then only with unclouded eyes
The brightness of their life we prize,
When 'tis too late to crown with praise
The crystal sweetness of their ways;
When look and word and deed shine back
Like sunbeams o'er life's trodden track.
O! that we might again behold
Those features, sepulchred in mould!

Shelter Island, Dec. 22d. ISAAC MCLELLAN.

Nepigon Lake and River.

NUMBER IV.

NEPIGON HOUSE is an old established post of the Hudson's Bay Company. It has been, as nearly as we could ascertain, a recognized "house" fully a hundred years. Probably it is much older, as from its position in the centre of an extensive fur country it would soon be appropriated as a point for a depot of supplies and trade. It stands in latitude 49 deg. 55 min. north, being a degree north in latitude and about thirty miles west of the longitude of Red Rock. The canoe and portage route between the two posts is called one hundred miles. There are three or four frame and log buildings at Nepigon House (not including a substantial if not ornamental cattle stable and farm buildings) used as store and warehouses, and the agent's residence. The permanent population is small, consisting of the company's agent and employés and their families. When we reached the post a fine brigade boat lay at the little dock and a larger one rather the worse for wear and age was beached near by, undergoing repairs. These boats had been pulled and tracked up the practicable rapids and taken over the portages on rollers from Red Rock at an immense expenditure of Indian labor. But once in the lake they save much hazardous canoe transportation.

The Indian population right about the post did not exceed twenty-five families at the time of our visit. But in spring time, when the hunters flock in to dispose of the winter's "take," the number is largely increased and the immediate vicinity must present a busy appearance. After the spring trading is over, and the brigades have carried down to Red Rock the thousands of pounds of furs which have been gradually accumulated, and brought back to the post the stores and supplies for the ensuing year, the Indians gradually disappear from the neighborhood, to return the following spring. They go off up the rivers to their various favorite hunting grounds, where game is plenty and fish may be had for the taking. Many go hundreds of miles and thread the vast net-work of lakes and streams which lies to the west, north and east of Nepigon. About two hundred trappers and hunters, being the industrial basis of a thousand people, as I estimate their numbers, are dependent upon this post for trade and supplies. Occasionally during the long season of quiet some light canoe, an "express" I should call it, with its two men comes dashing up. Some tobacco, flour, or tea are purchased, and after a day's rest canoe and men disappear in the shades of the interior woodland region.

The company furnishes the outfits of the hunters almost always upon credit. Few Indians are so thrifty as to be able to buy and pay at the same time. An "outfit" book is kept by the post (I might say by every such post), in which the state of any debtor's account is accurately registered. Payment is made the following spring in furs. When one reflects that from the time the outfit is procured six to ten months elapse before the agent sees his customer again, and that the latter is all of that time hundreds of miles away in the wilderness, the fact that he does return and pay his scores speaks volumes in favor of Indian honesty. Certainly, in point of personal integrity the Indian should be placed on a higher plane than the average white. But with the existing system of communication between posts a defaulter would soon be found out and further supplies cut off. So that between native honesty and the company's care few losses result, and these in the main as a necessary consequence of death or sickness. I believe no civilization has yet been developed where losses do not sometimes occur from a credit system.

The goods furnished by the company are of an excellent quality always. Prices seem high, but taking into consideration the nature of the business, the extent of credits, the cost of transportation and service, I am of opinion that the goods could not well be afforded at less rates. Sometimes, when from any cause the yield of furs is light and debts cannot be paid, the company, by judicious distribution of the necessaries of life, without immediate reward, saves the poor, poverty-stricken redman from starvation at least, if not from suffering. A wise policy, it is true, for the death of the Indian would be a loss of future business, but these things ought in fairness to be taken into consideration in adjusting the equities of the fur trade. From my study of what was written of these regions a hundred and more years ago, and from present information and observation, I believe the native population has within that period increased in numbers and advanced in comfort under the influence of the company. There is no doubt whatever of an actual advance in the physical condition of the population.

The Nepigon Lake Indians we found in an excellent condition as to health and comfort. They were well fed and well clothed, and with considerable development of good looks. Their canoes, though not large—for the rivers in which they spend most of their time are too shallow for other than small ones—were the finest as to lightness and beauty I have ever seen. As the "canoe Indian" is graded in his wealth by the number of his canoes—like the "prairie Indian" by his horses—these were wealthy. It was not uncommon to see three or four beautiful birch bark shells drawn up at one wigwam. They sat upon the water like feathers, and the speed at which two small paddles would impel them spoke well for the efficiency of the model upon which they all seemed to be built.

It was Saturday evening when we arrived at Nepigon House. On Sunday morning we had eighteen fine capable and pleasant aborigines to assist us in disposing of our repast. They were willing souls and very friendly, and took most kindly to unlimited pork, potatoes, hard bread and tea with sugar in it. But after that meal, which with our limited kitchen appliances lasted well into the afternoon, we felt called upon to give orders to draw the lines more closely. A few days of this and starvation would stare in our faces; still, in spite of cautions and orders, a few extra hands would find their way into our trenches every time it was produced.

Early Monday morning we started out for trout. Grasshoppers being plenty on the hayfield of the post, we captured a bottle full for distribution in likely places. But no trout would rise to them, and whipping the shores and points with our fly rods was without result, except one four-inch trout right at the mouth of a trickling stream; so, finally abandoning all hope of speckled, or, as some at Nepigon House called them, "swamp" trout, we took our spoons, and by trolling close to the bottom in deep water, added a few lake trout to our larder. While so fishing, R. attached to his rod a small metal spinning minnow, hoping to have a little "brush" with a lake trout, when, after dragging it slowly around for a few minutes in sixty feet of water, a vigorous strike rewarded him. In due time, he landed his fish, and it proved a four and a half pound *salmo fontinalis*. He was hooked at least half a mile from shore. This was a new experience to all of us.

Mr. Le Ronde had been at this post more than twenty years. His brother Alexander had had his home here nearly all his life, although he had spent much time in the United States naval and mercantile marine service, and was a very intelligent man. They both assured us that trout spawned in the sandy bays of the lake close to the shore, about the middle of October, and that quantities were sometimes, and always could be, taken at such places and times by hauling seines; that they were larger than the Nepigon River trout, and had been taken weighing everywhere from five to seventeen pounds. The latter was the largest either of them had ever weighed. In the fall of 1878 the largest taken weighed on the company's scales nine pounds. Trout are never intentionally taken by the Indians in their gill nets, because they fight so vigorously as to injure the nets beyond the value of the fish. The men at the post, however, desiring a change of diet, sometimes in the fall make a haul with a strong net, when the trout are spawning, with the results I have named. These gentlemen are men in whose statements I place great confidence; and, added to this, are those of an intelligent Indian, independently obtained by inquiries made by Louis at my suggestion, in full corroboration. Of course the Indian could not give weights, but his description of sizes would indicate weights substantially as above given. We saw some trout on the other side of the lake, taken in gill nets near one of the islands. The largest measured, as he lay upon a rock, twenty-four and a half inches long, by a girth of thirteen and a half inches. When I say that these measurements were taken many hours after the fish had been cleaned, and after being taken eight or ten miles to the mainland, the experienced fisherman will be able to arrive at some idea of the actual size of the fish. My estimate of the weight when the fish was first taken from the water, and before removal of the viscera, would be not far from seventeen pounds.

Upon the evidence as it stands, the existence of huge trout in Lake Nepigon cannot reasonably be disputed, But where by lure of the fly they can be taken is yet to be found. That they can be so taken is reasonably certain, from another fact learned from the Indian who had taken the fish last named. He said their stomachs contained both minnows and *flies*—such flies as were occasionally to be seen upon the water.

As to trout spawning in the shallow sandy bays, the facts stated were new to me. I had long doubted the general theory that trout in Lake Superior had their breeding places in the rivers. I have taken trout in places miles from any stream. They are, I have been informed, caught where to reach a stream there must be a long travel through to reach deep water. I have never seen their bones in Indian encampments at the mouth of streams where trout could not be taken at all times in season. We know they seek for breeding grounds where the water is cool and in motion. These conditions are constant along the shores of Lake Superior, and presumably, though to a less degree, along the shores of Nepigon. The latter lake is closed by ice in winter, so that one condition of motion cannot constantly exist along its shores. Yet the fact (for so I consider it) remains that the trout does go to its shores at the spawning season. There is abundant food for trout in the lake. It swarms with minnows and small fry of different kinds, though there is no especial exuberance of insect life that we observed, such as exists along the river. From my observation and information, I am strongly inclined to the belief that the places where fly fishing will succeed, will be found where the conditions of deep water and rocky island shores co-exist in the northern half of the lake. The southern part has been pretty fairly tested, and many of the points along the mainland also. I may add that white fish and lake trout are abundant in the lake. Your readers will pardon this digression from the straight line of my story, I trust, for it will save other reference to this subject, about which so little has hitherto been known. I am sorry I cannot give more definite information. Your readers may be assured we sought faithfully for it.

We stocked up in pork, flour, sugar and tea at Nepigon House, and on Monday afternoon, after a friendly good-bye to Mr. Le Ronde and his brother, we moved north along the western shore of the lake. Of course we had had our canoes thoroughly re-pitched before the new start, and felt prepared for leaving this last reminder of distant civilization. We were not alone in leaving it, for we shortly came in sight of two other canoes, bound for the same Wabenoosh river with ourselves, and in the hot sun slowly paddling along the coast. One of them held a young Indian with a single wife (older ones are not always so restricted) and their papoose. She was engaged when we passed in administering maternal nourishment, the bow of the papoose frame over her shoulder, and in paddling with vigor and skill. Whatever spare energy she had she was using in chewing spruce gum as de-

votedly as a civilized school girl. When the infant slept the frame to which it was tied was carelessly laid across the top of the canoe, only four or five inches above the water.

A pull of ten or twelve miles in the hot and breezeless afternoon, relieved at times only by the shadows of the overhanging cliffs along the shore, brought us along the side of that grand old bald rock which two days before we thought a near inland height. It seemed as we turned a point to spring suddenly an island out of the depths of the smooth water, its eight hundred feet of precipitous wall reflected as from a mirror. Off to the north-east, miles away, stood the other rock, so like it that one almost fancied it a purple shadow of the one to which we were so near. Now and then the further one, from some peculiar condition of the air or water, seemed to be shortened in at the water's edge, and project a rounded form far over its receding base. The two "Barns," as they are called, are not like any other lake islands in appearance, and apparently not in geological structure. They look like some of the cliffs along Nepigon River, a hundred miles away, save that there is no mark to be discerned of the abrading action of the glacier. The inner Barn stands like a battlemented fort at the entrance of Wabenoosh Bay. When we came alongside its majestic heights we could hear the faint roar of the Wabenoosh falls, three or four miles distant, and as the purple hue of the declining day began to climb the wooded steeps on either side of us, we pushed vigorously on, occasionally looking back to see if the great rock which had so suddenly burst upon our view was real and permanent, or only a dream of solitude and grandeur.

Guided by the sound of the falls, we entered the mouth of the river and found ourselves in a great pool or basin, with a rim of hills that looked like mountains in the fading light. The falls looked promising, and going up the well worn portage path past them, F. quickly secured a beautifully marked trout of a pound weight. No others rose to his fly, although further up the stream we could see them jump ing quite freely. The water was of a dark red color, and of 60 deg. temperature. The Indians who were camped near us said we could take many of the size of the one F. killed about a day's journey further up the stream. This river is a favorite highway of Indian travel, as shown by the well worn portage trail.

We had no time to spare, however, in canoeing up the river, so early the next morning we floated out into the bay, and paddled along its northern shore. The one great island of rock, the only island of that bay, seemed in the morning sun even higher and grander than in the evening light, while far out to sea, the faint shadows of more distant islands could be seen upon the water. A mile or more ahead of us appeared a swiftly moving speck of green foliage, which our keen-sighted guides pronounced to be a canoe with coon hunters. It made scarcely a ripple on the surface, but the coons were further out in the lake, and after we had rounded the point of the bay and left the disguised canoe behind us, we heard the mocking laugh of the great diver, and saw him disappear beneath the water. Once or twice we essayed a shot at the beautiful bird, and once we thought, and still think, the ball roughed his feathers, although he escaped us. A flock of young sawbill ducks Wassy routed out of the rocks by the shore, but they were not game for us.

About eleven o'clock we reached the mouth of the next river, known by the name of White Sand. A deserted cabin on the lake shore shows where, in the old times of rivalry in the fur trade, a temporary post had been established. We could hear the noise of falls, and tried to ascend the narrow but swift and deep stream. But trees across it, snags without number in it, and the warmth of its water checked our ardour, and we fell back to an old Indian encampment for dinner. An abandoned canoe furnished birch bark for a fire, and we had a hurried meal. This river, at least below the falls, runs through an alluvial formation, densely wooded with poplar and birch, with occasional cedars. In the afternoon we made a few more miles, but rain coming on we camped at a sand beach, back of which there was a dense forest of fir and birch, the latter of fine quality for canoe-building. The shores had been gradually becoming less steep, although at intervals a spur of the interior hills would reach the lake and end in an abrupt and rocky bluff. But where the sand-beach ended there seemed to be the same roughness of surface which I have referred to before as characteristic of the island formations further down the lake.

ATTRACTIONS OF GALVESTON.

TO one who is fond of seaside delights I can't see how any place could be more attractive than Galveston. Here he can have old ocean to his liking. The city is situated on an island thirty miles long and from a half mile to three miles in width. It is at the east end of this island. Here, then, we have a beach fronting on the Gulf of Mexico some thirty miles long, composed of clean, compact sand, as smooth as a parlor floor. It is a glorious place for a drive. There is almost always a good breeze on, and the great breakers roll in and dash themselves to pieces under the wheels of your vehicle. It is amusing to see these breakers chasing the little boys and girls up the beach. There can be no better sea-bathing anywhere. Last night I spent an hour or so in the Gulf in a bathing suit, and sounded the bottom at least three hundred feet out before I found it growing too deep. The water deepens very gradually, and the floor is all that the bather could wish. Every night there are thousands of bathers. There are sharks enough all around the island, but they never come in among the breakers, and there is no instance of anybody ever being hurt here by one. Sting rays are sometimes about, but I cannot hear of but one instance of their stinging here. That was a young lady. She fainted away with the intense pain, but soon recovered, and no evil followed. The sting of the ray is not poisonous, any more than that of a wasp, but I judge that it is terribly painful while it lasts. Sometimes medusæ come in, but it is easy to avoid them, and even if one comes in contact with them I understand that the damage done is very trifling—so little, indeed, that it is hardly worthy of mention. It is said to be a sort of prickly sensation, like that of a nettle. In Galveston Bay I have sometimes seen those medusæ in flocks of thousands. These are the only annoyances—the dread of them—that the bather is subjected to here, and harm from them results so rarely that none but novices and strangers ever think of them.

For boating and yachting Galveston Bay furnishes an ample field. This is the body of water lying between the island and the mainland, from five to twenty miles in breadth and about seventy-five in length; perfectly landlocked everywhere except at two points. For pleasure boating it has no superior in American waters. Fishing is fine at all seasons. Just now the amateur is having all the sport he wants with the trout, or weak fish, or I suppose it is the red fish, the sheepshead, croaker flounder, etc. These are all biting ravenously. That monster, the jew fish, is also abundant and eager to strike a hook, but as he ordinarily carries several hundred pounds avoirdupois, the amateur fisherman is by no means eager to hook on to him. This fish, as big as he is, is not excelled, I believe, in excellence for the table by any fish of our waters. Another fish that is very numerous in the bay is the tarpum, grand ecaille, or silver fish. He will take a hook readily, but is rather shunned by the fisherman than sought by him. He has the repute of being dangerous. He has a habit of jumping very high in the air, and caring very little where he falls. He may fall in a fellow's boat and upset it, or he may fall on a fellow and kill him. They have knocked men out of their boats in this same bay and sometimes drowned them. They reach as high as 200 pounds and over; beautiful as can be, but not good to eat. They sparkle all over like new ribbon. In the sea they are continuously jumping, and in that line can beat a porpoise all hollow. They are from the tropics, and with the first breath of cold air they leave. When caught on a hook their behavior is said to be very much like that of a wild horse when first roped, only ten times worse. They have the saw fish here, too, quite numerous. One was caught in the bay the other day, twenty-two feet long. He was playing in four feet water and was dragged ashore in a seine. These are only a few of the fishes they have to amuse themselves or stir the flood with here.

As regards climate this is one of the most fortunate seaside resorts in the world. It is a rare thing that the mercury reaches 90 here at the hottest season of the year. From 80 to 85 deg. is about its midsummer range. At night it falls to 75 and lower. This makes a delicious climate. There is no reason why Galveston should not become a great summer resort, except probably yellow fever, which does sometimes put in its appearance here. It has not been epidemic for twelve years.

The city is a beautiful place. It is filled with orange trees in full bearing, and oleanders covered with bloom. There are delightful shady walks to talk love in, and indeed nooks to hide in. Oranges and oleanders make a very dense foliage. The population is about 35,000, I judge. Many of the buildings are very costly and grand. FOREST AND STREAM has a numerous family of friends here, and there is one thing that I cannot help observing, and that is, that these readers and friends of FOREST AND STREAM are the best and most cultured men in the city. I find it so wherever I go. It must indeed be a pleasant thing to write to such a constituency as that. In fall and winter, sport with the gun is superb here. The bays and bayous are filled with wild fowl. N. A. T.

Galveston, Texas, Aug. 23d, 1879.

DUCK SHOOTING IN DELAWARE BAY.

(Continued from issue of Dec. 18th.)

THE *modus operandi* of shooting wild fowl in this part of the world (Rhehoboth Bay) is rather primitive, as I am informed by a Philadelphia sportsman, a prominent member of the N. E. S. C. Club, who slaughters ducks at notheast Chesapeake Bay from a sink-box, and whom I met at this place on a "wild goose chase." Said he:

"These people get an old mule and drive him up and down the shore every day for a week or more until the geese become accustomed to him, and not only do not fly off, but actually swim shoreward and within gunshot; and, at the proper time, every preparation having been previously made, the rider slides off the animal's rump, rests his gun, or 'cannon' on the beast's back, and 'pulls on to 'em,' and the result is generally from fifty to seventy geese at a shot. (This, although the actual statement of my informant, I took in without questioning, but mentally allowed a large margin for shrinkage.) "And what is most astonishing about this mule business," added my informant, "is, that the animal is so trained that he acts as a retriever, swimming out and sloshing around among the dead and crippled geese, and bringing them ashore."

As we had no mule handy, we were compelled to forego the pleasure of this novel and interesting mode of shooting wild geese. The wind being off shore and light, I took a stroll along the beach, and picked up quite a lot of beautiful shells, and met one of the residents of this isolated region, who was the owner of quite an extensive farm (400 acres), but he complained of the hard times, and said he "reckoned he'd hev to give up raisin' corn now, as wages hed got as high as thirty cents a day." Upon my arrival on board the yacht in the evening I reported progress, and we unanimously agreed to leave this place as soon as the wind shifted and removed the sand-bar. We killed nine geese during our stay, the result of two nights shooting on the ponds. The moon shone very brightly, and, reflecting upon the white sand, added much to the loneliness of the situation, and no sound was heard save the far off murmuring of the surf as it broke upon the beach, and now and then the solitary honk of an old gander speaking to his mates.

At last the wind shifted and removed the sand obstruction at the mouth of the river, and we got under way, glad enough to leave this God-forsaken spot, and once more breathe the free air of old ocean.

Homeward bound! Ran across the bay, and arrived at Cape May, landing at 1.30 P. M., and after a look through this almost deserted "city by the sea," to boat again, and, as the sun went down behind the glistening sand hills of Henlopen, hove anchor," and, with a spanking sou'-wester and a bright full moon, "sheeted off," and went bowling up the bay. The lights of Cape May, Cape Henlopen and Brandywine shoals cast their reflections upon the silvery sea-caps, as our little yacht careened over, as though bidding them a graceful adieu, and soon—very soon, it seemed—the lights of Egg Island, East Point and the Ledge, like twinkling stars came up out of the shimmering sea. It was a glorious night, and Capt. Wilkins, who is an old yachtsman, and used to all kinds of weather, remarked, as he handled this handsome little craft, "Boys, isn't this beautiful." I can scarcely call to mind a time when I felt so supremely happy. How glad I am that we have escaped from that miasmic lagoon, with its pestiferous vermin (mosquitos) and unsavory odors, and are once more permitted to breathe this pure air.

Off, under our lee, many outward bound vessels were anchored, waiting for ebb tide to carry them on their journey. In Morris River Cove their lights shone like fireflies and seemed to dance merrily to our joyous songs. Running around under the lee of False Egg Island, we came to for the night. In the morning, dropped in at the mouth of Straight Creek, so called on account of its excessive crookedness. Here we met a salt-hay Jerseyman, captain of one of those shallow crafts that Wilkins calls a "sea-pounder." This individual and Wilkins entered into a conversation in regard to the creation of the world, when the irreverent old cuss remarked: "Well, I've hearn that the Lord made the world in six days, and my kalkerlation is, that He made the world in one day, and it tuk the balance of the week to make Straight Krick."

Wilkins was shocked at the man's impiety, and lectured him soundly for it. The sloop, the man, and the creek had been old chums for the last hundred years, and I spent the balance of the day trying to cipher out which was the crookedest.

After the evening shooting we ran up to Fortescue. Straight Creek heads in a thousand ponds which are connected by narrow waterways and extend over hundreds of acres. I met an old duck shooter here, who informed me that geese and brant make this their resting-place after long flights, and are found here in almost countless numbers during the latter part of February and early in March on their return to their Northern homes.

Mayberry entertained us this evening with some somnambulistic antics. First he began with a sort of a wailing sound, which, I presume, was an attempt to sing; next he shouted "change partners!" Just at this moment a cork popped from the mouth of a porter bottle, when he rose up and exclaimed: "Who discharged that gun? It has blown off the whole deck of the yacht!" Jack was now wide awake, and had risen up in his bunk to a sitting posture, his straight black hair stood on end, and, with his dark, swarthy features, he looked like a Ute warrior. Patton very kindly took charge of him, and tied a wet towel around his head, and, after administering a "hot jigger" for his "innerds," he was tenderly put to bed again. The band played no more that night.

We remained here two days with indifferent success. Our evenings, however, were passed pleasantly at the Fortescue House. A party from a neighboring village met here the second evening to have an oyster feed, with "knocking apple" for lunch. Reader, have you ever "perpetrated" a "ho-down" to the "Arkansas Traveler" with a South Jersey lassie for two hours without intermission? No! Well, don't do it, for I know somebody who did, and that same individual perspired away five pounds of good solid flesh to "forward two," "change partners," "sling corners," etc. Mayberry desires to be excused.

Under way again. Our gallant little craft, as though tired of a quiet harbor, is making good time under double reefed mainsail and full jib. The fresh nor'wester is directly ahead, and the sea short and chopped up; but "the old gal" (as Patton affectionately calls her) takes to it kindly, now and then, however, playfully tossing the spray into our faces as a gentle reminder that she means to be treated properly. When off the mouth of Back Creek a tremendous squall struck us, which knocked us down to our dead-lights, and the water ran over the deck. Wilkins, quick as lightning, gave her a short luff, but she was too far gone to mind her helm, and the next instant about four feet of sheet. She came up into the wind about four feet of sheet. She came up into the wind shaking like a scared racehorse, when Wilkens turned her bow towards Back Creek, where we came to anchor within a hundred yards of our first stopping place. We laid in a good supply of oysters and fish, and leaving Patton to attend to the cooking department, again shouldered our guns and started off for the ponds. The ducks were exceedingly tame (a new flight having arrived), and we killed thirteen. The next morning a pair of sprig-tails flopped down close to the yacht. Wilkins paddled Clark, our crack shot, up to within twenty yards of them when he "let go both barrels" and never "rumpled a feather."

"Somebody drew the shot out of this gun, or I'd have cut those birds all to pieces," said Clark, with terrible emphasis, and his amiable face lengthened into a painful expression.

"Oh, no," said Wilkins, "the cause of your missing was, that you shot from the left shoulder."

Wilkins killed the same pair of ducks in about an hour afterwards and gave them to Clark as a peace-offering; the latter accepted with calm dignity, but did not fire another shot the balance of the day, although it was one of the best days we had during the whole trip. He has forgiven Cap the trick; but don't mention left-shoulder shooting to him—at least not for some time.

I took a trip up to the "Drum Beds," and through the creeks and branches, and started a few black ducks, but the fresh-water ponds were frozen and the birds were barred out from their favorite feeding grounds. Northwest winds invariably drive the ducks across the bay to the Jersey side, and they go far inland from the bay shore among the swamps and shallow ponds. I met a native of the soil" who had been reared in this place, "native of the soil" who had been reared in this place, and who had not yet heard of General Grant or the Rebellion, and he told me that it was eighteen miles to the mouth of the creek where our yacht lay. I mentally multiplied it by two (for up and down), and, had I not been reared by a Christian mother, I should have "cussed" that Jerseyman. I started for the yacht; the shades of night were closing around me, and the keen northwest wind, blowing directly in my face, soon froze my moustache, and I had an assortment of icicles hanging down over my mouth. Flood-tide caught me, and the air was filled with scurrying snowflakes. I had a little twelve-foot ducking skiff and a good broad ash paddle, and, as I drove my little craft across the tiny waves, the spray dashed over my face and froze; and I verily believe that had I been a temperance man, I should that night have broken the pledge. I came to the conclusion that night

that Cumberland County miles never shrink. I reached the yacht at last, cold and hungry; but the cheerful fire and a cup of coffee soon restored me.

Now let me say, that if a city sport is desirous of becoming famous as a duck shooter, he can lay aside his comfortable ulster, draw on a suit of corduroy, "dead-grass color," which, by the way, he will find "more cooling than a dose of salts;" get a choke-bore, load his shells with chilled shot, then roam around loose among the ditches and salt holes of a Jersey marsh, or take a mess of Cumberland County miles in a twenty-pound ducking-skiff.

The next morning the sun arose clear and bright, with increasing wind from the West and lots of ice around the bow of our yacht, with diamond-like dots of spray clinging to the rigging. Let me remark just here, that Clark, our crack ducker, in one of his enthusiastic moods, while the weather was warm, said:

"I wish it would get cold enough to freeze the hair on a dog's back, then we would knock the ducks." Now, if knocking ducks through the dead-lights of a comfortable yacht's cabin is the sportsmanlike manner of doing the thing, then our amiable friend may be counted in; but I noticed that everybody had business inside this morning. Frozen oysters for lunch to-day. After the sun had been about three hours up, we cleared off some of the ice and made sail, and were off again under a double-reefed mainsail with jib stowed. The yacht needs watching and careful handling. Every now and then a heavy squall comes sweeping across the ten miles of salt water and we lay clean down to our gunwales. Hope Creek is reached after a quick run, and we again come to anchor to find the place has been "shot out." A muskratter, whom we met in the creek, informed us that a steam yacht from Philadelphia (I forbear to mention her name,) had been there a couple of days before with twenty-seven shooters, and six colored men to carry their guns to the blinds. These were some of our politicians, or city fathers, as they are called, on a marine lark, or private drunk. We found nearly all the available points converted into forts, each one large enough to hold half a dozen men and a basket of champagne.

One day was enough here, and we are again on the move. We now make a long run, passing Port Penn, Salem, Delaware City, New Castle, Pennsville, Wilmington, Pennsgrove, Grubb's Landing, and Marcus Hook, and stretching away for Jersey again, come to anchor on our old reedbird and rail ground, Racoon Creek. We are now only twenty miles or so from home, and this will be our last night out, for to-morrow we start for home. We have been gone three weeks, and yet home, with all its comforts and social surroundings, scarcely makes amends for the change from the free life we have been living; and when we shake hands and part from our comrades, we even wish the trip had been a longer one.

Clark shot a beautiful mallard drake this evening, which he has had mounted, and it is the prettiest specimen of its species I ever saw. Mayberry and Wilkins were stooling off the mouth of the creek about dusk, and saw flock after flock of brant slowly passing down along Hook Bar. They flew low, almost touching the water, but did not stop. Gunners from Chester and the Hook are on the alert, and long after nightfall the booming of heavy guns could be heard echoing and vibrating among the Jersey sandhills and along the islands of Christine, carrying to our ears the death-knell of hundreds of these weary, "trading" water-fowl. Since our return I have been informed that one skiff boated 31. This, I believe, is unprecedented in the waters of the Delaware.

The next morning breaks bright and beautiful; the weather has moderated, but there is a splendid breeze from northwest. We up anchor and make sail again—no need for reefing—and the gallant *Zimmerman*, even with its flavor of sour krout and plodding slowness, steps out like a racer. Patton has all his cooking utensils scoured and cleaned, and the cabin is "tidied" up. We skim close to Morrison's Island with the young flood. Chester buoy, famous as the rounding point in our yacht races, lies to our left. Thompson's Point, Lodge's Point, Billingsport, Red Bank and Gloucester are passed in rapid succession, and in two hours and forty minutes we are anchored abreast of Wilkens' boat-house at Cooper's Point. We step ashore and roll about among the fresh-water sailors, and there is a general hand-shaking all around.

Allow me, now, to add a few words in conclusion. On a trip of this kind we are thrown upon our own resources for everything social, etc. We quickly learn that we are each dependent upon the other; a selfish man is soon cured, or—he goes home. To make a trip of this kind a success, the whole party should—aye, *must* be a unit. A man must learn to accept the disagreeable with the pleasant; and it is wonderful how soon you get to the bottom of a man if there is anything light in him. He cannot conceal; it will crop out; and he is sure to return to his friends socially and morally improved. A month's trip of this kind will make a respectable man out of an indifferent boy. The great secret of all this is to adapt oneself to all the circumstances that may present themselves, and be careful to say and do nothing to hurt another's feelings, even in jest. We were well supplied with reading matter, the most interesting of which were six months' files of the American sportsman's text-book, FOREST AND STREAM. COMMODORE.

ZACA LAKE, CALIFORNIA.

A PARTY consisting of six ladies and gentlemen left Santa Barbara early one morning in July, for a hunting and fishing camp on the Zaca Ranch. The first day was very warm, and our horses not being used to long journeys, we only reached the Gaviota Pass in time to make camp before dark. The camp was astir and fire burning brightly by four o'clock next morning, and before six we were on the road again. This day was much warmer than the last, and there was nothing to relieve the monotony of the drive until at last we reached the Zaca Cañon. Hastily swallowing a few mouthfuls of food and a cup of strong coffee, early the day following we shouldered our rifles and started up the creek in the direction of the lake. We had hardly gone half a mile before we saw a large buck standing on a ridge looking at us. We tried to stalk him, but he started before we got within gun-shot of him. We walked several miles up the creek until we had climbed up a steep trail for nearly a mile. Just as we reached the top, and the lake met our view, a band of deer started up the hill. F., who was ahead at the time, raised his gun and fired, and a large doe dropped. She regained her feet, and started along the base of the hill. We saw that one of her hind legs was broken, and so she could not climb the hill. We had a young dog with us, and we turned him loose after her. He ran her about two hundred yards, and bayed her, and I ran up and shot her in the head. Now we were in a quandary, for we had left our pack horse in camp, and it was about five miles distant. We decided to carry the deer in on our backs. We reached camp late in the afternoon, tired, hungry and dirty, and that night we were both taken sick, caused, I have no doubt, by the unusual exertion of packing the deer. The next two days were spent lying around the camp trying to summon up courage to try it again.

The lake is nearly three thousand feet above the level of the sea, and contains some fifty acres. It is surrounded by tall mountains on all sides, and I think, from the general formation of the country, that it is the crater of an extinct volcano. Three feet from the bank the water is ten feet deep, and in the centre of the lake no one has ever been able to find the bottom with the riattas and stake ropes that are brought along. The water is quite warm—too warm, in fact, for trout to live in. There is no visible outlet, but the water never overflows, and never seems to get any lower. Some miles further down the coast I have seen jets of steam coming up out of the earth so thick that I thought it was a camp-fire burning, and on going up to it found a large hole in the ground, and the steam pouring out, and the cattle were crowding around it to keep warm. This, and the warm springs that break out everywhere, lead me to think that the lake is of volcanic origin.

Having fully recovered, L. and I started out. After going about two miles we stopped under a tree to rest, and while lying in the shade two bucks came out of the brush and walked almost within shot of us, and went under a tree and lay down. We crawled around a small knoll and then ran down a ravine until opposite to them. We then climbed the bank and soon came in sight of them. As they started to their feet we fired. The one I shot at fell dead; the other ran about fifty yards and stopped, when we both fired again, and down he came. We found that L. had broken his deer's leg at the first shot, and our two last balls were within two inches of each other in his shoulder. We packed these into camp, which we reached about eleven o'clock.

The next day we killed three good deer—he two and I one; and the day following we took our rods and lines, and started out to catch some trout in a stream that ran close by the camp. Luck was with us, and we returned to camp with fifty-two beauties. These trout, we were surprised to find, all had spawn in them. Our trout usually spawn in the spring, after the heavy spring freshets have subsided, and naturally we were surprised to find spawn in them late in July. But spawn or no spawn, they were delicious, and the whole crowd made a meal off them, and still had some to spare.

All next day we were engaged in building fires and drying our superfluous meat, so that in the long, wet evenings of winter we might gnaw at a piece of "jerky," as we sat by the fire and recounted the hunting exploits of bygone days.

The following day we travelled all over the hills, but failed to see a single deer, although the signs were thick and fresh. Flies and gnats were very thick, and bothered us greatly, and I think must have driven the deer to seek some more secluded place, where the flies did not abound in such great numbers.

While we were engaged in deer hunting L. was shooting quail, and every day brought quite a string. They were very plentiful, and although they became very wild after being shot at so much, still L. always brought in enough to make a good meal once a day. The last day we stayed in camp F. and I started out for our last hunt. I can't begin to tell how far we walked that day. At last, having almost given up in despair, we saw a deer's head through the wild oats. On approaching nearer, a fine spike buck jumped to his feet, and was immediately shot through by F.'s unerring rifle. The buck ran headlong down the hill, and as we were hurrying after him I saw the mate to him standing within thirty yards of me. As I hurriedly raised my rifle to my shoulder it went off into the air. I pumped in another charge, which went the way of the first. A third shot was sent off in like manner, the deer all the time standing perfectly still looking at me. As the third shot rang out he started, and ran the hill. Just then F. saw him and shot him through. He was hit very hard, and began staggering off, and I, thinking he would get into the brush, called to F. to shoot again. He fired and shot under the deer, who then ran over the hill. We went down the ravine after the first deer, and started it up, and our dog started after him. Dog and deer went over the hill, and as we were hurrying after them we found a large pool of blood where the second had laid down and been jumped up by the dog, and had run into the brush. Soon we heard the dog bark, and following the sound, found the deer at bay. As soon as we had despatched it we started back for the other one; but after searching about a hour gave it up, and started back to camp with one.

Next day saw us, at its close, camped in the San Ophire Cañon, within twenty-five miles of Santa Barbara, and by four o'clock next day we were home. E. C. T.

Fish Culture.

UNSOUND AND UNSEASONABLE SALMON SOLD ABROAD.—Canadian Fish Commissioner W. F. Whitcher takes official notice of the complaint published in London *Land and Water*, whose editor is a government inspector of fish, that unwholesome salmon from Canada were lately sold illegally in Liverpool, in the following letter, which, besides correcting a false impression, adds some suggestions which well deserve consideration in the United States, as well as in Canada and Great Britain. We refer to what he says respecting coöperative measures to prevent evasions of law. We have ourselves already had a great deal of trouble with the question of the right to sell in close season such game and fish as have been legally killed in open season:—

Dr. Buckland correctly assumes that no Canadian salmon river is now legally open for nets. Our fishery laws forbid netting salmon after the 1st of August in Quebec and Ontario, and after the 15th of August in New Brunswick and Nova Scotia. Therefore, any freshly netted fish marketed after those dates would be subject to confiscation as being both illegal and unseasonable. Of course there can be no such thing as "clean, fresh-run fish caught in Canadian rivers in October; but salmon preserved in snow and ice, or frozen in a fresh state by the artificial process, and shipped to the trade and consumers during the winter months, has been a common article of commerce in this country. It is quite lawful to buy, sell or possess them in Canada throughout the close season if they have been lawfully caught in open season. The same rule exists in England. Our fishery laws provide a "lawful excuse" for their possession, and it is the duty of the owner to produce proof of legal origin if required. This department adopts a system of granting certificates, which *bona fide* traders find it beneficial to observe. The same plan might apply to exportations from Canada. No doubt this new enterprise of sending Canadian salmon to English markets at a time when the sale of salmon assumed to be caught in Great Britain is prohibited by imperial statutes and local regulations, will necessitate the adoption of coöperative means to prevent evasions of those laws, without at the same time depriving Canadian dealers of the advantage of English markets in winter time, and the British consumer of the benefit of a desirable variety of fish food. How to accomplish this requires some consideration. Meanwhile it would be very unfortunate if hasty prejudices should arise on the other side, or that illegal practices should prevail on this side of the Atlantic, to defeat the venture of Canadian traders, and to deprive British consumers of any benefits attending competition and an enlarged supply. There is a possibility that "tricks of trade" may have something to do with the present aspect of the case to which Dr. Buckland draws attention.

Ottawa, Nov. 27th. W. F. WHITCHER.

TROUT IN THE JORDAN.—A mill-dam is in process of building on the River Jordan, Michigan, and the anglers, who visit that famous stream for trout and grayling, will be pleased to learn that efforts are being made by energetic members of the guild to secure the erection of a McDonald fish-way. There is good reason to think that the fish-way will be built, and the fishing preserved. The Jordan is far too valuable to the residents there, to be thoughtlessly destroyed as an angling stream. A valued Chicago correspondent, who has had the foresight to see the threatened destruction of his favorite fishing grounds, and enough public spirit to act vigorously, and at once writes in regard to better protection of fishing waters:—

It is no use talking; we must come to the same system adopted in Europe, if we want trout fishing. The streams must be better protected; and, though it may be contrary to the spirit of the institutions of this free country, yet in time the rights of land-owners against trespassers will come to be recognized and respected.

There will be no need of eating liver-fed trout, if clubs can lease and control streams that are the habitat of trout. I know a stream, mentioned sometimes in the English *Fishing Gazette*, that for twenty-five years has been a fine trout stream, and always will be, though running through public lands.

FISH CULTURE IN ILLINOIS—*Jacksonville, Ill., Dec. 3d*, 1879.—The thing uppermost in my mind is the game and fish interest. If only a few of our wealthy men had the same desire as I have, every body of water in this State would abound with good game fish, as I believe there is not a body of water anywhere (that does not dry up) but what there is a good fish that is adapted for it, and if I live long I expect to see my anticipation realized. There is a good deal to be done in this line, and first of all, netting must be stopped in all inland lakes. When a boy in Wisconsin, before nets were put in the lakes, I could catch a mess of good fish with a single hook and line in fifteen to thirty minutes—as much as I could carry. I want to see those times back again. Fish can be raised (where there is water) easier than anything else, but it is useless to tell you anything about this—one who knows so much. G. H.

Sea and River Fishing.

FISH IN SEASON IN DECEMBER.

FRESH WATER.

Black Bass, *Micropterus salmoides*; *M. nigricans*.
Sea Bass, *Sciænops ocellatus*.
Pike or Pickerel, *Esox lucius*.
Yellow Perch, *Perca flavescens*.
White Perch, *Morone americana*.

PRIMITIVE OPINION OF THE GRAYLING.—As an indication of our progress in modern fish lore, we present the following excerpt from an old letter addressed to the Editor of this paper by a Michigan correspondent. It will be perceived that the writer, by his little fling at our references, was actually jealous of the little grayling. Think how much the poor despised creature is talked of and landed now! The letter, which is dated at Detroit, May 12th, 1874, says,—

"The Michigan grayling that you appropriate columns for, is little less than a poor mixture of common perch and herring; little game—a good biter at good bait, but mighty poor at fly."

This does not accord with good Dame Berners, who wrote as follows, as long ago as 1495:—

"The grayllynge, by a nother name callyd ombre, is a delycyous fysshe to man's mouth. And ye may take hym lyke as ye do a troughte."

FISH SWALLOWING FISH.

BOSTON, *Dec. 23d.*

Editor Forest and Stream:—

One pleasant summer afternoon, I was standing upon the shore of a pond, down on Long Island—way down—where Mr. Hallock has, I trow, many times and oft, cast a line, watching the play of swallows as they skimmed just over the surface of the water shortly before sunset. About a hundred yards out was a bed of lily-pads; and as the swallows skirted it, occasionally a good sized ripple could be seen, and sometimes a break from the edges indicating fish there. This fastened my attention to the particular

place. I had often seen cats play with swallows, swooping at them, but the idea of fish doing the same, was something new to me. Presently I saw a clean breach and a fine large pickerel showed his whole size and got his swallow too, as he disappeared beneath the water. This I saw repeated several times, and I called the attention of my companion to this novel sight. While we were watching we saw two large fish break at the same swallow. The fish coming from opposite directions and each head on to each. Both missed the swallow, but singular to relate, only one fish was seen to fall into the water and neither was observed to pass the other. My companion and myself looked with wonder. There was a great commotion in the water, with a continuous spattering, and a boat being handy, we jumped in and rowed to the spot and picked up the largest pond pickerel I ever saw. When we had him in the boat, the mystery was solved; the smaller of the fish had in his eagerness for the swallow jumped clear down the larger one's throat, and only the tail, to the extent of about an inch, showed. The large fish was completely rent asunder and killed by the catastrophy. Both together weighed twenty-two pounds. S.

NEW YORK, *Dec.* 23*d.*

Editor Forest and Stream:—

While trolling in Maumee Bay I caught a twelve-pound pickerel which presented a very rotund appearance. Curiosity prompted me to cut it open, and to my surprise I found within a small pig weighing about six pounds. It had probably been eating snails or fresh-water clams, on the shore, and had ventured into the water after a clam when *Eosx reticulatus* nabbed him most likely to his utter discontent. Piggy was breathing hard and struggling for an aperture for escape, and upon obtaining his liberty ran off with a squeal. THAT OFFICE BOY.

"So young and so untender!"

ROSTON, *Dec.* 15*th.*

Editor Forest and Stream:—

I have had some strange experiences in some of my fishing trips and I submit the following. Perch have very tough mouths, so to save trouble in extracting the hooks I file off the barbs which makes a great difference in the labor. One day last summer, while staying at Manchester, I anchored off Little Misery and putting a hook and sinker on each end of my line, and baiting with a clam, I took a turn round the row-lock with the middle of the line and so was enabled to run two lines at once. The fish didn't bite and I was pretty nearly asleep, when all at once I saw the line moving and before I could catch it, it went where so many California mining stocks have gone before, *i. e.* down.

One week later found me at Nantucket, where one afternoon I was invited to go sharking. We reached the grounds and as soon as I threw my line over I got a bite and soon found I had two fish on my line. I got them on board as soon as possible and at first supposed I had a pair of Siamise twins, but on examination, found that they were connected by a piece of perch line in which my shark hook had caught. We cut them open to investigate and found inside of each a large cod, alive and well. Still we didn't see the end of the line; we then cut the cod open and inside of each cod was a pollock. Still no end to the line. We opened the pollock and found in each a lively perch; we opened the perch and found in each a clam with the shell on, inside of which were my barbless hooks; and now the only strange thing is how the clams could have built new shells in a week's time out of the scanty materials in a fish's stomach, as I am positive I shelled them when I baited the hook. The eight fish weighed 451 lbs. 8½ oz., and we got two pounds of oil from the shark's livers.

T. RUTH.

NEW SHARON, Conn., *12th month, 22d.*

RESPECTED FRIEND:—I have just perused a copy of thy interesting paper and am greatly impressed with the narratives of fishermen, for I, too, am a disciple of that good man, philosopher, and friend, Isaac, whose surname is Walton. Some of those stories were verily marvelous, almost surpassing belief, only that I am assured that thy paper is a reliable one, and I am moved to chronicle something of my own experience. I was angling for trout last Sixth Month, in the waters of the wilderness. And it came to pass, that one day as I was making casts, a passing jaybird appropriated unto himself the fly known as the stretcher, while in the air; and as he was forced upon the water he was seized of a leg by a trout of uncommon size. Yea, his foot was entangled even to the stomach of the fish, where its talons embedded themselves so that the fish was secured. Availing myself of this novel lure I thus captured a goodly string by singles and by pairs; one on either foot, until the hook broke under the strain of a pair unusually large, which left to their own devices, the fish engorged the bird, and then each other. I would have thee, Mr. Editor, advise thy friends to test this method, using a large hook. Yea, a very large hook. Thine in truth,

AMINIDAB OWEN.

COHOES, N. Y., *Dec.* 15*th.*

Editor Forest and Stream:—

Some years ago while angling in the Mohawk, using a small minnow for bait, the fish were not biting freely and I fell asleep in the boat, leaving my line set. When I awoke I thought I would draw it in and rebait. I took hold of it and could not pull it in readily, but after hard tugging brought it to the boat, when I found, as I supposed, a ten-pound pike, fast. After I had landed him in the boat I could not see my hook, so I opened him, when I discovered that an eel about six inches long had taken the minnow a chub had taken the eel; a bass had taken the chub; the pike had taken the bass; in the pike were eight small eels, ten dace, twenty seven fresh-water lobsters, and four good sized frogs. You must shake this dose freely before taking.

HENRY MILLS.

JACKSONVILLE, Fla., *Dec.* 15*th.*

Editor Forest and Stream:—

I am disposed to lend a hand at the bellows. But I rise to a point of order, and enter my protest against the introduction of "gaitors." I maintain that any reference to these posky critters is unparliamentary, and if my position is not sustained, I will favor your readers with not my piscatorial, but alligatorial experience on the Caliasoohatchie River, where I caught with a small line and hook a "gaitor" thirteen feet long. But to piscatorial facts; and I may remark, that your correspondent's statements in your last were not sufficiently fishy, but on the contrary too snakey and gaitery.

In 1866, I indulged in a cruise to the head of Lake Superior. Stopping at Marquette, it at times engaged in the capture of the speckled beauties at the Light-House reef. When the fishermen would come in with their catch of lake trout I would visit the fish-house. On one occasion I noticed that a fish was characterized by corpulency, and directed the attention of the fish-dealer to the fact. He placed the corpulent fish to one side, and when all were housed he started on an exploring expedition. He weighed the aldermanic fish and it turned the scales at thirty-five pounds. Taking an iron rod, (as thick as his finger) with a curved end, he introduced it into the mouth, and from there into the stomach of the fish; and after a few manipulations commenced a long pull, while I made traction at the tail portion of the outside fish. To my surprise there gradually came into the light of day a second fish. It was placed on the scales and found to weigh seven pounds. I tried my hand and removed from the stomach of No. 2 a lake herring weighing three-quarters of a pound which had been used as a bait.

My friend, General S., whose name appeared on so many greenbacks, and who has been accused of using his signature as a bait to catch fish, went fishing on McGerts Creek near this city. But I wish it distinctly understood that he did not use his signature as a bait, but on the contrary one of Mann's spoon. His fifteenth amendment was rowing rather fast, and the General got a bite that nearly yanked him overboard. After a long and desperate fight, he landed a Southern catfish weighing seventeen pounds. I appeal to you, Mr. Editor, to account for the conduct of the aforesaid catfish. As for myself, I believe it to be "a case of mistaken identity."

As an evidence of the popularity of Mann's Spoon Baits, on one occasion I was trolling for channel bass on the Homassassa River and got a strike. To my educated fingers the antics of the fish were strange, and I enquired of myself "why is this thus." To my surprise, when I brought the fish to the side of the boat, I had hooked a three-pound sheepshead. Instead of using a gaff I attempted to lift him into the boat by the hooks, and one of them parted. "Hump," you will probably say this is "a case of mistaken identity." AL FRESCO.

SAINT JOSEPH, Mich., *Dec.* 15*th.*

Editor Forest and Stream:—

I am in want of a big fish-hook, and file my caveat. In 1876 I went to one of our lakes fishing through the ice. I have a small tent painted black, with a small hole in the top to turn out my spear handle, as I only fish in winter with a spear and a decoy fish made of wood. One day I caught a pickerel ff judged to weigh ten pounds. I sent it to St. Joseph at once to T. T. Ransom, who keeps a grocery store. Parties saw the fish, guessed at the weight. On weighing the fish it weighed 13 lbs. 8 oz. The grocery man went to cut it up and spoiled a very nice pocket knife. He then took a hatchet and made an unsuccessful effort to cut the fish in two, until a large farmers' iron drag tooth fell out, which weighed about three and a half pounds, and was ten inches long. What I here state can be proved by T. T. Ransom and a half-dozen other persons in this place, as well a mischievous bachelor landlord who keeps the hotel near the lake. LUTSON.

PUTNAM, Conn., *Dec.* 15*th.*

Editor Forest and Stream:—

As my parents lived near the shore of Plymouth Bay I spent most of my boyhood days shooting and fishing on the water. Almost every one that ever fished in that bay has seen some of the great sharks that abound there. Many years ago there was a monster shark often seen about Gurnet Point, and when a fishing boat came in without any fish they averred that they had been chased by the big shark having thrown overboard all their fish, had barely escaped with their lives. There was a noted boatman, one Joe Salter, who was called the greatest sculler on the coast, and it was said that he once sculled a boat from Rocky Nook to to Goose Point, four miles, in thirty minutes. He had often been chased by the big shark. One time he was out fishing when the monster came for him. He sprang to his oar, but the shark overtook and swallowed him. With great presence of mind he ran his oar out of the shark and sculled himself ashore. G. F. W.

NEAR PEAKE'S CROSS ROAD, Va., *Dec.* 18*th.*

Editor Forest and Stream:—

I forward you a fish story taken from an old work in my possession, and as told on the good people of Galena, Ill. For this reproduction, I demand the "big hook." Failing to receive it, I vow to send you the other method alluded to by the author. Remember my threat and send on the hook, for like old Annanias, you see I have kept back part: "While writing, I may as well tell you of another mode the inhabitants of that comparatively (!) cold region have of taking fish. In warm sunshining days the fish rise up to the surface, probably to catch a look, or to feel the verifying influences of the splendid luminary through their brilliant covering. Their back fins, particularly those of the sunfish, freeze to the ice and the fishermen cut out a piece of it, say five feet wide by ten long, and with a rope slipped over one end they upset the ice, to which vast numbers of fish are found adhering by their back fins. Sleigh loads of them are taken after this fashion, and though inanimate, if put into tepid water they soon revive. This is a cheap and easy way of getting fish, but wants the life and exhilaration of the other." BIRD SHOT.

We fail to see what this has to do with "Fish Swallowing Fish," unless the captors of these fish were land sharks. But we are in suspense for "the other." Send it on.

Natural History.

PARTRIDGE FLIES.—Several of our correspondents have sent us recently specimens of the partridge fly, which was first brought to the notice of sportsmen and identified in the columns of FOREST AND STREAM last year. The specimens are all alike, and belong to the species *Olfersia americana.*

PILEATED WOODPECKER IN CANADA.—Our friend, Mr Ernest D. Wintle, sends us a notice of the capture of a specimen of *Hylotomus pileatus* in Canada, saying:—

I obtained a female pileated woodpecker (*Hylotomus pileatus*) the other day, which was shot near Montreal. Also was informed that the mate bird was sold to some other person. I am told these birds are very rare in Canada.

HAIR WORMS AGAIN.—*Corpus Christi, Tex., Dec.* 8*th.*—In your issue of 13th ult., you published a very interesting article on "Hair Worms," which will go far towards destroying the false impression existing in the minds of many of your readers. I, too, in boyhood's days, believed that horsehairs placed in water became worms, for I had been told so by scores of eye-witnesses who had noted the changes from day to day. I do not doubt but I can find some of those same eye-witnesses now, who would be willing to swear to the statement, for they have told it so many times that they believe it.

This did not satisfy me, however, for every time I soaked a lot of horsehairs in water, they came out as they went in—genuine hairs; so I adopted another theory, viz.: "That hairs, accidentally dropped into ponds, became so rotten as to become the habitation of myriads of animalculæ, which gave a motion to the inert hair, making it appear as possessed of life. This theory vanished years ago, upon reading an article in some paper (yours, perhaps) giving a true history of the reptile or insect, which ever it may be. But now I must ask for a little more light, as I do not see my way clear to accept the theory of reproduction by eggs as you lay it down on page 806. I can only say, that my observation is quite limited; but so far as I do know, "I know it like a preacher."

In the fall of last year I caught one of these "hair worms" or "snakes," in one of the irrigating ditches in San Antonio, in clear, swift running water, trying to make his way up stream, but the current was too strong, and he kept losing ground, being forced tail-foremost down stream. I rescued the fellow, and placed him in a glass tumbler of the same water to see the result. He went round and round that glass a thousand or less times; and I noticed, coming from the after end, a white thread, which soon developed into a full-fledged hair worm about one-third the diameter and length of the parent worm. This I thought queer; but you can imagine my surprise, upon seeing another under way in a few moments, then another, and so on, until I had six worms. The parent, a big black, or dark-brown, worm, and five small white chaps, all alive and hearty. In the course of the day the parent worm died, and, during the night, all of the white little fellows, except one, shared the same fate. I then put this survivor into fresh water to save him, but he lived but an hour. I will state here, that I don't understand where these little chaps could have been stowed, for their combined bulk appeared greater than the parent's. The parent worm after death, appeared as large as before; but upon pinching it, it became perfectly flat, showing that it was hollow. Can you reconcile this with Dr. Leidy's egg system of reproduction? BEXAR.

Dr. Leidy's observations have been confirmed by M. Villot's, and it is altogether improbable that two such accurate and carefully trained observers should have made such grave mistakes as are implied by Bexar's letter. We do not understand that our correspondent subjected his supposed young hair worms to a microscopic examination, and think it possible that what he took for young may have been strings of eggs.

SEA SNAKE CAUGHT IN TELEGRAPH SUBMARINE WIRE.—Mr. Moginie has called upon me with a lovely specimen of a sea snake which he wanted properly mounted in a bottle for the Board room of the Eastern Extension Telegraph Company. One of the cables belonging to this company was being raised from the bottom of the sea, I believe in the Indian Ocean, and when the cable came to the surface, the snake in question was found coiled tightly round the telegraph cable. Luckily it was killed before it could do any mischief, as these sea snakes are excessively poisonous. In the College of Surgeons there is a sea snake which crawled up the anchor chain of a man of war when she was moored in the mouth of the Ganges. The midshipman of the watch saw something moving along the chain, and without thinking, went to pick it up. The venomous brute immediately turned upon him and bit him. The poor young midshipman did not live many hours after the accident. Mr. Moginie's snake is about a yard long, and the general color of it is white, and it is most beautifully marked on the back with black, or rather dark chocolate patterns. The tail is, as in all sea snakes, quite flattened, like the end of an oar. This, of course, gives the animal great power of swimming. My friend, Dr. Day, luckily came in just as I was consulting Sir Joseph Fayrer's magnificent illustrated work on the "Venomous Snakes of the Indian Peninsula," and I am now enabled to give the following account of it by Dr. Day:

"The example of sea snake (*Pelamis bicolor*) which you showed me as having been killed by a deep sea telegraph wire in the Indian Ocean, is a species having a very wide geographical range. I have taken an example in Scinde, another in Orissa, while it is reported to extend throughout the sub-tropical and tropical portions of the Indian Ocean. I have only met with a few examples, and do not look upon it as nearly so common as the blue-banded *Enhydrina*. All these sea snakes, I need scarcely observe, are exceedingly venomous.—*Land and Water.*

If little sea serpents, why not big ones?

THE SOURCES OF THE NIGER.—A great geographical discovery is reported to have been made by two Frenchmen. A telegram from Sierra Leone states that MM. Zweifel and Moustier, representatives of the firm of M. Verminck, of Marseilles, succeeded during September in discovering the sources of the Niger. This great river, which waters the Western Soudan, has hitherto hidden its cradle in the northern spurs of the Kong Mountains, a chain parallel with the Gulf of Guinea and one of the bulwarks of Central Africa. Many explorers had tried to penetrate into these unknown parts, but failed. The French traveler, Caillie, following the Kong Mountains northward, was obliged to content himself with indicating the course of the Upper Niger and its tributaries. Messrs. Laing and Winwood Reade tried in vain to explore the region of the sources of the Diolibah; the mistrust and hostility of the natives forced them to abandon the solution of the problem. A French merchant possessing several stores on the western coast of Africa resolved to attempt the difficult task. M. Verminck chose two of his employees hardened to the climate and accustomed to treating with the natives. He sent them mathematical instruments, books, maps and money, and told them to explore the Niger both from a scientific and commercial point of view. MM. Zweifel and Moustier forthwith left Sierre Leone, followed the course of the Rohelie, and attained the foot of the Kong Mountains. It was here that the greatest difficulty had to be encountered; but they fortunately succeeded in overcoming it. The warlike tribes who had hitherto refused to allow the white man to go farther this time let the two Frenchmen pass the chain and explore the three sources, which, uniting at a short distance, form the great river of the Western Soudan.—*London Standard.*

THE MANATEE AND JAGUAR.

A TERRIFIC ENCOUNTER IN MEXICO.

THE presence of a manatee at the New York Aquarium just now will render the following startling account most interesting. Greater curiosity will also be excited to see the creature. The narrative is contributed by Charles Lanman, Esq., of the Japanese Consulate at Washington, a traveller as well known as Bayard Taylor for the past forty years. It is reprinted from our issue of Oct. 9th, 1873.

While in Mexico I was sauntering one day along the banks of the Panuco River, thirty miles above the city of Tampico, armed with one of Henry's twelve-shooting repeaters, taking an occasional shot at the alligators basking open-mouthed on the sand bars, when I observed a great commotion in the river several hundred yards below me. I saw a dark mass slowly rise from the water and creep along the shore toward a small pond made by the overflow. It was a very large Manatee, or River Cow—a very large one, indeed. The height of my ambition was to kill one of these monsters, and although I had repeatedly shot at them, I always failed to secure my game. I immediately hastened toward the manatee, walking very cautiously, for their hearing is very acute, and succeeded in approaching within three hundred yards, when I was much startled at seeing some animal creeping cautiously toward the shore, where the manatee had landed. I thought at that time it must be a large dog, but its movements were too stealthy, too cat-like. I was at fault. A wolf it could not be, for none existed in that part of the country. It crept so low in the grass that I could not decide what it was. Remembering that I carried a small opera-glass in my pocket I stopped and adjusted it, but on account of the height of the grass I could only occasionally see the animal. Its intention was plainly to intercept the manatee's retreat. Every time the cow raised its head the animal would crouch, and when it began feeding on the lily-pads it slowly advanced. I resolved to approach nearer, and with great caution and fatigue reached a small clump of trees about eighty yards from the manatee and about one hundred and twenty from its assailant, for there was now no doubt of its purpose. A bare piece of sand intervened between the two animals. Fixing my glass I awaited with great excitement the approach of the attacking party. Slowly would it creep—so slowly that minutes seemed hours. At last, at the edge of the sand-belt, I saw it crouch low and remain immovable at least five minutes, and then in two tremendous bounds it crossed the open space and sank as if shot in the bushes beyond. I saw it well. It was the dreaded tiger of the coast, the jaguar. A thrill ran through me and I could not help looking behind to see if his mate was not attacking me, but the interest was too great as to what was passing in front. Slight as must have been the noise made by the jaguar, it had evidently alarmed the manatee. It made rapidly for the river; but on passing near the jaguar, with a terrific roar which shook the very ground, it leaped on the head of the unhappy cow. Then began a struggle of which I could see but little. The roaring and snarling of the jaguar were frightful to hear, and the bellowing of the manatee incessant for at least ten minutes. Clouds of dust enveloped them, the cow evidently making desperate efforts to reach the water and the jaguar trying to prevent it. At last the bellowing and screeching ceased entirely, the dust settled, the poor cow was flapping its tail in its death agony; and the jaguar seated on its haunches seemed to be contemplating its victim, almost touching it. At this moment the jaguar made a motion and gave a piercing shriek, dragging itself with its fore paws, the hind limbs hanging behind motionless. Another moment and another howl; its spine was broken! In the struggle, or during the death agony of the manatee, it had fallen on the tiger and crushed him. Slowly he dragged himself along, groaning at every movement, to the edge of the pond, and drank copiously and laid down in evident pain.

I now determined to draw near, and with my rifle ready approached the helpless beast. He soon heard my steps, and rose again to a sitting posture, roaring loudly and showing his teeth, but no evidence of fear, only rage, and then lay with his head between his paws, watching my movements. I advanced to within forty yards, when he rose suddenly and tried to spring toward me, falling some five feet forward. I stopped, wishing to come no nearer than necessary. He crouched again, and almost fascinated me with his intense gaze. I looked at him with every nerve strung, expecting another attack, but his eyes alone moved like coals of fire. I advanced about fifteen steps more, when he made another fruitless attempt to leap. I turned on one side, but no movement of his followed. Until I got behind him he seemed doggedly resigned to his fate. I shouted, and he deliberately turned his head to look about. I raised my rifle, and aiming at the glowing eye, fired. No movement on his part betrayed he was struck, and as I again aimed at him a spurt of blood gushed from his mouth; he turned over, tearing the earth and grass, and in no less than a minute was dead. I now had leisure to examine the animals. The head of the manatee was almost entirely bitten off, the brains scattered in every direction, and eyes clawed out by the jaguar. One of the fins or arms was bitten entirely off, but on the body but few marks of its adversary's claws or teeth were visible. It measured eighteen feet in length, and its girth was about twelve feet. The mammæ were well developed, showing that it had a sucking calf. The hide in color resembled that of the elephant, only a little greener, and the head was ridiculously small compared to the size of the body. I now turned to the jaguar. He was also very large and beautifully spotted; his teeth were large and his claws very sharp and curved. He measured eight feet from tip to tip, as slim and long as a greyhound; but the diameter of his paws revealed the muscles of steel which lay within. He was about three feet eight inches in height, four of the fangs were two inches long, his head and skin were much scarred, and one of his ears was bitten off.

At this moment two rancheros rode up, but as soon as the horses had a smell of the jaguar they shied and refused to advance, and nothing but the matchless skill of the riders saved them from being unhorsed. I sent one to the town of Panuco to inform my friends, and in an hour more than three hundred people had assembled. The jaguar was bodily carried into a canoe, and the manatee with great difficulty rolled into the river and floated between two large canoes, sixty feet long, with ropes to prevent its sinking, the horsemen following along the banks yelling and firing off their muskets. They arrived at Panuco, about three miles distant, in perfect triumph, and for three days the jaguar, and above all, the manatee, were the wonder of the surrounding country.

CHARLES LANMAN.

THE FLORIDA CROCODILE.

(*C. acutus.*)

A CAREFUL observer of Florida alligators, who signs himself "Wanderer," in an article which appeared in the FOREST AND STREAM of Dec. 4th, last year, says: "We have three species of alligators, differing from each other in the following manner. The black alligator is short, very large for his length, and inhabits principally lakes, ponds, sluggish streams, and lives or has his home in holes that he makes in the banks near the water's edge, and often the entrance is under the water. Next is the brown alligator, long, slim, and very swift and active, and much straighter from his eyes to tip of nose than the black. He lies at the bottom, in deep holes and under shelving rocks and sandbanks, and inhabits the running streams and along the beach. The next is similar to the brown, differing only in shape of head, lower tusks, protruding through upper jaw when his mouth is closed. I only saw one of these. J. M. Galpin killed him at the mouth of Arch Creek, on Key Biscane Bay, measuring only eight feet."

The last saurian described by "Wanderer" is not an alligator, but is a specimen of the true crocodile *C. acutus*. As but few of your readers are probably aware that Florida is the home of the crocodile as well as of the alligator (*A. Mississippiensis*) you will pardon me for quoting a few lines upon that interesting reptile from my recently published book, "Four Months in a Sneak-Box: a boat voyage of 2,600 miles down the Ohio and Mississippi rivers, and along the Gulf of Mexico."

"There is much interest connected with the discovery of the true crocodile, (*C. acutus*) in the Floridian peninsular. While the alligators have broader heads, shorter snouts, and more numerous teeth than the crocodiles, the unscientific hunter can at once identify the true crocodile by two holes in the upper jaw, into which and through which the two principal teeth or tusks of the lower jaw protrude, and can be seen by looking down upon the head of the animal. The largest teeth of the alligator do not thus protrude through the head or snout, but fit into sockets in the upper jaw. I first studied the true crocodile in the island of Cuba, where there are two distinct species of the genus, one of which is our Florida species (*C. acutus*). At that time science was blind to the fact that the crocodile was a member of the fauna of the United States. At a meeting of 'the Boston Society of Natural History,' held May 19th, 1869, the late comparative anatomist, Dr. Jeffries Wyman, exhibited the head of a crocodile (*C. acutus*) which had been sent him by William H. Hunt, Esq., of Miami River, which stream flows out of the everglades and empties into Key Biscayene Bay, at the southeastern end of the Floridian peninsular.

A second cranium of the sharped-nosed crocodile was afterwards obtained from the same locality, but the honor of killing and recognizing one of these huge monsters, belongs to the young and enterprising author of the "Birds or Florida." I refer to Mr. C. J. Maynard, of Newtonville, Mass., who has furnished me with a graphic description of his meeting with, and the capture of, the crocodile, while engaged in his ornithological pursuits during the year 1867.

As the same account was also furnished to the author or compiler of that valuable work, "Camp Life in Florida," which was published by the Forest and Stream Publishing Co., and is somewhat lengthy, I will omit it here; and will only add that a naturalist from Rochester, N. Y., afterwards captured a crocodile in South Florida, and attempted to make a new species of it by giving it the specific name of *Floridanus*, in place of the older one of *C. acutus*.

The notes furnished by "Wanderer" are exceedingly interesting and valuable. The black and the brown specimens described by him are probably varieties, not species, of the *A. Mississippiensis*. However, as we were not aware, a few years since, that we had a crocodile in our fauna, we may perhaps have two species of alligators in Florida. I have observed that there is a decided difference between the black and brown alligators described by "Wanderer," but never supposed these differences would separate them into two distinct species. Will not "Wanderer" favor us with more of his observations on the Florida fauna? NATHANIEL H. BISHOP.

Lake George, Warren Co., N. Y.

AN ALLIGATOR ASTRAY.—*Indianapolis, Ind.—Editor Forest and Stream:*—Of course, mine is a true story; but to make it perfectly clear to you, I desire to say that on three separate occasions I saw an alligator in Whiteley's Hole, on the Leona, although I never heard of the oldest inhabitant seeing one in that locality before. The Leona empties into the Indiana, the latter into the San Antonia River, which empties into a small bay on the Gulf coast. The reptile must have been at least one hundred miles from his native spot, and how he got there has always been a great mystery to me. GRINGO.

FOOD OF FROGS.—*Sing Sing, N. Y., Dec. 6th.*—I saw in your issue of Dec. 4th a note giving the bill of fare of the frog. It reminded me of a more extensive one of fish, flesh and fowl, which I have found, while dissecting the frog, in the past few years. In an old veteran, which measured sixteen inches long, and was killed in a mill pond, I found a full-fledged oriole (*Icterus baltimore*). I suppose the bird had hopped down to the water to drink, when it was seized by the hidden frog. In a frog that I killed in a wet meadow I found three meadow mice (*Arvicolæ*). Of two more which were killed in a large pond, one contained five minnows (each about two and a half inches long); the other three minnows and a large water-bug (*Belostoma*). Of two that were killed near Croton Lake, in one I found a water-thrush (*Seiurus motacilla*), and in the other a small striped snake, six inches long, A. K. FISHER, M. D.

THE NORTHERN WAXWING IN IOWA.—*Ames, Iowa, Dec. 22d.*—In your issue of December 18th, T. S. Roberts notes the appearance of the Bohemian waxwing (*Ampelis garrulus*, in Minnesota. The bird has also been seen here in considerable numbers. I find in my notes that I shot two specimens on November 21st, and I have since seen several flocks. I have also received a specimen from Denison, in this State. They appear to be feeding upon the berries of the smilax or green-brier. F. E. L. BEAL.

THE ORIGIN OF THE TURKEY.

BY ELLIOTT COUES, U. S. A.

THERE is no longer the slightest doubt that the domestic turkey is descended from the wild bird of Mexico lately named *Meleagris Mexicana* by Gould. It was upon this bird, and not upon the feral race which inhabits the United States at large, that the Linnæan name of *Meleagris gallopavo* was bestowed.

The most satisfactory account of the introduction of the bird into Europe, and of its early history there that I have seen, is given by Mr. Edward T. Bennett, in his beautiful work entitled "The Gardens and Menagerie of the Zoölogical Society Delineated" (p. 209 of vol. ii, 1831). Mr. Bennett justly remarks upon the curious circumstance that the bird, now known for three centuries, should have been doubtful for more than two hundred years—its very *patria* unknown or erroneously attributed to it, and itself wrongly supposed to have been a bird known to the ancients under the name of *Meleagris*. Most writers of the sixteenth and seventeenth centuries, among them Belon and Aldrovandi, thought that it came from Africa or from the Levant, and confounded it with the guinea fowl, as minutely described by Athanæus and other classic authors. Mr. Bennett states that the French academicians first called attention to the circumstance, and that Daines Barrington, in 1781, was the last person to uphold the groundless notion.

A more needless blunder, of greater tenacity and obduracy, is not to be found in the annals of our science. The Μελεαγρις of the Greeks, or *Meleagris* of the Latin, was the African guinea fowl, *Numida Meleagris* of Linnæus. Aristotle, indeed, mentions it only in the briefest terms possible; but Pliny, though very unsatisfactory in his description, says explicitly that the *Meleagris* was an African bird. Athanæus, however, gives a sufficient description from a work of Clytus Milesius, a pupil of Aristotle, leaving no doubt which the *Meleagris* was. Gesner recognized the bird in the guinea fowl, but his contemporary, Belon, supposed the turkey to be meant; the former named the turkey *Gallopavo*, and Linnæus, two centuries later, adopted this name as the specific term of his *Meleagris gallopavo*, thus transferring the ancient name of the guinea fowl to the turkey.*

Linnæus, however, knew perfectly well that the turkey was American. He says distinctly: "Habitat in America septentrionali," and quotes as his first reference (after Fn. Svec. 198) the Gallo-pavo sylvestris *novæ angliæ*, or New England wild turkey of Ray. Brisson distinguishes the two perfectly, giving an elaborate description, a copious synonymy and a figure of each; and from about this time it may be considered that the history of the two birds, so widely diverse, was finally disentangled, and the proper habitat ascribed to each.

To return to Mr. Bennett's article, from which what here follows is almost entirely extracted:—It is known neither by whom nor at what precise period the turkey was first brought to Europe; but it may be reasonably presumed that it was introduced by the Spaniards from Mexico. The earliest description of the bird is said to be that given by Oveido, in his "Natural History of the Indies," where it is mentioned as a kind of peacock found in New Spain, whence it had been transported in numbers to the islands and the Spanish Main, and there domesticated. Mexico was discovered by Grijalva in 1518; Oveido's work was published at Toledo in 1526; this author's account proves, therefore, that the turkey was domesticated prior to the latter date. It is also described by Gomarra and Hernandez as indigenous to that country, and the latter writer distinguishes the tamed birds from the wild.

The turkey thus domesticated by the Spaniards seems to have directly found its way to England, through the close intercourse then subsisting between the two great maritime nations; though it is curious to observe that no trace of the fact remains either in the name of the bird or in popular tradition. "On the other hand, it is barely possible that it may have been brought directly from America to England by Cabot, who made such extensive discoveries on the coast of the newly found continent. According to a popular rhyme, quoted by Baker in his Chronicle,

'Turkeys, carps, hoppes, piccarel and beer,
Came into England all in one year,'

which remarkable year is said to have been about the fifteenth of King Henry the Eighth, or 1524." Barnaby Googe, a writer on husbandry in 1614, says that "those outlandish birds called giuny cocks and turkey cocks" were not seen in England before 1530; but derives the statement from Heresbach, a German author.

According to Hakluyt, in certain papers dating 1582, turkeys had been brought to England about fifty years previously. "We may, therefore, fairly conclude that they became known in this country about the year 1530. Why they were denominated turkeys, an appellation which bears no resemblance to their name in any other language, we have no probable grounds even for conjecture. Willoughby supposes the name to be derived from a notion that they were brought from Turkey. Such an erroneous opinion may possibly have arisen from that confusion which appears to have at first existed between them and the guinea fowls, the latter being probably commonly obtained from the Levant, and being also in the sixteenth century, exceedingly rare in England." The turkey, on the contrary speedily became a common bird of the poultry yard and a standing dish at festivals. There are statutes respecting its use for the table dating 1541 and 1555, and it was so plentiful in 1573 that it was then, as it has ever since continued to be, the usual Christmas dinner.

* cf. Sundev., Thierarten Arist, p. 139, 1863.

Mr. Bennett ascribes to one Pierre Gilles the credit of having first described the turkey in France, in an edition of Ælian which he published in 1535, and where occurs a description so true that it was relied upon almost entirely by subsequent writers down to Willoughby. Gilles speaks of it as a bird he had himself seen, and as one brought from the New World. That it was known in France at this period is further shown in a treatise by Champier, published in 1560, but said to have been composed thirty years before, in which the bird is stated to have been brought from the newly-discovered Indian Isles a few years before.

"From this time forward their origin seems to have been entirely forgotten, and for the next two centuries we meet with little else in the writings of ornithologists concerning them, than an accumulation of citations from the ancients, which bear no manner of relation to them. In the year 1566 a present of twelve turkeys was thought not unworthy of being offered by the municipality of Amiens to their king; at whose marriage, in 1570, Anderson states, in his "History of Commerce," but we know not on what authority, they were first eaten in France. Heresbach, as we have seen before, asserts that they were introduced into Germany about 1530; and a sumptuary law made at Venice in 1557, quoted by Zanoni, particularizes the tables at which they were permitted to be served.

"So ungrateful are mankind for the most important benefits that not even a traditionary vestige remains of the men by whom, or the country from whence this most useful bird was introduced into any European state."

The Kennel.

TENNESSEE FOX HUNTING.—The fox hunters of Nashville usually go out in the night; but for Christmas week a grand fox chase was planned to be run in the daytime. There is much to be said in favor of both modes, but it is probable that hunting by daylight will in a measure supercede the night hunting. Foxes are very abundant this winter and have not been chased much.

KENNEL HINTS.

THATCHING FOR KENNELS.

A well-thatched kennel is cool in summer and warm and snug in winter. Heather makes the best and neatest thatch, but straw and rushes are both good.

FLOORING AND THATCHING.

The flooring and thatching of kennels is a subject of no small importance to every one who wishes to maintain his dogs in a state of health. We have tried all kinds of flooring, and our experience is as follows:—Earthen or gravel floors are cold, comfortless, and difficult to keep clean; bricks are also cold, and they absorb deleterious matter; a brick-floored kennel where disease had been for any time would be difficult to render safe from future outbreaks; wood is comfortable, but retains moisture; asphalt objectionable in the extreme; well grouted and slightly roughened black tiles make an excellent flooring, but they are somewhat expensive; so we fall back upon a floor, the foundation of which is broken bricks or small stones, plastered over with any kind of cement that will harden quickly and well. Slates make a cold though cleanly roofing for kennels; tiles are better, and if they are nailed upon the boards, with a layer of hay between, they make a roof that is as cool in summer and as cosy in winter as one can wish. Of course, heather thatch is far the best roofing, when it can be got; but you cannot well collect the rain water from it as you may from tiles, and this is a great object in a large kennel.

WATER FOR KENNELS.

Some of our readers are contemplating the building of kennels, and we beg to remind them that, next to the site and kind of soil on which they are to stand, the quantity and quality of the water ranks in importance. For drinking purposes hard water will do well, but it cannot be too pure. The price of sinking an Abyssinian well is only seven pounds. In addition to this, water for washing the dogs, etc., should be collected from the roofs, by means of spouts along the eaves, but these should discharge their contents into a wooden, not a zinc tank, or the water will be hard.

MANGE.

Cases of this troublesome disease continue to flow in upon us. The green iodide of mercury ointment is by some considered a specific in the disease. We prefer mixing it with equal parts of compound sulphur ointment, and dressing after washing thrice a week. But in almost every case a tonic should be given, any tonic except iron, which is somewhat heating. The reader should remember that in nine cases out of ten mangy dogs are poor in blood, the food should therefore be abundant, and contain horseflesh, mutton (sheep's head), and a good supply of vegetables.

VARIOUS.

Give plenty of exercise during dry cold weather. Let short-haired dogs wear their jackets out of doors, especially if it rains. Rub long-haired dogs well down if they are wet. Give oaten straw for bedding. Keep puppies separate from older dogs, and you will save the straw.—X. PERIENCE, in *Live Stock Journal*.

SHORT-TAILED DOGS.—*Dec. 16th.*—It has been my fortune, during eight years to have forty-five pups dropped by dams of my own, and to see thirty-two, that I can now think of, which were sired by my dogs. Of the forty-five, twenty-three have been bob-tailed, the tails being from *nil* to eight inches long. Of those sired by dogs of my kennel and out of females owned by others, the proportion of stumps has been about the same. The breeds are as follows:—1. Thoroughbred English pointer dog and bitch—three litters of pups. 2. Cross between same pointer and English setter bitch. 3. Cross between son of first pair and a fine Gordon setter (accident). 4. Black-and-tan terrier (three inches bobtail), by a Mexican hairless dog (also an accident). 5. Same, lined by a large-sized pointer of my own (carlessness of servant). 6. Same terrier bitch, by some unknown dog—a cur, probably (pups all white). 7. A litter of thirteen, out of a red setter bitch (pedigree not fully known), by one of my English pointers.

Now, in every one of these litters there have been short tails, from one to nine in each, and two of the pointers and one terrier-cross, had absolutely no tails at all. One of them showed a slight cavity, where the tail "ought to grow." Suffice it to say, further, that the English pointers have tails that appear to have been docked, but they are natural; they were born thus. The same is true of the black and tan, which, by the way, had neither brother nor sister. Not long hence we may know whether my stock will carry this peculiarity to the third generation.

I might adopt the *nom-de-plume* of "Caudal Appendage," but it is not euphonious, and will simply subscribe myself, YOURS TRULY.

A REMARKABLE DOG STORY.—The following narrative of facts was contributed to the New York *Sun*, Aug. 3d. It surpasses anything of a like nature we have ever seen:—

My eldest brother, a farmer, lives in the western part of Pennsylvania, and among the outfits of his establishment was a black and tan dog of uncommon sagacity. At the outbreak of the war of the rebellion two of my brother's sons, mere boys, joined the Army of the Potomac. In an angle of the public road in front of his house was a considerable mound, formed of the waste of many wood-piles for successive years. From this angle the road trended southward, and by it the boys went forth to join their regiment. Seated on that mound Priam—that was the dog's name, silently watched their departure until they were lost to view in the distance. Then he went back to his lair, and there he lay for many days, unusually quiet and evidently sorrowing. After a month or more had passed in this way, one day Priam ran out from his seclusion, took his place on that mound, and facing southwardly cried like a human being in distress for about two hours. Then he went back to his lair and was quiet. Some days afterwards letters from the boys were received. They were in a battle at the time of the dog's demonstration, but came through unhurt.

These contemporary facts were strange suggestions to the family that Priam possessed some quality of knowing those different occurrences at the time of them; but still it was too unlikely for belief just then. His strange behavior on that day was, however, substantially repeated during every subsequent battle in which the boys participated until they ended their lives in the Andersonville prison pen.

The dog's last outburst of lamentation was nearly continuous from the beginning of the battle in which the lads were captured until their death. After this Priam became exceedingly surly and cross to all comers. No matter how near a neighbor lived, or how well known, the dog denied the neighbor entrance to the premises, until called off by one of the family.

In 1869 I visited my brother for the first time in forty-two years. Of course I was as a total stranger to all of them. The family knew of me only by hearsay. The dog knew nothing, unless, indeed, he understood what was said by the family when I happened to be their theme. My expected visit about that time doubtless gave me a prominence in that particular which multiplied his opportunities of learning something about me; and if he knew what they said, he was equally prepared with them to expect me.

As I walked down the lane to my brother's house I noticed a dog (it was Priam) looking me square in the face over the gate. Without hesitation I unfastened and went inside. The dog turned and trotted up the steps before me, gently wagging his tail, and occasionally looking back at me as though to see whether I understood him and was coming. The front door being open, he led the way through the house to one of the back doors, and there we found an elderly lady, my brother's wife. Forgetting the dog in the greetings, I did not notice how or when he went out. But soon afterward I saw him at the front gate again, as when I approached it. This single and isolated suspension of his surly aggressiveness, in letting me, a total stranger, enter the premises unchallenged, furnished another theme for publication as to its meaning, and the conclusion was that Priam recognized in my countenance, which he had scanned so closely, a relative of his master's family.

Now how are we to account for the more than human sagacity of Priam in all that, and especially in his synchronous lamentations with the battle in which his two young masters participated, and never a false alarm nor an omission? W. J. C.

Keokuk, Iowa, 1879.

NAMES CLAIMED.—Mr. B. F. Dorrance, of Wilkesbarre, Penn., claims the name of Gaie for his red Irish bitch puppy, Elcho-Firefly, presented to him by H. W. Gause, Esq., Wilmington, Del. B. F. DORRANCE.

—Mr. H. W. Gause, of Wilmington, Del., claims the name of Saxon, blue Belton dog, Belle-Carlowitz, and Kildare, red Irish, Firefly-Elcho.

BRED.—*Brooklyn, N. Y., Dec. 22d.*—Mr. Joseph E. Fisher's Gordon setter bitch, Border Lily, to Dr. H. F. Aten's champion Gordon dog, Glen, winner of the Brace stakes of the Eastern Field Trials, 1879.

—Mr. Robert Walker, of Franklin, N. Y., has bred his pointer bitch, Clare, (Button-Topsy, Phil-Fannie) to Godeffroy's imported Croxteth. D. F. S.

WHELPS.—*London, Ont., Dec. 20th.*—Dr. Nevin's Gordon setter, Mall, whelped eight puppies, six dogs, two bitches, sired by owner's Blossom. Blossom has been taken by Vera Shaw in his new book, as the colored illustration for the Gordon setter. J. W.

RAY.—Mr. Henry W. Livingston, of New York, has purchased from Mr. Edmund Orgill the English setter dog, Ray, by Mr. Charles H. Raymond's Pride of the Border, out of his Dimity.

—The recession of the water in Tulare Lake, Cal., has uncovered a prehistoric settlement, stone buildings, traces of canals once bordered with planted trees, and other evidences of occupation by an unknown race, being clearly defined as the water subsides.

Furz and Trapping.

HOW LINNETS AND GOLDFINCHES ARE CAPTURED ALONG THE ENGLISH COAST.

THE trade of bird catching is just now carried on with great vigor all along the south coast line. Our almanacs tell us when grouse shooting begins and when partridge shooting ends, but they are silent as to such very insignificant birds as mere linnets, larks, goldfinches and red polls. And yet trade is brisk in these very small commercial commodities, so brisk that the Southeastern Railway has a special tariff and carries up these unfortunate songsters by the score from the breezy downs of Kent and Sussex to the dreary purlieus of Eastcheap and St. Giles', where about seventy per cent of them dwindle miserably, pine and die. The spruce little cock goldfinch, twittering gaily in his cage, cracking hemp seed between his powerful mandibles and pecking at thistle down and groundsel, is handsome and happy, but he is one of five-and-thirty, and the other thirty-four have been flung out into the street with the rest of the refuse of the bird shop.

COBBLERS AND CALL-BIRDS.

We have called the birdcatchers' occupation a trade, but the tradesman would require some other means of money-making to enable him to live comfortably throughout the year. The season, or as he calls it, the flight has not long been commenced, and will very soon be over. It scarcely lasts more than a month, and the other eleven have to be filled in. He generally fills them in with shoemaking. It is quite remarkable to see the sympathy that prevails between cobblers and call-birds. Charles Dickens found in his experience that barbers were great fanciers of the smaller kinds of singing birds. But it is one thing to keep birds and another thing to catch them. The barber's cage hangs in his little snuggery all day and all night. At half-past four in the morning the cobbler gets his all together, packs them up with his nets, his boxes, and his switches, and starts off before dawn to the scene of his labors. He has to be on the ground before dawn, and probably will not be able to see the plumage of the first bird he catches.

THE FLIGHT OF BIRDS.

For the flight of birds is a curious thing, and his own experience leads him to know that it is a reliable thing. Year after year their course takes them over the same fields, across the same track of downs and grassy levels, till they reach that point on the coast where for years they have crossed the Channel, and for generations will continue to do so. And so it happens that a particular field will be an admirable spot upon which to commence operations, so that the birds will pertinaciously resort to it and avoid all the neighboring ground as if it were an unfashionable district in a London suburb. And this is so well known in the trade that one reason why our cobbler must rise so early is that if he is late he will find the place already occupied. Let us suppose him in good time, and watch him making his preparations, and see in what they result. He chooses his ground on the cliff, and generally rather inland. If there are a few furze bushes close at hand, or a thorn hedge, why it is so much the better, but these are matters of detail on which he does not insist. What is important is that the flight passes over these fields. The first thing is to spread out his nets. They lie on the ground framed with wood, like a pair of gigantic folding-doors, and the simile is rendered more applicable as they turn on hinges and open and shut. As they lie open, a space of clear turf intervenes, and when they rise and fall it is that space which they cover. The sportsman is himself able to effect his manœuvre by merely pulling a cord. As he pulls, the doors rise, overlap, and fall. It is an affair of a moment, and the result is never doubtful. That is, of course, if he has been successful in bringing the birds down from their flight overhead to this special patch of turf. And for that he accordingly makes arrangements. They are generally very simple.

IN AMBUSH.

First he spreads his call-birds all about the field—larks, linnets and goldfinches, for he never can tell what luck may be in store for him, or what prey he may take in his toils. Next he sees to the nets themselves. He, in effect baits them with brace-birds. A brace-bird is one of the few technical terms in the business. It looks uncommonly like a piece of cruelty, but probably is not. The little bird seems to have a swivel screwed into its back-bone, in which a ring is inserted by which it can be tied. In reality a wire is passed round and round its body and under its wings, near the joint, and this wire is joined and twisted at the blade-bone, and a little ring added, so that the bird can be securely tied and yet its wings are free to let it fly as high and as far as its tether will permit. These brace-birds are all good songsters, and free with their minstrelsy. They must not have either sulks or colds. A peg is next driven into the ground from which it rises about eighteen inches, and a long switch hinges on to the top of this peg, at right angles to it. The structure, in fact, looks like a miniature gallows, only that the transverse switch is very long, and is allowed to hang on to the ground. To the end of this switch the brace-bird—linnet, lark or goldfinch, as the case may be—is tied, and it has generally tether enough to run about on the ground and enjoy the novelty of a fresh sod. But the sportsman can in a moment, by pulling a bit of string, bring the switch into its place, a process which jerks up the unfortunate brace-bird, who flutters high into the air, and finally descends in great distress on its only available perch—the switch. This apparatus, with a bunch of thistles laden with down for the goldfinches, the nets themselves, and a long, low cage for his captives, constitutes the whole stock in trade. Our sportsman lays out the nets, sets up the gallows, and retires a short distance in ambush for his prey.

THE CATCH.

A whole troop of innocent linnets, full of life and song and with their minds fully made up to roost in Brittany that night, now sweep through the air overhead. They have passed the field and are out of danger. So at least you think, but the sportsman knows his business better. Before they are quite out of call he sets up a peculiar whistle which makes all the little birds in the cages

The W
demonstratively vocal. They pipe desperately to their friends in the air, and the appeal is answered. You shall see the whole flock swerve round in their course, and, for a moment, hover over the nets. Then the other cords are pulled and the little brace-birds flutter up into the air in great distress. No properly constituted flock of linnets can resist the temptation of coming to the rescue, and before they reach the ground the nets are over them, and in a minute half of them have had their brains driven in by the sportsmen. For his time is valuable, and where one flight has passed another may be expected. So he rushes quickly to the ground where the little creatures are plunging and struggling under the net work, kills all the hens and extricates all the cocks, flings the nets open again, and is back in a moment at his post. He stuffs the cock birds in the long cage and occupies his leisure in pulling the feathers out of the yet warm bodies of the hens.

DISPOSING OF THE PREY.

The cock linnets are sent up that night to town, and are taken as a lot by the dealer at Seven Dials at 1s. a dozen. The hens are sold to the poulterers, who retail them as larks to a voracious but unsuspecting public. Goldfinches fetch much higher prices. Cocks and hens are sold at eight, nine or ten shillings a dozen all round, and larks fetch much the same price. The retail dealer has to calculate the probabilities, and though he sells his linnets ultimately at half-a-crown each, and his goldfinches at from three-and-six to five shillings, yet casualties sweep off the greater part of his profit. Certainly his continued residence at Seven Dials shows that the man must either drive a very unremunerative trade or else be singularly dull to the advantages of fresh air and general cleanliness.—*London Queen.*

Women's Column.

THE CARE OF ARROWS.

SEVERAL correspondents having mistaken the purport of a sentence in my late article upon winter practice, wherein I spoke of arrows being lost in the snow, and coming to light in the spring, I beg to say that I did not intend to convey the idea that such arrows were ever used afterward. On the contrary, I can say emphatically, that so far as my experience goes, an arrow is ruined by lying out in the dew for a single night. I say ruined, because the effort to mend an arrow is always abortive unless the mender is an arrow maker of great skill. It is much more difficult to mend than to make an arrow. The reasons are, that in making one the fletcher has a large billet to work down and can force matters, while if the stele is warped by the sun it is next to impossible to get it to retain a true form afterward. Again, the hard wood footing is glued on while in the block and afterwards worked down to the requisite size, and if loosened by damp it is extremely difficult to again put the parts together perfectly. The same is true of the horn nock. If the damp causes the feathers to come off it is equally difficult to readjust them. The shooter, if only a beginner, is liable to be deceived by his success in scoring with arrows thus cobbled, for at distances from twenty to fifty yards a strong bow will drive a poorly fledged arrow so quickly to the target that the eye of an old archer only would discover its erratic flight. Indeed, so little will even a very poor arrow leave a direct line in a distance of forty yards from a fifty-five pound bow, that one can score pretty nearly as well with them as with much better ones. Of course there would be a strong percentage always in favor of the best arrows when any great number of shots was made, but the archer would not probably notice it in a single score.

As the distance is increased, however, the disparity between the good arrow and the bad one increases in a disproportionate progression. If the percentage of the good over the bad arrow at forty yards were five points in one hundred, at sixty yards it might be twenty, at eighty yards seventy, and at one hundred yards the value of the poor arrow utterly cease, since it would never follow the aim, and would only strike the target when aimed wrong, a measure of success which no good archer would covet. This being true, I could never advise the mending of an arrow, unless it were some trifling injury to be remedied, such as resetting a loose pile, dressing an injured nock or pile, or gluing down a partially started feather. It is a positive injury to the archer to practise with an arrow which is defective. All good arrows shoot alike, but no two bad ones do. So the archer who has a dozen good arrows has only to learn to shoot well with one in order to succeed with the whole dozen, but the archer who has twelve bad ones must learn the particular vice of each in order to shoot with the dozen. He must always remember that No. 1 shoots too high, No. 2 to the right, No. 3 to the left, No. 4 too low, No. 5 too high, and to the right both, and that each of the others has one of these vices, and perhaps all of them troubled with general cussedness besides. These traits will not be noticed so much, as before remarked, at short range, or by the beginner, but to the veteran who tackles the York round they are a scorn and a loathing. What is true of injured or cobbled arrows which once were good, is equally true of cheap arrows which never were good. The archer should never heed the wiles of the clerk in the archery store, who swears to the excellence of the arrows which he offers at $5 per dozen, for no one can make a target arrow fit to be shot at an honest-faced target for any such price.

The best arrows command from $10 to $12 per dozen, and if properly used a dozen will last an archer through one season, even if he shall shoot six thousand times. Now a few points as to the care of arrows. First, your target being supported by an easel, you will occasionally break an arrow on the leg. In order to obviate this evil, make your easel of some strong wood like hickory, or better, of iron, so that the legs may be small, and wrap the legs from end to end with old carpet, rags, or untwisted rope, hemp, or tow, and you will never break an arrow on the target stand. Next, do not place your stands, if possible to avoid it, upon ground where there are stones, or in range with stumps, trees or any other like obstruction. If you cannot have butts of earth erected behind your targets, a strong piece of sail cloth suspended from a cross beam upon two poles in the rear of the targets will answer excellently. By these devices half the arrows actually ruined will be saved. Very few arrows are ever worn out. The writer has two arrows which have done faithful service through the past season, having been shot perhaps one thousand times each, and are as good as new, with the exception that they are flattened a little at the side which slides upon the bow, and the two feathers sliding upon the bow are frayed a trifle. The other ten of the same dozen were all broken by striking target stands, stones and fences, or were ruined by being lost under the grass. Since I have wrapped the legs of my target stand I break no more, and the butt or sail cloth would have prevented the loss of those passing the target and snaking. Another fruitful source of injury to arrows is that of leaning them against a wall when not in use. They will warp by their own weight in a few days and their efficacy be destroyed. Some have recommended to lay them flat on a floor or on the bottom of a drawer, but the feathers are thus crushed and the flight of such an arrow will be erratic. When not in rest they should stand exactly upright in a case, each arrow in a hole to itself, and far enough apart to prevent any contact of the feathers. Let no novice imagine that such extreme care is unnecessary, or that he can do well enough with arrows which are slightly defective, for one might as well expect to shoot well with a rifle having a crooked barrel and a loose and shaking peep sight, as to send a crooked and misshappen arrow, with its slovenly tuft of rumpled feathers, vagabondizing in quest of coveted but unattainable gold. WILL H. THOMPSON.

SHE GOES FISHING.

CHICAGO, *Nov. 27th*, 1879.

Every time the FOREST AND STREAM comes home I look through it to see if there are any letters from sportsmen's wives.

My husband says, "Lil, there's another letter." I have said many times I would give in my experience, but I have not the heart to do it, for after all is said, mine is one of the best fellows that ever lived. But I can truly sympathize with those sisters whose husbands have brought home "a handsome pup." How many times have I begged and entreated not to have pups brought home. Many times have I been obliged to get up and coax, threaten, and scold, but the young cub would arouse the whole neighbourhood with his ki-hi-hi's, until, losing all patience, I would pick him up by the neck, intending to pitch him out of doors and finish him, but my heart failed me, I could not do it. So the pup lived to grow into a fine dog. Some people talk about the worry of children. I would sooner take the care of a half-dozen children than to have a pup brought into the house about every two years. They are a nuisance that women ought never to be pestered with.

But my husband does not keep a dog now, and, to my great satisfaction, goes fishing instead of hunting.

Here again I have teased him unmercifully, because he has never brought his trout home. He comes home telling us of the splendid fishing he has had, of the fine trout or bass taken at such a place, but we seldom see any of them, his excuse being, the distance is so great that the ice melts and the fish spoil before he can get them home.

Last summer I joined him on his fishing trip into Michigan. When he was putting on his fishing suit I teased all the time about the trout that stay in the brook, and "be sure you spit on your worms."

He came back in about two hours, gave me his creel to take out two or three fish, he said; but, as I opened it, I looked on one of the handsomest lot of fish I had ever seen, and counted out thirty trout. I have seen many fish before that came to the markets, but they were flat beside these fine fish, that only a short time before were struggling for life against a fisherman's skill.

To say I was proud of them is only the truth, and as each day passed, bringing about the same quantity to the table, I began to feel something of the same enthusiasm he so often manifests when going fishing. I have spent a portion of each summer in the country for years, but have never joined my husband in this way before. I expect to do so again next summer, and certainly feel inclined to do some fishing on "my own hook." I cannot understand the mysteries of my husband's fly book, or get the "hang" of casting with his light rod, but I am going to try it, even if I do get a ducking for my pains.

One thing I have stopped—"teasing about the fishes that never came home." The trip to me was the most enjoyable one in the sixteen years of our married life.

I can endure the idea of having tackle covering tables, chairs, and everything else around the house, and even help my husband when he is fixing up and repairing damages, because I hope to join him in the sport another summer, and if I cannot take trout on the fly, I am going to try black bass with minnows.

Heaven save me from the experience of raising another pup. LIL J.

MONKEYS ON A FROLIC.—"Al Fresco" sends us the following story from Jacksonville:—

At this season of the year Florida sports interest your readers. Thousands of Northern and Western tourists and sportsmen who have visited Jacksonville have been tempted to examine Greenleaf's Florida curiosities. Resolved upon furnishing additional attractions, he has invested in a brace of large monkeys. On Saturday last the lock of the monkey cage was broken, and a gentleman of the colored persuasion used a nail to fasten in the creatures. Mr. Greenleaf's watchmaker had numerous watches to repair, and worked until midnight. He carefully placed the works of a number of tickers in boxes, ready for Monday morning's operations. On Sunday morning the early visitors on Bay street were treated to an amusing performance. The farcical monkeys escaped from their cage and started on a "bender;" and words fail to portray what occurred. They acted upon the axiom that "liberty is sweet," and mischief inherent. The first point visited was the watchmaker's table, and the watch fixings were soon destroyed, widely distributed or rendered useless. The next object which attracted them was a student's lamp, and every portion was soon detached from its neighbor. One monkey discovered that the oil chamber was pregnant with amusement, and he used it *à la* pepper-box. No. 1 shook the reservoir at No. 2, and as a consequence distributed the oil over No. 1, curiosities, watches and other things too numerous to mention. In one of the windows were two jumping jacks—articulated representatives of monkeys supplied with dresses *à la* showman. Each monkey seized a jack and commenced pirouetting on the show cases, at the same time manipulating the articulated figures until disarticulation resulted. Finding that the figures ceased to respond to their muscular efforts, they used them as weapons to tickle each other's pate. The next field for their attentions were numerous boxes of polished sea beans, carved alligators' teeth, and other curiosities. With the most ludicrous grimaces and gestures they pelted each other with these valuables. Tired of this kind of sport, they made a vigorous onslaught on the stuffed birds; and when they had completed their investigations and operations, the birds resembled an object described by a Welsh sportsman:—

"Three jovial Welshmen, and jovial were they,
Went out hunting on St. David's Day;
They hunted and they hunted all around,
Until they found a frog in a well;
One said it was a frog,
And the other he said nay;
And the other swore it was
A canary bird with its feathers shot away."

Assuming a business and clerical role they visited the book-keeper's sanctum. Discovering that double entry was not a quadrumanic method of keeping books, they introduced a new method, and in a few moments bills, receipts, bills of lading and books were artistically treated and chaos was the result. At this stage of the performance the employers arrived, the monkeys were captured, and the evidences of disorder summed up by an interested but disgusted jury. The performance ended and the curtain dropped, but it will be some time before the owners of the tickers will regulate the movements of old Sol in his daily march, as New York will have to be appealed to to supply missing portions of watches.

Jacksonville, Fla., Dec. 15th. AL FRESCO.

THE "MAJOR SARASOTA" FUND.—*Jacksonville, Fla., Dec. 20th.*—Through your columns I wish to acknowledge the receipt of $5 from Henry F. Curby, of your city, for the relief of the widow and children of "Major Sarasota," Capt. Staples.

Our mutual friend, Doctor Furber, with two companions, will leave here on Tuesday for a sporting trip to Doctors Pass, south of Charlotte Harbor, and the Doctor will deliver the donation in person; and it affords me pleasure to state that the amount will be supplemented by the Doctor and his friends. Sincerely trusting that I shall have the pleasure of acknowledging the reception of many such letters, believe me to remain,

DR. A. C. KENWORTHY.

Answers to Correspondents.

No Notice Taken of Anonymous Communications.

☞ *We make no charge for answering inquiries in this column.*

R. S.—Such a book as you ask for is not published. The nearest to your wants is Kemp's "Yacht and Boat Sailing." Price $8.50.

SHARPIE.—See our advertisers; they are all men of repute. For sharpie, go to those who make a specialty of it.

M. B., New York.—We cannot send you a list of yacht and canoe clubs. It is not our business to do so.

M. St. L.—"Le Yacht" is an enterprising French contemporary of excellent management. Published weekly at 50 Rue St. Lazare. Subscribe through news dealer.

CLERMONT, Batavia, O.—1. B can put his two on the eight, and call it ten. 2. B cannot put the three on the seven-spot, and call it ten.

Y. R. A., New York.—The British Y. R. A. has issued a pamphlet containing their rules, to be had by addressing Harrison & Sons, St. Martin's Lane, London, W. C., England. Price, about 75 cents.

E. E. L., Philadelphia.—If you send full address will write you a letter. See late newspaper accounts of Edison's discovery. He relieves acute neuralgia and kindred troubles for the Menlo Park visitors.

BLUE WITH WHITE STAR, New York.—The best place for nautical ironmongery is Tiebout's, Pearl street, near Fulton. Charts from our advertisers. There is a yacht club at Norfolk, Va. A better port for all purposes could not be made to order.

SLOOP, Buffalo.—Dimensions of *Vixen* are as follows:—Length extreme, 51.13 feet; on water line, 44.85; beam extreme, 16.05; depth, 5.4, and measures 21 tons N. M., and 1818 cubic feet New York Yacht Club measurement.

C. H. Y., Hoosack Falls, N. Y.—You may send a description of your "Collect of Revenue" to Chas. L. Woodward, 78 Nassau street, New York, who deals in all sorts of rare books and pamphlets relating to America. The book you have is of not much value, we think, but if Mr. Woodward cannot tell you he will refer you to some one who can.

NOVICE, Portland, O.—A model is worth a good deal more than material and labor expended, because it is supposed to represent talent. You cannot buy an artist's picture for the worth of the canvas and paint, but must pay for his ability. Cheap models are generally not worth the having. Pay liberally and get what you want.

ENTHUSIAST, Bellefont.—You can build a canoe for $5. Of course, she will not be equal in qualities or finish to those made by Rushton or Roahr; but she will serve your purpose, if you can not afford to buy in the market. Will give directions for building soon. The Canoe Congress meets next August on the banks of Lake George. Send your address to N. H. Bishop, Lake George, N. Y.

—A rare opportunity is offered for the purchase of a fine bitch. See the advertisement of "Feather."

BETTER TIMES.—The business revival and new era of prosperity which has commenced are in keeping with the increased health and happiness all over the land resulting from the general introduction of Warner's Safe Kidney and Liver Cure. "The changes wrought by this remedy," says Rev. Dr. Harvey, "seem but little less than miraculous."—*Adv.*

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

FOREST AND STREAM PUBLISHING COMPANY.

—AT—

No. 111 FULTON STREET, NEW YORK.

[POST OFFICE BOX 2832.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Advertising Rates.

Inside pages, nonpariel type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial column, 50 cents per line—eight words to the line, and twelve lines to one inch.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

*** Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.*

NEW YORK, THURSDAY, JANUARY 1, 1880.

To Correspondents.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of mail service if money remitted to us is lost.

☞ Trade supplied by American News Company.

OUR NEW YEAR GREETING.

WITH the advent of the New Year it has been the custom of the FOREST AND STREAM, in times gone by, to pause with its readers for an expression of gratulation in review of the past and of good cheer for the future. To-day we thus extend the salutations of the season as, leaving the pleasant paths of the year which is gone, we cross over into the border land of that undiscovered country through whose fields and woodlands and beside whose streams lies our way in the months to come. And perhaps it is most fitting that for a brief moment we should lose our editorial identity to assume the more comprehensive personality of the whole great fraternity of sportsmen, that, speaking for them and with them, we may here pay a passing tribute to that graceful and facile pen and the ready sympathy with all that is best in sport, which together have made the FOREST AND STREAM to-day the approved representative of the devotees of manly sport and recreation in America. To conceive the plan of such a publication, and to mature the conception into its present goodly shape, is a notable achievement of journalistic success.

In succeeding to the management of the FOREST AND STREAM, we cannot refrain from expressing our appreciative recognition of the magnitude of the labor already performed in thus bringing the paper to its present standard, and of the consequently exacting demands of the task now devolving upon ourselves. The years already told have been uniformly years of most gratifying progress. To the satisfaction afforded by the contemplation of this success in the past is added the assurance of a like onward course, and a broadening of our field in the future.

The several departments of this paper are under the supervision of competent specialists, whose work will be marked by the same thoroughness and painstaking care which now make of these parts a perfect whole. With scores and scores of correspondents our relations have never been happier than they are at present; and in acknowledging the valuable services already rendered we may express the earnest trust that these favors may still be continued to the mutual satisfaction and benefit of all.

To each and every one, to correspondents and contributors, to regular subscribers and to chance readers, we wish a new year of pleasure in the FOREST AND STREAM, and this wish is seconded by the genuine ambition of our editorial corps that the rich promise contained in our past and present may be more than fulfilled in our future.

VALEDICTORY.

IT has transpired that new duties and responsibilities require the editor of FOREST AND STREAM to give place to other management. This step has not been taken without due consideration. From the outset I have contemplated the time when other interests might compelme to retire from active labor on the paper, though I confess I had hoped to remain nominally at the helm always. That time seems now to have arrived. Engagements of paramount importance call me elsewhere. Nevertheless, my heart and sympathy will remain with my pet project; and although it is fated that I must leave the beaten paths which my constant feet have so long trodden, I feel that there is a field of usefulness still open where the effort to please and instruct, so long ago begun, may be continued. To be more explicit, since some may require it: I am now engaged on a new book; besides, it is my purpose to devote some attention to my enterprise in Minnesota, where I have a county town which bears my name, and in the summer to visit the North Pacific and the intermediate country, taking a trip to Europe in the fall. All this, *Deo volante*. It is proper that I should undertake foreign travel before infirmities and gray hairs multiply, as my friends must admit. If they will but revert to my early announcement, they will also read what I then wrote, namely, that I undertook to establish a clean and wholesome sportsman's journal by the earnest solicitation of others, and not wholly of my own free will. To do so I abandoned a life of ease and semi-indolence, and the present successful results have been attained only by large pecuniary sacrifices. To the editor personally the paper has not been remunerative. That it is freighted with large promises of emolument to future proprietors is positive. If we are to believe our own convictions, and the assurances of friends, there can be no doubt that it is already a complete success, morally and financially. It has realized the aim of its proprietor, announced at the beginning, to inculcate in men and women a pure love for natural objects, and to stimulate a higher literature of manly sport.

I do not care to review my labors here, or to blazon my achievements before the world. The thirteen volumes with their precious contents, which now lie piled before me, are a sufficient testimony and a good enough monument. The advanced status of sports as they now exist in America and challenge the Old World, has been wholly attained since the inauguration of FOREST AND STREAM, and we believe has been largely promoted and determined by the efforts of this journal. Rifle Practice and Rifle Ranges, Bench Shows, Field Trials, Polo, Lacrosse, Archery, Ball-Trap Shooting, the installment of Bergh and the purity of the Turf, and above all the universal establishment of game clubs and systematic game protection, have all been instituted and made fixtures during the incumbency of the editor of this paper. For some of these he reasonably claims authorship and paternity. Above all, the name and dignity of the Sportsman has been elevated. He is now accorded a respectable and honorable place in the community, and his powers for usefulness and good are fully recognized.

It is superfluous, perhaps, to spend words in parting with a devoted and beloved constituency, who have done so much by their offerings and their contributions to make the paper what it is, and the value of whose substantial encouragement is gratefully acknowledged. To the officers of the army in particular, more than to any other class, is the editor directly obligated for notes and records of important discoveries in geography and natural history, which they have gathered in inaccessible places which even the persistent collector has not reached. There is scarcely a frontier post which has not its representative of FOREST AND STREAM. Professional writers, whose offerings are always in demand at highest prices, have constantly contributed their essays gratuitously and voluntarily. Government officers and foreign Ministers have snatched an hour from their manifold duties to drop us a line or a sketch. Rough backwoodsmen have conquered their modesty and sent us, in homely phrases, but kindly spirit, valuable notes which have fallen within the scope of their observation. And so, uniting all the desultory parts, we have created a consummate homogeneous whole, which is the pride of the editor and of all his co-workers. Furthermore, I should fail of my bounden duty did I neglect to acknowledge the very valuable editorial assistance rendered in the earlier life of the paper by Mr. Barnet Phillips, whose unceasing and honest efforts contributed in a very great degree to its success, and who did more than any other man to stimulate rifle practice in America when it was in its infancy; also to Wm. M. Tileston in the middle years, and latterly to Chas. B. Reynolds, who still remains.

There is at least one occasion in every man's life when it becomes most painful to say "adieu," and that occasion may not happen at the end. The editor has grown up so intimately with his friends during the past six years and a half, and has been in such constant communication with so many of them, that it seems like sundering family ties to close the door behind him. With many he has enjoyed pleasant passages by field and stream, and there are others whose still unaccepted invitations are likely now never to be filled. On his files are hundreds of personal letters, valued heretofore as friendly tokens, but now to be carefully cherished as precious links in the chain of old memories. Possibly they may serve to bind some lasting friendship. Comforting also is the consciousness that no serious enmities have been incurred, despite the trying character of the ordeal. Certain it is that it is not in the nature of sportsmen to quarrel. Gunners seldom do—anglers never! Anglers are not wranglers. I have always found the middle path of comfort and success to lie in a disposition and earnest purpose to deal justly with all, and give partisanship no handicap.

And now, after a long and laborious trick at the helm, with the good ship piloted safely beyond dangers into the clear open sea, with favoring breezes and courses laid true, I transfer my trust to my successors with the best grace possible, and wish them "good speed." FOREST AND STREAM has been my especial charge for nearly seven years, and knowing from a long editorial experience, which dates back to the year 1852, what obstacles and mischances beset the voyager, I feel a natural solicitude for its future welfare. I trust, however, that it will attain, under its new management, a more enviable position and a more enlarged sphere of honor and usefulness than ever before.

Boys, good bye!

Fraternally yours,

CHARLES HALLOCK.

☞ Hereafter the business address of Mr. Charles Hallock will be at 61, Broadway, Room 23; Post-office box 3,156.

SUCCESS IN JOURNALISM.

THE life of any newspaper or periodical is a precarious one at the best. Statistics show that but one of every fifty publications started becomes permanently established. Either they are not needed, or they do not meet the requirements; and if there should be a demand and place for a special publication, it can even then secure success only by a great outlay of labor and capital, and a persistent struggle with rivals and opponents.

A journal may be said to be permanently established when its income exceeds its expenses, and when its hold upon the public is so strong that it need not feel apprehensive of new competitors. From the very beginning it has to be carefully nurtured, directed, and guarded, as much from incapacity and dissension within, as from enemies and assailants without. Probably more ventures are wrecked by the first cause than by the latter. To secure success, a journal must press itself into notice by the moral force of its own merits, ingratiate itself into favor and be able to hold the interest and esteem of its patrons. At all times during its puberty it is liable to the mischances and diseases of adolescence, and even when grown to sturdy maturity, some false step or injudicious measure of policy or economy may suddenly check its growth or give it a blow from which it will not recover. Patrons are capricious. Like a school of fish feeding, some unseen movement may frighten them, and they disappear altogether.

It has been the good fortune of the FOREST AND STREAM to attain what may be considered perfect success. It has a constituency of its own which cannot be alienated except by some rash action, or error of management. Many of its patrons have been with it from the beginning, and lent it constant encouragement and aid. Rarely, if ever, has a journal been blessed with so devoted a following. It only remains now for it to hold its vantage ground and signal success will continue to follow it.

THE SWEET SINGERS OF THE COAL MINES.—It is one of the blessed qualities of music that it may dwell in the heart of the humblest—not the artificial music of the schools always, but the music of nature. None are so lowly that they may not have it in their souls. Some of the nations of the earth who toil the hardest and the longest sing and dance the most, too. In all this broad country of ours there is no class whose toil is more severe than the workers in the coal mines. Thousands of these people are Welshmen. The Welsh love of music is proverbial. They carry the old home songs around the world with them. In every Welshman's heart is a responsive chord which answers to their notes. Not long ago there was a story in the papers of a Welshman, a miner, who had committed murder in Wales, and had fled to this country. A shrewd detective of Scotland Yard bought him a bag-pipe, and strolled through the coal regions of Canada and the Northwest, playing his tunes and keenly noting his hearers. He knew the man's love for music, and that, though a murderer, he had not stifled this part of his nature. Finally the detective with his tunes found his way into Pennsylvania, and there, one day, in the crowd of listeners, he found his man. We never doubted this story; for if one had invented the tale, he might just as easily have made the *denoument* a happy one.

...lish Musical Festival recently held at Phila... was, in many respects, a remarkable gathering; ...e for its rare musical excellence than for the char... of the participants. "The bone and sinew of the as...liage were the coal-region miners and workmen." ...n with their city compatriots, have preserved to ... children, and for their children's children, the language of their native land, and have cultivated not only a love for music, but the science of it, to a degree that enables them to present grand choruses with wonderful precision and effect. The language that looks so hard to American eyes in print, when wedded to the Welsh national airs, produces fine musical effects, marked, however, more by force than liquid sweetness. The singers themselves were nearly all miners, or members of miners' families, though there were choirs from the larger cities of the anthracite region, which combined the hardest underground toilers with men and women who have had better opportunities for musical culture. The feature that marked all the singing, even of the combined choirs, where 1,200 singers joined in the national airs of Wales and America, was that there were no laggard voices taking their cue from other singers. From the youngest to the oldest—and there was probably a range of fifty years of difference in the ages of the singers—each understood his or her part, and sang it with a will, guided by the baton of the director, to whom all paid strict attention. Such results could not be reached if the Welshmen of Pennsylvania had not well maintained the national love of music as something more than a sentiment. That they have done so was shown by the presence in the choirs of whole families of miners—the husband and wife, with the children, the mother attending, in some cases, with a child in her arms. The large county choirs that competed for some of the prizes have had few opportunities for rehearsal. They are made up of a large number of the smaller choirs and glee clubs organized in the mining towns; but music is so thoroughly studied by all the singers that they can unite together without rehearsal, and sing with even better effect than many well-drilled choruses composed of less skilled vocalists. If any part of what has been said by philosophers of the refining influence of music is true, these cultivated Welshmen should serve as leaven for the whole anthracite region. It certainly is true that these lovers of music are the reverse of the rough characters who have heretofore been accepted as typical miners. A more orderly, good-natured, happy-looking set of singers is seldom seen at any public gathering." And yet, by one of the strange incongruities of human nature, these very philosophers who reason about the refining influences of music are all at fault. The musician who entrances an audience, and sends a thrill through the vast multitude, repairs, after that audience has dispersed, to the nearest lager beer saloon, and there, with huge schooners of this gross drink, and amid the heavy fumes of cigar and cigarette, relapses from the artist into the coarse boor. Music may have etherial and refining influences, but many of the world's most famous musicians have been the reverse of gentlemen.

DEATH OF JOHN HARGREAVE.—It is with feelings of sorrow that we have to announce the death of John Hargreave, the well-known Philadelphia cricketer. This melancholy event, caused by typhoid fever, took place at his late residence in Wister street, Germantown, on Saturday morning last, at 5 o'clock. The deceased was a weaver by trade, and was only sick about one week. At the time of his death he was only 29 years of age; a fine athlete, wirey and supple, he was all that could be desired in a representative of the "manly game." The family name of Hargreave is but a synonym of good English cricketers, there being in all six brothers, who all have reputations as good players. John Hargreave was the acknowledged leader of his brothers in this respect. He was among the first in the eleven of the Germantown Cricket Club, and as a safe batsman and brilliant field was unsurpassed. Of late years he has always been selected to play on the All-Philadelphia eleven, and on every occasion he fully sustained the high opinion formed of him. The principal matches in which he took part were, against Grace's team in 1872, when he secured the second highest score; Canada, and the British officers, in 1875; the Australian team of 1878, and against the Irish and English elevens of last season. In 1877 he stood head of the list in the batting averages of his club, with 34·27 obtained in 13 innings, his century of 104 being of this year. For 1878 he was fourth, with 15·5, the result of 10 innings, and last season he retained the same position, with 15·3 for 8 innings. Although several of his brothers have reputations as bowlers, we do not remember ever seeing Hargreave handle the ball. With the death of this fine young fellow Philadelphia loses one of her first cricketers, and the Germantown, one of its best players. His death will be mourned by many. The funeral took place on Tuesday, and the body was interred in Ivy Hill Cemetery.

—W. D. Chapman & Son's fishing tackle factory, at Theresa, N. Y., was burned Friday night. Loss $10,000.

GAME PROTECTION.

MIGRATORY QUAIL.—We make the following extract from a private letter, written from Mount Air, Fairfax County, Va., dated December 16th, and referring to the introduction of the migratory quail into that county:—

I take great pleasure in congratulating you, and the other gentlemen interested in the enterprise, upon the fair degree of success which has attended it.

The birds, twenty-five in number, when liberated, were evidently in remarkable health and vigor, and, with the exception of two of the cocks, took wing immediately, making a flight of about one-fourth of a mile, and spreading themselves widely over an excellent cover. In order to secure for them the utmost protection, as well as to keep myself informed of the localities they might select, I took every occasion to give publicity to the fact of their introduction, and also a description of their peculiarities of form, plumage, and habit. I am gratified in saying, that, so far, I have heard of only one of them having been shot, and that case I am sure was purely accidental. At this time I can speak confidently of the existence of five coveys of sixteen to twenty each, all within a radius of about a mile of the spot where the birds were turned out; and as some of the birds have been frequently seen at other and more distant places, I am led to think there may be many more than those already mentioned. Our winters here are usually so short and mild, I think it likely many of them will remain; but, in any event, the present success fully justifies the belief that our covers will soon be amply stocked with them.

HOUNDING VS. STILL-HUNTING.—*Burlington, Vt., Dec. 15th.—Editor Forest and Stream:*—I read with pleasure an article in your valuable paper of Dec 11th, headed as above. I think our Maine friend hits the nail on the head and drives it home when he uses the term, selfish still-hunter, for some of them are not only selfish but brutal. Myself and party have had twenty-seven hounds killed by still-hunters in the Adirondacks the past twelve years; some of them brutally killed. It is a cowardly, mean act, for a man to revenge himself upon a poor innocent hound, doing his duty and master's bidding, by shooting him, and, as is sometimes the case, wounding and leaving him to suffer and die. I have hunted in the Adirondacks for the past fifteen years nearly every fall, and have not violated the law except in one particular; one June, while fishing, I killed a deer for eating. I believe in making a law for the whole, not for any particular class of men, and then enforcing it. My experience in hounding deer is in perfect accord with that of the gentleman in Maine—that if no other kind of hunting was done deer would increase. If a party of six or eight men kill a deer each day, hounding, they are doing well, while the average is far below this. The same number of men still-hunting will kill five times the number. I have still-hunted some; but for genuine sport, give me a good party and good hounds, and others may still-hunt that wish to; but let the dogs alone. Give us a law for all; a stringent law that will protect the noble deer against the infernal slaughtering in summer by torch, and crusting in February and March. The law as now on the statute books of New York is good enough if enforced, with one exception. I think the time for killing deer should not begin until September 1st or 15th, and should close December 15th. The mode of enforcing the law is wrong. Instead of appointing local game constables, and offering a part of the fine money to the informant, an appropriation should be made by the State, or a fund raised by sportsmen, for the purpose of employing good men to see that the law is enforced—men who would not ask nor give favors. They should be paid a good salary, that they could and would give their time to the cause. They should not be appointed from nor near the places they are to guard if they are expected to enforce the law. Night hunting in June, July and August by torchlight is increasing at a fearful rate, and at the present rate of slaughtering this poor, innocent creature, five years will use them completely up. In my judgment four deer out of five are killed in the summer months or deep snows, when it is against the law.

A. B. WITHERELL.

§ THE WEST JERSEY GAME PROTECTIVE SOCIETY—*Camden, N. J., Dec., 1879.—Editor Forest and Stream.*—I notice in your last week's issue, a Philadelphia dissertation upon game laws, etc., quoting extensively from the Act creating the above-named society. As many criticisms have from time to time appeared in several newspapers, notably in your journal (as a special authority on such matters), as well as numerous New Jersey papers, and more Philadelphia and other papers in Eastern Pennsylvania, I think it proper to say something of the status of the society. The Philadelphia papers and those below, notably at Chester, have occasionally expressed themselves in bitter terms concerning this society and its charter. Now it ought to be known that this society is purely a Philadelphia institution. It is true, two New Jersey sportsmen (brothers-in-law), one residing in Atlantic County and the other in Gloucester County, were the ostensible movers and authors in getting the charters and organizing the society, but in reality the "power behind the throne" was and is within a Philadelphia sporting association. Originally there were several New Jersey members, but before the first gunning season, the Philadelphia members outnumbered them ten, if not twenty, to one. In a year or two nearly every Jersey member dropped out, and it is reported that for two or three years past there has not been a single New Jersey member except the officers of the society. At all events, I was thus informed by a Philadelphia member who ought to know. Had the Pennsylvania papers known these facts, perhaps they would have had less to say about the "selfish Jerseymen."

A word about their charter. Although I have read law somewhat I make no pretensions to being a lawyer. I have, however, heard some of our best lawyers express their opinions concerning this remarkable charter, and all to the effect that the Act was clearly unconstitutional, and really one of the most absurd Acts passed for many years. It is well known also, that the provisions of the charter have been repeatedly violated by the society or its managers, and it is a wonder that any person pays them for the privilege of gunning in New Jersey, for (it is said by our lawyers) the society would not have any show in a Court of Chancery.

What have they done? Our gunners say "Nothing of account." They have introduced a few small lots of birds, and distributed them among the personal friends of the managers in isolated, out-of-the-way places, known to the certain few, and where they were wont to repair on their Jersey hunting excursions. Our gunners say that the regular game laws of the State have never been more wantonly violated than at the present time. A genuine South Jersey society is wanted. The W. J. G. P. Society is a New Jersey society only in name.

FEEPUR.

The West Jersey Association have at least shown a commendable activity in carrying out the law, whether it was constitutional or not. As there are doubtless two sides to this question, we shall be pleased to give all a hearing.

PRIZES FOR NEW SUBSCRIBERS.—We invite special attention to our commissions for new subscribers, a complete list of which is published elsewhere. There is always a satisfaction in performing a worthy work, and when such a labor is attended with a pecuniary reward the satisfaction is doubled. Those of our readers who may care to act as agents in extending the subscription list of the FOREST AND STREAM may thereby win both self-complacency and a substantial return as well. Our prize list is a liberal one, and we shall look for liberal returns from it.

—We have published a handsome and highly ornamental colored FOREST AND STREAM poster, which we will send to such of our friends as will put it up in a conspicuous place, where it may be seen and read by all men.

—The *Florida New Yorker*, now published monthly, devotes much attention to the various Southern resorts, considering especially their climate as adapted to the cure of pulmonary diseases.

NATURAL SCIENCE AT THE CAPITOL.

The following appeared in the "Kansas City Review of Science and Industry" for December, 1879.

Hyperia in the Nectocalyx of Abyla Pentagona.—Editor Review.—Will you put this little bit of information in your next number?

The life of Hyperia and its brood in the barrel-shaped body of a dead Doliolum is well known. Such Doliola, with crustacea within, are often taken in pelagic fishing. The larger Nectocalyx of a Siphonophore Abyla Pentagona may replace the Doliolum. I have frequently captured, in my fishing on the Piedmontese coast, in South France, specimens of such Abylæ with Hyperia and brood within. The upper and smaller Nectocalyx of the Abyla was always detached. This Nectocalyx, of course, never reached the dimensions of a large Doliolum, but it forms a perfect little house for the crustacean and its young. Only one end of this Abyla house of Hyperia has an opening, which is the natural entrance into the bell cavity.

J. WALTER FEWKES.

Cambridge, Mass., Nov. 12th.

The astounding statements contained in the foregoing article have attracted the attention of our law-makers in Washington, and for that reason, no doubt, the three weeks of the second session of the Forty-sixth Congress just ended, have not been marked by any of the exciting debates which many expected. No political question, at least none yet presented, can compare in importance with "Hyperia in the Nectocalyx of Abyla Pentagona."

The following letters to Professor Fewkes, from some of the most erudite and learned members of the House of Representatives, will show the interest aroused by the article above quoted in the minds of those best qualified to grapple with the problem presented. Kentucky and Tennessee appear to have been first awakened to the necessity of prompt action. But our genial and accomplished townsman and representative, as was to be expected, puts in an early appearance and shows himself qualified to take a prominent part in the coming struggle. And we learn that Maryland and North Carolina are becoming deeply interested, as we may show in some future number of our paper, if our readers evince that interest in the subject that its importance justifies.

WASHINGTON, *Dec. 15th*, 1879.

My dear Sir:—For many years I have devoted most of my leisure to pelagic fishing, invariably using the Hyperia and brood as bait, and have rarely failed to take a fine string of Dohola, with an occasional specimen of the larger Nectocalyx, of the Siphonophore Abyla Pentagona; but when I have related my experience in this branch of piscatorial amusement to my brethren of the rod, my statements as to the avidity with which a Doliolum will rise to a Hyperia have been received with evident incredulity.

I am, therefore, delighted to learn that you have actually found the Hyperia and brood in the barrel-shaped body of a dead Doliolum; and would be greatly obliged to you if you would send me an affidavit embodying your statements as published in the December number of the Kansas City "Review of Science."

I do not wish to flatter you, my dear sir. Indeed, I would not "flatter Neptune for his trident, nor Jove for his power to thunder," for I do not wish to thunder, and have no earthly use for his trident. But you will permit me to say that your researches in crustacean architecture have brought the human family under obligations to your enlightened zeal which worlds could never repay. The philanthropist can now sleep in peace, soothed by

the consciousness that the unfortunate but respectable family of Hyperia, doubtless one of the links in the grand chain which connects the original monad with the perfect man, are furnished with comfortable residences, although their houses have only an opening at one end. I would suggest, however, that in your next you should state distinctly in which end the opening is situated, and also how well off the Hyperia are for out-buildings.

J. PROCTOR KNOTT.

J. WALTER FEWKES, ESQ., Cambridge, Mass.

WASHINGTON, D. C., *Dec.* 15, 1879.

J. WALTER FEWKES, Esq., Cambridge, Mass.

My Dear Sir.—I have read your article in the *Kansas City Review of Science and Industry* for December, 1879, on "Hyperia in the Nectocalyx, of Abyla Pentagona," with feelings of mingled pain and pleasure. While I agree with you that the "Nectocalyx never reaches the dimensions of a large Doliolum," I would suffer myself to be burned at the stake before I would assent to the proposition that "the larger Nectocalyx of a Siphonophore Abyla Pentagona may replace the Doliolum." I stand on the Doliolum, and am utterly unwilling to see it replaced by a Siphonophore Abyla Pentagona.

Now, it is quite clear to me, as it must be to every reflecting man, that you are correct when you say that "the upper and smaller Nectocalyx of the Abyla is always detached." Still I cannot permit myself to believe that "only one end of this Abyla house of Hyperia has an opening."

Yourstatement that "Doliola with crustacea within are often taken in pelagic fishing," must not be permitted to pass unchallenged. You will pardon me for saying that I have always adhered to the belief that Doliola were cynocephalous fasciolaria, which communicate a distinct anthrodinia to the epithalium of the echinoderm, and as a necessary consequence must be taken in archaic rather than pelagic fishing.

Please furnish me fuller information on this whole subject, as I am literally consumed with anxiety.

Yours, &c.,
J. A. MCKENZIE.

WASHINGTON D. C., *Dec.* 15, 1879.

Dear Sir.—Although a stranger to you, I cannot refrain from expressing the deep interest and enthusiasm with which I read your article of Nov. 12, 1879, published in the December, 1879, number of the *Kansas City Review of Science and Industry*. In that article you say that "the larger Nectocalyx of a Siphonophore Abyla Pentagona may replace the Doliolum."

I have given to this subject much study and research, and am inclined to doubt the conclusion to which you have come. If not asking too much, I will be obliged to you to give at length the data on which your opinion is based.

Very respectfully,
JOHN F. HOUSE.

J. WALTER FEWKES, Esq., Cambridge, Mass.

WASHINGTON D. C., *Dec.* 16, 1879.

My Dear Mr. Fewkes.—Life is at best a protoplasm, and the plasm is as innocent as the Abylæ which you have honored with your attention. When, therefore, you give to the life of the Hyperia, as well as its brood, a barrel-shaped body, I naturally insert my spigot in the orifice, so as to extract the vital essence of your paper in the *Kansas City Review*.

You say that "it is well known that this barrel-shaped body is not unlike a dead Doliolum." Now, sir, I have often fished in a pelagic way, but never had the pleasure of catching a dead Doliolum. I have raised a few of them in the neighborhood of the flounder fishing on the banks of Madagascar, but they were always alive; so that I cannot verify your statement that the Hyperia is like the dead Doliolum. In fact, I am inclined to deny that assertion. Once or twice I had some scores of bites of the lesser Nectocalyx. In fact, I brought to the surface a fine specimen of the Siphonophore Abyla Pentagona. But as I did not land it, owing to special ukase of the Queen of Madagascar, I cannot, as I would wish, replace with it the Doliolum.

I thought that Abylæ were never taken with Hyperia, and my impression remains that the brood was not between the upper and smaller Nectocalyx. You intimate that the latter is always detached from the former. Will you please review your experience on this head. I have frequently taken the Doliolum alive, but it was firmly attached to the house of the Hyperia at an opening, but not the one you describe.

Now, Mr. Fewkes, I pray you to try to find a natural entrance at both ends of the Abyla, not alone in the interest of science, but for the sake of quieting the tumult of opposition your article has raised in the minds of Hon. Mr. Knott, of Kentucky, his colleague, Hon. Mr. McKenzie and Hon. Mr. House, of Tennessee. They assert fearlessly that they have frequently taken in the waters of the Great Cave of Kentucky the Siphonophore, but it had always an Abyla and a Pentagona attached, and at only one opening. Two openings, sir, would refute many of the theories of those empirics, who deny that the life of Hyperia and its brood can ever be found in the crustacea within the pelagic waters of the Great Cave. But if it be found that there are two openings, will it not induce the belief, as an analogy of nature, that the Great Cave itself has two openings? If it be found that is more than one opening to the Great Cave, as well as to the Abyla Hyperia, will it not follow that the native distillation of Kentucky may be encrusted by the upper aud lower Nectocalyx, and will the Doliolum then be replaced by the Siphonophore Pentagona?

These questions, my dear Mr. Fewkes, are answerless, yet incessant.

Yours, etc.,
S. S. COX.

THE PAST YACHTING SEASON.—With the fourth paper by "Rouge-Croix," which appears in this issue, is brought to a close a most interesting, able and valuable communication anent the recent racing season. The experiences of the writer in all matters connected with this sport entitle his opinions, so happily recorded, to the careful attention of all devoted to this fascinating and really scientific pastime. In the stereotyped phrase, "we point with pardonable pride" to the review by "Rouge-Croix" as another evidence of the enviable list of unequalled contributions to be found in our columns.

The Rifle.

GLASS-BALL CHAMPIONSHIP WITH RIFLE.—The championship of America for glass-ball shooting with rifle was decided on Friday last at the shooting school of Captain Bogardus, No. 20 Eighth street, in this city. The match had been generally advertised, and the fact that only two candidates appeared showed the general appreciation of the difficulty of this style of marksmanship. There was no throwing of the balls up from an assistant trained to put them to a regular point in the air, as was done in the Carver shoot against time at Deerfoot Park. Up to this time glass-ball shooting with the rifle had been only a sort of shooting trick used in exhibitions and shows, but not recognized by any rules. Captain Bogardus was the first to fix a definite code for the guidance of all shooting in this style—gaining thereby a uniformity of practice, and making it possible to carry on matches. The present match was brought about by the offer of a fine gold badge by the Winchester Repeating Arms Co. For the first contest the entrance fee was fixed at $10, and Eugene Bogardus, the son of the champion wing-shot, with Dr. Bower Talbot, were the only ones to face the trap. The shooting was at 100 balls each, sprung from a Bogardus trap, at five yards rise.

Young Gene has shown himself to be a wonderful shot, and with his .32-calibre Scott rifle is able to average over ninety in the hundred. The high sights of the repeating rifle used bothered him somewhat, as these were set for one hundred yards, and the Winchester with flat sights ordered by him had not yet come. The shooting editor of the FOREST AND STREAM acted as referee, and the lad having won the toss, went to the score first, firing at ten balls, and then giving way to his opponent to fire at a like number, and so on to the finish. The Doctor was entirely outshot, and seemed utterly unable to find the balls in the air—sometimes shooting over and again under, with bewildering irregularity. The boy hit the ball either rising, still or falling, as he happened to catch the sight, but in each case got a positive sight before he pulled off. The score, by tens, stood:—

The winner says that he will adhere strictly by the rules of the badge, and any one wishing it must put up $100 fee and win it.

WONDERFUL PISTOL SHOOTING.—Mr. Frank H. Lord has again performed a feat of marksmanship worthy of notice. On the evening of the 18th inst. at Conlin's shooting gallery, while favoring a number of his friends with an exhibition of his skill in quick shooting with pistol at a moving object, he hit, in twelve shots, six swinging three-quarter-inch bullets, at the word of command, distance twelve paces. This style of shooting is a new venture with him, which fact makes his brilliant score all the more remarkable. Unexcelled as Mr. Lord's previous records in pistol shooting have been, his skill continues to approach nearer and nearer to absolute perfection.

[J. S. C.

MASSACHUSSETS—*Fitchburg, Dec. 24th.*—A squad from the Washington Guards took a sleigh ride to Pound Hill Rifle Range this afternoon, and did some shooting, although none made the required score entitling them to be reported in the Adjutant-General's report for 1879, which is 17 out of a possible 25. The distance was 200 yards, off-hand:—

M. Larkin	2 2 0 0 0	4	D. Marcy 3 2 2 2 0
J. Keefe	3 3 0 0 0	6	Lt. Concannon 4 4 3 2 2
J. McCarty	4 3 3 2 0	12	Lt. Shea 4 4 3 3 2
E. Sweeney	5 4 4 2 0	15	Capt. Bride 5 3 2 2 0
J. O'Hern	4 4 3 3 2	16	Capt. Kirby 4 4 4 2 2

D. Marcy	3 2 2 2 0	9	
Lt. Concannon	4 4 3 2 2	15	
Lt. Shea	4 4 3 3 2	16	
Capt. Bride	5 3 2 2 0	10	
Capt. Kirby	4 4 4 2 2	16	

Gardner, Dec. 25th.—There was some good shooting at Hackmatack Range to-day by members of the Rifle Club, several prizes having been offered, the winners taking their choice according to their record. Following is the score:—

C. O. Bent	153	G. R. Pratt	177
L. S. Walker	143	G. F. Ellsworth	223
S. Hildreth	194	F. E. Nichols	181
H. C. Knowlton	231	Chester Hinds	186

The club will meet on Saturday of each week for practice, when the weather is favorable.

WASHINGTON, D. C.—*Columbia Rifle Association.*—Notwithstanding the forbidding weather quite a number of riflemen went out to Benning's Saturday afternoon, the 20th inst. The first call was the long-range match, when P. J. Lauritzen, Colonel Burnside and Dr. S. I. Scott entered and began firing, but very soon Dr. Scott's rifle "leaded" so badly it threw the bullet very wildly, giving him a great number of misses, and he withdrew.

Following is the score of the other gentlemen:—

P. J. LAURITZEN.

800 yards	4	5	5	4	4	5	5	5	4	5	5	5	5	5	5	5—71
900 yards	5	5	5	4	5	5	5	4	4	4	5	5	5	5	5	4—68
1,000 yards	4	5	5	5	5	5	5	5	5	5	5	5	5	5	5	5—74
Total																213

COLONEL BURNSIDE.

800 yards	5	5	4	5	5	5	5	5	5	5	5	5	5	5	5	5—74
900 yards	5	4	5	5	5	3	4	5	5	5	5	5	5	5	5	5—71
1,000 yards	5	5	3	3	3	4	4	5	4	5	5	5	5	5	5	4—65
Total																210

The shooting of Mr. Lauritzen at 1,000 yards was exceptionally good, starting off with a "flamings" and ishing with fourteen bull's-eyes in succession. Soon the start at the last distance Colonel Burnside fell difficulty in the manipulation of his sights during shower that occurred then, and he did not recover fr it in time to round up with his usual shooting at this treme distance.

At the short-range match, which was shot at the same time with the long-range, the scores were as follows:—

C. H. LAIRD.

200 yards	4	4	4	4	5	4	4	4	4	4	4—41					
300 yards	5	4	4	3	4	4	5	5	4	4	4—43					
Total																83

A. A. ADEE.

200 yards	4	4	4	4	4	4	5	4	4	4	4—41					
300 yards	3	4	4	4	3	2	2	4	4	3	3—33					
											74					
Points allowed to military rifle											3					
Total																77

MR. JOHNSTONE.

300 yards	5	5	4	4	4	4	5	4	5	3	3—43					
200 yards	4	2	3	2	4	4	2	4	4	4	3—33					
Total																76

Game Bag and Gun.

GAME IN SEASON FOR DECEMBER.

Moose, *Alce Americana.*
Caribou, *Rangifer caribou.*
Elk or wapiti, *Cervus canadensis.*
Red or Va. deer, *C. virginianus.*
Squirrels, red, black and gray.
Hares, brown and gray.
Wild turkey, *Meleagris gallopavo.*
Pinnated grouse or prairie chickens, *Cupidonia cupido.*
Ruffed grouse or pheasant, *Bonasa umbellus.*
Quail or partridge, *Ortyx virginianus.*
Woodcock, *Philohela minor.*

Swans, Brant, Wild Ducks, Geese, &c.

☞ This table does not apply to all the States. It is meant to represent the game which is generally in season at this time. State regulations may prohibit the killing of some species of game here mentioned.

LOADING CHOKE-BORES.—In last week's number I gave my method of loading choke-bores with buckshot. I used No. 8 buckshot, and the result was one seven-year and one five-year buck. The large buck was coming right towards me, when I fired the first barrel, at five rods. I put seven buckshot clean through his neck, and one or two struck the breast bone and flattened. This did not stop him the least; but, as he went by at four rods, the other barrel killed him. The other buck was a cross-shot at fourteen rods. The first barrel put one buckshot in the ham, and one in fore-shoulder. The second barrel, at sixteen rods, put only one buckshot into him, but it went clean through his vitals, near the heart, and lodged in the skin on the other side. This is strong shooting; but this size buckshot is too small. They never bleed a deer outwardly, and it is hard to track him. A rifle is the thing for such game; but, if you must use buckshot, I say, from practical experience, to use the largest of which the gun will easily chamber three; twelve for a 10-bore, and nine for 12-bore. As an improvement in the manner of loading stated in last number, I recommend to cut the paper shell, to go into the brass shell, long enough to easily chamber twelve buckshot by threes, when closed.

This method is much the safest, and then the charge will not stick at the muzzle. I presume fine shot would shoot closer and deeper by my method. Understand, you must not chamber your buckshot by the muzzle of the gun, but by the part of paper shell used to slip into the brass shell when that paper shell is closed. Be sure to cut it so that, when closed, it slips readily into the muzzle of the gun. Any one who will try this manner of shooting buckshot for breech-loaders, if they carefully follow directions here and in the last number, cannot fail to kill the deer at ten rods at least, if they aim true, and the gun is a good one.

R. W. H.

RAPID SHELL LOADER.—*Editor Forest and Stream:*—As any means of loading shells by a quantity at a time is a great improvement on the old method of one at a time, and hence an advantage to the sportsman, I wish to testify to the advantages of the Slocum Loader, one of which I have had during the past season. It is very simple, and loads the shells evenly and uniformly, and when fifty shells can be filled by one movement, it is saying enough as to saving of time. Many loading machines have been brought out, but this is the best I have seen, and I can recommend it fully. William Read & Sons sell it.

A. H. BOGARDUS.

TREAT'S ISLAND CAMP.—*Bethel, Me., Dec. 17th.—Editor Forest and Stream:*—Reading Mr. Rollins' very interesting paper on his August trip to Parmachene Lake and beyond, reminds me that my friend John S. Danforth is building this winter on Treat's Island, a four story camp; so in future his visitors will have elevated views from their sleeping rooms, of Parmachene and all the surrounding country, but not a house or opening in the dense forest will be seen for thirty miles in any direction; and looking east one hundred miles to Moosehead Lake without a break. In summer Mr. Danforth has a regular mail line once or twice a week, by the way of associated camps at Indian Rock, supported by himself. This fall Mr. Danforth has killed two caribou which he has stuffed and fitted to his island camps for ornaments. Luman Sargent and Alvah Cooledge, of Upton, have trapped forty-six mink this fall; also two otter, and considerable other game about the Umbagog and Molly-chunkemunk Lakes.

J. G. RICH.

CONNECTICUT—*New Haven Dec. 19th.*—Coots have left this section of the Sound, and the old squams have not been so plenty for years. Of late they have been feeding about the cove.

GOLD BAND.

NEW YORK—*New Hamburg, Dec. 3d.*—I received an invoice of the far-famed European carp from Blackford, which I will put in Wappinger's and Fishkill creeks for the benefit of the citizens of Dutchess County. Fishing at this point is about over for the season, except for pot-

whi
o'cl
in- unters for catfish. They use set lines with 400 to 600 hooks, bait with salt mackerel, and hoist these lines every slack tide. Thirty to fifty pounds is good fare for one line per day. Some of these lines are over one and a half miles in length. Some of these fish weigh up to five pounds. VAN W.

NEW YORK—*New Hamburg, Dec. 16th.*—W. S. Johnson, of Poughkeepsie, recently killed, back of Ellenville, 19 woodcock and 8 partridges. VAN W.

NEW JERSEY—*Ocean County, Dec. 22d.*—No ice as yet. Shooting for ducks during the past week in the stormy weather was the best of the season, and some good bags were made, one stand killing eighteen redheads and broadbills in one morning. Moor hens (*poule d'eau*) are here in millions; as soon as ice comes great fun can be had with them in air-holes. Quail out quite plenty since the rain. S. K., Jr.

TENNESEE—*Nashville, Dec. 22d.*—A sportsman walking through our market house yesterday, would have doubtless come to the conclusion that this was the country for him. Deer, wild turkeys, ducks, quail, squirrels, rabbits, and opossums, in profusion while at the lower end of the building were quantities of black bass, striped bass, perch, jack fish, buffalo, drum, and channel cat. To give an idea of the supply, quail were selling at $1 a dozen, and wild turkeys and venison about ten cents a pound; fish proportionately cheap. J. D. H.

FLORIDA—*Titusville, Brevard Co., Dec. 13th.*—Just returned from a trip to Banana River, near Cape Canaveral. Deer, bear and ducks very numerous. Killed three deer in the De Soto orange grove one night, fire-hunting; also one very large black bear in the Hall hammock. The bears are very fat now, in fact, like hogs, this one having three inches of fat on the rump. They feed now on the cabbage palm berries and on the horseshoe crabs. They come out on the river shore at night to capture the crabs, and are shot from a skiff, with a strong reflecting head-light. I surveyed over a township (six miles square), and passed hundreds of thousands of cabbage palms, and did not find a single one that was not marked by the claws of the bears, made in ascending the tall, straight trunks to feed on the numerous sweet berries which are now ripe. These berries are about the size of a large currant, black, with a very large stone, and tasting something like dried dates. They are very fattening to the bears and also to swine, and are much liked by children.

The narrow strip of land between the ocean and Banana River has fully twenty times more bears and deer to the acre than any other part of the State I have seen, and I have travelled the eastern part pretty well over in the practice of my profession. The marshes of Banana River are now teeming with ducks, and will remain so until May. I noticed the black duck, sprig-tail, bald-pate, shoveller, blue and green-winged teal, shelldrake, little blue-bill, ring-neck, grey duck and dippers. The Florida Gallinules and "coots," as here called (*Futisa Americana*), are in every bay in countless millions. They are fat and tender, living on turtle grass, and cannot be told from a rabbit, if skinned and properly cooked. Quail and rabbits are numerous also on shore. Pelicans—the brown ones (*Pelicanus furcus*)—breed over there. The river is alive with mullet and bass. Thirteen mullet jumped into our boat, attracted by the bright light. The deer tracks in the cane fields are too thick to be counted. AL. I. GATOR.

INDIAN TERRITORY—*Fort Sill, Dec. 16th.*—The past season was so dry in this section that game is very scarce. Chickens hard to find during the season; quail are not abundant, and widely scattered, and we have had no ducks worth speaking of. Turkeys, of course, can be had by the cart-load, by going after them moolight nights, or they can be bought for fifty cents, occasionally less. Plover were very abundant last summer and fall, and stayed with us a month later than ever before known. Hundreds, perhaps thousands, were killed. Buffalo have almost disappeared from the Territory, and for that reason the deer will diminish, in numbers, as the Indians will kill more than formerly. G. W. S.

SHOOTING MATCHES.

KNICKERBOCKER YACHT CLUB.—*Port Morris, N. Y., Dec. 20th.*—The first handicap match at glass balls, was shot off during the rain storm in the morning, fifteen balls each :—

D. F. Caughlin	25 yards—1 0 1 1 1 1 0 1 1 0 0 0 1 0 0—8	
W. Potter, Jr.	25 yards—0 0 1 0 0 1 0 0 1 1 1 0 0 1 0—6	
T. N. Jacques	25 yards—0 1 1 0 1 1 0 1 0 1 1 0 1 0 0—8	
A. A. French	25 yards—1 0 0 0 1 0 1 0 1 1 0 1 1 1 1—9	
F. B. Chedsey	25 yards—0 0 1 1 0 1 0 0 1 1 1 1 0 1 0—8	
S. C. France	18 yards—1 1 0 0 0 0 1 1 1 1 1 1 1 1 0—10	
A. Steinke	18 yards—0 1 1 0 1 0 1 0 1 1 1 1 1 1 0—10	
T. T. Nixon	18 yards—1 0 1 1 0 1 1 0 0 1 0 0 0 0 0—6	
W. Fulton, Jr.	18 yards—1 1 0 1 1 0 0 1 1 1 1 0 0 1 1—10	

Shooting off the ties :—

France	1 1 1 1 0—4
Steinke	0 1 0 1 0—2
Fulton	0 1 1 0 0—2

In the afternoon the weather was more favorable for shooting, and the pigeon match proved a very interesting contest. Sweepstakes; 10 birds; 21 yards rise; 80 yards boundary :—

S. C. France	1 1 1 0 0 1 0 1 1 1—7
W. Fulton, Jr.	0 1 1 1 1 1 0 0 1—7
T. N. Jacques	1 1 1 0 1 1 1 1 1—9
A. Steinke	1 1 1 1 0 0 1 1 1 0—7
F. B. Chedsey	0 1 1 1 1 1 1 1 1—9
A. A. French	1 1 1 1 1 0 1 1 1—9
J. R. Cole	1 1 1 1 1 1 1 1 1—10
T. T. Nixon	1 1 1 1 1 0 1 1 1—9
D. F. Caughlin	1 1 1 1 1 0 1 1 0—8
C. Baker	1 1 1 1 1 0 1 0 1—8

J. R. Cole won first money, second being divided between Messrs. Jacques, Chedsey, French, and Nixon. All hands have improved greatly in pigeon shooting since the Thanksgiving match.

Tom's River, Dec. 18th.—A shooting-match took place here to-day, including many of the best shots in town. (Weather quite cold, with light wind). Conditions: 7 birds each; 5 traps; distance 25 yards; both barrels allowed; no restrictions on powder; 1¼ ounce shot; those wishing to shoot 1¼ ounce to fall back to 27 yards; sweepstakes :

G. Low	0 1 1 1 1 1 1—6	E. Naylor	0 1 1 1 1 1 1—6
C. Applegate	1 0 1 1 1 1 0—5	J. Applegate	1 0 0 1 0 0 0—2
J. Wainwright	0 1 1 0 1 0 0—3	H. C. Glover	1 1 1 1 1 0 1—6
E. Potter	1 1 1 1 0 1 0—5	C. B. Lewis	1 0 0 1 1 0 1—4
P. Potter	0 0 1 1 1 1 0—4	W. James	0 1 1 0 1 1 0—4
E. Rockwell	0 0 0 0 with'w	J. Cluto	1 1 1 1 1 1 1—7

G. Low, E. Potter, E. Naylor and H. C. Glover divided.

Second sweepstakes; 3 birds; same conditions; winner taking all the money :—

E. Naylor	1 1 1—3	Chas. Miller	0 1 1—2
H. C. Glover	1 0 1—2	C. B. Lewis	1 1 1—3
J. Cluto	1 1 1—3	A. Bailey	0 0 1—1
G. Low	1 1 0—2	R. Worth	0 0 —0

J. Cluto won ties, having killed 15 out of 16 birds.

S. K., Jr.

NEW JERSEY GUN CLUB—*West Side Park, Dec. 16th.*—Regular monthly shoot at pigeons for champion badges, handicapped rises; club rules; H. and T. ground traps. A lot of very fast birds :—

	Yards.							
R. Warne	22	1	1	1	0	1	1	1—6
C. Sedor	22	1	0	1	1	1	1	1—6
W. Hughes	22	*	1	1	1	1	1	1—6

B. Dusenberry	21	1	1	1	0	0	1	1—5
H. Geiger	22	0	0	1	1	0	1	1—4
T. Hughes	21	1	0	0	1	0	1	1—4
J. Cable	21	0	1	0	0	0	1	1—3
W. Steers	21	1	0	0	*	0	0	0—1

Ties on 6; 25 yards :—

Warne	1	1	1	0	1	1	1	1—8
Sedor	1	1	1	1	0	1	0	—6

Hughes and Wilms withdrew.

Sweepstakes; 21 yards rise; classified :—

Sedor	1	1	1—3	Sanders	0	0	1—1
Geiger	1	1	1—3	Steers	0	0	0—0
Wilms	1	0	1—2	Cable	0	0	0—0
Barclay	1	0	1—2	Ely	0	0	0—0
Pearson	*	0	1—1				

Ties divided.

Second sweepstakes; same conditions :—

C. Warne	1	1	1—3	Sedor	1	1	0—1
R. Warne	0	1	1—2	Sanders	1	1	0—2
Wilms	1	*	1—2	Barclay	1	0	0—1
Pearson	1	1	0—2	Smith	1	0	0—1
Geiger	0	1	1—2	Steers	0	0	1—1
Cable	1	1	0—2	T. Hughes	0	0	0—0

Ties on 2; 25 yards :—

R. Warne	1	1—2	Geiger 1 0—1
Wilms	1	1—2	

The rest missed their first.

G. L. W., Secretary.

Yachting and Boating.

THE YACHT RACING ASSOCIATION.

During our absence the movement to form a National Yacht Racing Association, as first mooted and advocated in these columns, has taken actual root in the appointment of a committee to further consider the subject in January. Concerning the movement much has yet to be said, but for the present we must content ourselves with a few words of advice which, we are certain, will not be amiss in view of the important bearing the proposed yacht racing association will have upon the racing prospects in America.

It will be manifest to those having the success of the Yacht Racing Association at heart, that the executive element of such an association must be composed of gentlemen of repute. The presence of any person or influence of questionable character or tainted reputation in business circles will, as we are advised, be considered sufficient by the leading clubs to ignore the whole matter. The active co-operation of the New York Yacht Club, Seawanhaka Yacht Club, Atlantic Yacht Club, Eastern and Boston Yacht Club, and other prominent organizations, is absolutely necessary, unless the enterprise is to drop to something of second rank and of only local influence. Those most directly interested in the furtherance of the scheme cannot, therefore, be too careful in the selection of the individual members who are to handle the helm and steer the ship through the mazes of technical problems, which will have to be solved upon a rational basis in order that their deliberations may be acceptable to the fraternity at large. We appeal to the committee not to allow themselves to be "captured" in whole or in part by any person or persons who have an axe to grind of their own, and whose connection with the movement is certain to bring it into bad odor among the more influential clubs of the country. Unless the direction of the affairs of the Yacht Racing Association is confided to the care of persons whose character will bear the closest scrutiny, and unless the steps taken are such as to make the Yacht Racing Association a thoroughly national combination, it will be useless to expect further support or sympathy at our hands. There is yet time to enforce such measures as will lead to success, and with an earnest desire to promote the best interests of all, we hope these words of caution will not fall upon those who "having ears to hear, they hear not."

The committee, as at present constituted, is more or less self-appointed. It remains to be seen whether the outcome of the next step to be accomplished at the January meeting will be such as to receive the willing co-operation of all clubs. No characterless person must be permitted to fasten upon the movement, nor should the promoters allow the wool to be pulled over their eyes and lend themselves to an advertising dodge of a precarious business venture. The line between the disreputable and respectable elements of society must be drawn somewhere. The mere fact of a person's being outside the walls of a jail should not be considered sufficient evidence of the propriety of his presence and association with others engaged in an undertaking for which popular favor is sought.

We await further results before entering into questions of detail.

THE QUESTION OF TYPE.—The diversity of model, represented by cutter and sloop, has now been so freely discussed throughout the land, that the proper time seems to have come to close a discussion, a further continuance of which would fail to be of benefit to the public. This, of course, only so far as we are concerned editorially, for to correspondents full liberty is accorded to bring to notice any facts they may observe in relation to the performances of model.

Never before was the important question of type so fully set before the public in all its bearings as through these columns, and we have the satisfaction of knowing that the differences between, and peculiarities of the two grand divisions are now better understood than a year or two ago. This was the main object we had in view in starting the topic. As a number of cutters have already been built, with a couple more in frame and numerous others in prospect, should the commercial "boom" continue, a class of cutters seems now to have been fairly established in American waters, and we leave it to the future to show whether or not such vessels are destined to form a permanent fraction of the nation's yachting marine. With the batch of letters published last week, selected from a dozen or more, we close what has been an effort on our part, brought to a more successful issue than had been looked for at the outset.

A CANOE CONGRESS.

IT gives us pleasure to state that the efforts which have been underway for some time past to form a National Canoe Club are about to bear fruit in a general movement of the canoeing world throughout the continent. That something ought to be done to set this sport on a sound basis and give it that impetus which only combined action can produce, has been evident for several years. The time is ripe and the opportunity is now offered. Hitherto canoeing has languished in America, not from lack of enterprise of individual owners, but rather from want of harmony and that fellow feeling begotten only of thorough organization and a community of interests. The constantly augmenting body of canoeists throughout this broad land, blessed with incomparable waterways, bays and bayous for the prosecution of their health-giving and charmingly romantic sport, may congratulate themselves upon having in their ranks some leading spirits who are certain to bring to a successful issue anything they undertake. These gentlemen, all of them worthy of support and confidence, have banded themselves together for the energetic furtherance of the canoeing interests in America. It is proposed to call a general convention of all concerned at a convenient point in the middle of next summer and to establish what must become a recognized authority of strong influence in furthering the best ends of canoeists in the United States and New Dominion. Anything which promises to promote the welfare of the gentlemen sportsman and to place the manly pastimes on a sound, liberal and enduring basis in America, meets with the heartiest indorsement, and has the fullest support of this journal.

As the call for the formation of an association of yachtmen was first made in these columns—a call which has since borne fruit—we give space with pleasure to a similar undertaking on the part of a class which is gathering strength so rapidly that it bids fair soon to rank with the knights of the paddle on the other side of the Atlantic. The following is the call as issued :—

A general convention of canoeists will be held at Caldwell, Warren County, N. Y.—head of Lake George—August 3d, 4th, 5th and 6th, at which it is proposed to perfect the organization of a National Canoe Club, of which local clubs now existing will be branches, and to take such further action in the interests of the pastime as may be deemed expedient. Sailing and paddling races will be arranged for each day, the conditions of which will be duly announced. All canoeists are invited to attend, and as a preliminary measure are requested—whether owning canoes or not—to send their names to N. H. Bishop, Esq., Lake George, Warren County, N. Y., indicating their willingness to join the National Club; annual dues to be nominal. Membership will carry with it the right to fly the National Club signals; will secure the temporary use of boat-houses belonging to enrolled clubs, and will entitle the member to one copy of the club publications. There are several excellent hotels at Caldwell, and camping places will be secured for all who desire them. Invitations will be extended to English and Canadian canoeists to attend—with their canoes—as guests, and assurances have been received that they will be well represented. Your active coöperation is earnestly desired. You are particularly requested to send the address of all canoeists in your vicinity to Mr. Bishop, and to invite their coöperation. Your suggestions as to the course to be pursued will be of service.

C. L. NORTON, 849 Broadway, New York,
Com. New York Canoe Club,
CHAS. E. CHASE, 287 Broadway, New York,
Com. Jersey City Canoe Club.
ROBT. D. WYNKOOP, Jersey City, N. J.
REV. CHAS. A. CREESY, Landaff, N. H.
E. A. RANSOM, Jersey City, N. J., and others.

The names appended are those of well known canoeists,

and all stand high in community. The call is, of course, only in the nature of a preliminary step, and we learn that suggestions made by any one present at the proposed meeting will be given full consideration in such a way that the new organization will become truly "national" in every sense. The individuality of clubs will not be interfered with in the least, as it is intended that the business of the National Club shall be carried out on the basis of a vote to each member. The arrangement of all details of the constitution and by-laws will be in the hands of the congress itself, and the whole movement is instituted not by or for the furtherance of any club or influence in particular, but with the sole view of putting canoeing on a sound foundation, spreading the popular taste for the sport, and for the general advantage of all who may join.

We trust that so favorable an opportunity as now offered will not be allowed to fail through lethargy, but bespeak an active participation in the congress on the part of each and every canoeist in America. If not able to attend in person, arrangements should be made for representation by proxy. We may add that it will afford us pleasure to assist through these columns in any manner that may be deemed advisable. In the meantime we urge all to comply with the request made, and send their addresses to N. A. Bishop, Esq., in order that the work in hand may be advanced and facilitated as much as possible.

ANOTHER BIG SHARPIE.—The schooner sharpie, building by Mr. Clapham at his yard in Roslyn, L. I., for New York parties is approaching completion. She is 52 feet long, 16 feet beam, and 4½ feet deep, with over six feet in cabin. Being intended for duck shooting on the Chesapeake, she has been given more beam and is to receive a lighter rig than if speed had been kept in view. Concerning the material and workmanship in this craft too much praise cannot be bestowed upon the builder. For thoroughness in detail, ample scantling, best material, and fastening, the sharpie will not only compare favorably with any yacht work, but is in many respects superior to the general run of craft launched. After the publication of our annual list of races and winners we hope to give detailed information and plans which will be of interest to all sportsmen.

ORION'S RECORD.—*Editor Forest and Stream* :—In last week's FOREST AND STREAM, "Martin Gale" speaks of the performance of a keel boat against a centre-board, and refers to the race between the *Enterprise*, *Regina*, and *Winsome*, from New London to Greenport last summer. But did you notice the performance of the *Orion*, Vice-Com. Cooper, centre-board, which started twenty-five minutes after the *Enterprise*, and got in twenty-six minutes before her? W. B. H.

New York, Dec. 26th.

☞ *The time for electing officers for the ensuing year being now at hand, we request secretaries of yacht clubs to forward the new lists as soon as convenient. Copies of club books will also aid us much in tracing yachts, and will be received with thanks.*

THE PAST YACHTING SEASON.

FOURTH PAPER.

[SPECIALLY COMPILED FOR FOREST AND STREAM.]

SEPTEMBER breezes. How often these are looked forward to by yachtsmen who have suffered from the doldrums during the three previous months, and who believe that the month which brings back the oyster is sure to bring back likewise strong winds and grand sailing weather, with no fear of drifts to spoil races. Alas! this year September was not true to its character, and did inflict some horrible calms which came in most inopportunely. The month opened with uneventful racing by the yachts of the Salem Yacht Club, keel *Dolphin* beating the first-class centre-boards she was opposed to, although at one time both *Leona* and *Mignon* were ahead of her; *Coquette* led the second class lot, and in the third, *Tulip* had a sail over.

A threatening drift on the 6th happily gave place to a good breeze for the Boston Yacht Club regatta, and *Viking*, which has performed wonderfully well during the season, scored another brilliant victory after a grand race with *Lillie*. Among the second-class schooners *Loiterer* showed to advantage, and made up for previous defeats by gamely landing first prize. *Rebie*, *Edith*, and *Sunbeam* had a regular mittening among themselves for the third class sloops prize; *Rebie* leading off, being passed by *Sunbeam*, and finally going to the front again and winning.

The Royal Canadian Yacht Club, once the crack club on the Lakes, but now content with occupying a second place and retrograding to the use of shifting ballast in some of its races, had a regatta the same day, which regatta, owing to a buoy not having been properly moored, ended in a *fiasco* for the first class, in which were some new and also some ancient specimens of naval architecture. *Madcap*, a vessel of which I know nothing save that she was built by Cuthbert, and that she belongs to Mr. Boswell, Commodore of the Royal Canadian Yacht Club, led from start to what became the finish, but the disappearance of the buoy caused the race to be declared null and void. Her rivals were *Brunette*, a 24-ton sloop, built three years ago; *Rivet*, a very ancient 17-ton iron cutter, built on the Clyde nearly forty years since, and once a great prize winner at Royal Canadian Yacht Club races; *Oriole*, Mr. Campbell's beautiful 95-ton schooner, built in 1871 by Shickluna, at St. Catherine's; the 38-ton yawl *Alarm*, better as a cruiser than as a racer, and *Coral*, a 16-ton sloop. In the second class the honours all went to Bay of Quinte Y. C. yachts, *Katie Gray* carrying away Commodore Boswell's cup and the $100, *Emma* the second prize of $60, and *Gracie* the third of $40. *Imogene*, a 6-ton yawl, formerly owned by that accomplished yachtsman, Lord Dufferin, also started, with five others, but was out of the hunt. The third class prizes secured thirteen competitors, the dollars going to *Fiona*, *Nellie* and *Wanderer*, in the order named.

The Eastern Yacht Club, whose handicap regatta had failed through lack of wind, determined to sail it off at the same time as their fall regatta, and double prizes lent additional interest to what was counted on as a good contest. But the most sporting of clubs cannot command the winds, and though there was plenty of breeze at the start, it suddenly failed at about noon, and the races in the first class were declared off. There was a fine entry, too, *Intrepid*, *Phantom*, *Halcyon*, and *Foam* in the first class for schooners, and *Fearless* and *Latona* in the second, while *Addie V.* and *Madcap*, first class sloops, made a match of it. Just before the wind dropped there came a parting rally, which carried away the jibbooms of *Phantom* and *Foam*, and split *Halcyon's* staysail, after which only the gentlest of airs sighed over the water. Northwesterly winds have a trick of doing this, and I never recollect without a smile being caught in a 30-ton sloop in a howling squall from that quarter, while beating to windward. There were three of us, all Corinthians, and we put her before it, boom buckling and rising up in the air till we got peak lowered and mainsail and jib close-reefed, when we hauled our wind for another stretch. Breeze took off, out came all reefs; lightening still, up went gaff-topsail, and absolutely within twenty minutes of having her snugged down for what promised to be a hard blow, we were flat becalmed with everything set. To return to our Orientals—the second class sloops and the third class schooners had a good race, the only mishap being the loss of *Anna's* topmast, carried away while setting her "spar-breaker;" and schooner *Sylph* landed both the allowance and the handicap prizes; *Dream* securing the second handicap, and sloop *Shadow* walking off with the allowance prize for her class. The club's ill-luck attended it to the end, for twice subsequently, on the 15th, and 16th, were the combined races started again. On the first day *Halcyon* leading, reached the finish 22 min. after the time was up, and the next, which promised better, as it was blowing hard from southeast at the start, the wind played its old trick, died out, came light out of northeast, and the race could not be finished in time. This was a very great pity, as besides leaving the destination of the prizes unsettled, three or four useless attempts to sail a race through are enough to discourage the most enthusiastic, who are apt to grumble, and not without reason, at the limitation of time rule. No doubt there are good reasons for decreeing that a race must be finished in so many hours, and if we could always be certain that the elements would conform, and the wind blow steadily enough to allow the yachts to perform their task, no objection could be taken to it. As it is, races are often shorn of their interest, both for spectators and contestants, by the fact that it is hopeless to expect them to be finished in time, and the owners have all their trouble and expense for nothing. Personally, I believe it is best to have no limit, even though some inconvenience is thus entailed on the committee in charge, and the race finished perhaps at night.

The 9th September was a gala day for the Frisco yachtsmen, who, not satisfied with their breezes and seas, went in for an ocean race, in which the new *Annheuser* again beat *Consuelo* in a reefing breeze, pretty effectually settling the question of superiority in favor of Mr. Gutté's craft. The sight of the day, however, was, by all accounts, the performance of *Clara* in the second class, this yacht being driven by her new owner, a Scotch yachtsman used to "west coast weather," in a fashion that somewhat scared the onlookers, and enabled her to give *Frolic* an unmistakable beating in the ramping wind and sea.

The autumn regatta for the Southern Yacht Club Challenge Cup, saw that valued prize won by a new boat, *Cydnus*, which led from start to finish, *Albertina*, that had won it in spring, being so horrified at the speed her rival displayed, that she incontinently turned bottom up, and *Limnas*, the third contestant, filling with water, had to be anchored to give her crew a fair chance of bailing her out.

Æolus distributes his favors very unequally, and gives clubs with yachts that dare not face a blow, a regular scudding breeze, and palms off on hard weather clubs miserable airs. This was the case on the 13th, when a stiff off-shore west-southwest wind induced the vessels of the Chicago Yacht Club to decline racing, while the Royal Nova Scotians dolefully contemplated an almost flat calm. Matters improved, however, and a humming breeze from southwest blew the colors out and filled the sails of the fleet. In the first-class *Petrel* and *Seafoam* met, but in the long turn to windward the sloop proved altogether too good for the schooner, and she walked away with a long lead, eventually securing the prize very easily. In the second class *Psyche* did one of those bits of sailing that are sometimes heard of but seldom seen. Flat becalmed a long way astern when the gun fired, and last to get the breeze, she crossed the line 8m. 30s. after *Petrel* in the first-class, yet in a dead turn to windward of four miles, not only caught up the yachts in her own class, but took the mark from the big sloop, that only managed to leave her when sheets were checked and their loftier canvas told. Of course *Psyche* won as she pleased, and right well has she shown what Corinthians can do in handling a yacht skilfully, for I am informed her owner always sails her himself with no professionals on board. In the five ton class Mr. West's new *Ina* gave the hitherto invincible *Muta* an exemplary beating.

When one mentions the annual Pennant Regatta of the Atlantic Yacht Club, visions at once arise of rude Boreas laying yachts in to the rail and stripping them of their muslin in less than no time. It is singular that nearly every year the Atlantics are so particularly lucky in having roaring breezes and half gales of wind for their closing festival. Who does not remember the end of the race in 1877, when *Wanderer* and *Rambler* sped across the finishing line with everything flying? Or that of last year, when *Peerless* stripped to the sudden blast, and *Winsome*, with her huge club-topsail where it ought not to have been just then, caught it most severely, heeling over till all who saw her made sure she was gone, and her crew had a time of excitement which, as Gilbert says, they are likely to

> * * * "carry to the Catacombs of Age,
> Photographically fined
> On the tablet of their mind,
> When a yesterday has faded from its page."

Of the contestants that day *Peerless* and *Agnes* turned up this year, with *Dolphin*, *Genia* and *Lizzie L*, as representatives of the sloop class. A small fleet, undoubtedly, and a striking commentary on the seagoing (?) qualities of the majority of American yachts, the strong northwest wind frightening other competitors. It is strange that after all that has been written and said about the superiority of our models over the English, especially in a heavy wind and sea, American yachts should decline racing in weather which is sport to Britishers. Not that they are to be blamed, being unfit to contend with anything more serious than a good summer breeze, but the bragging some of us indulge in looks very small when it ends in a back down. What has made me a believer in the deep, powerful style of craft, is that excellent teacher experience, and it has also, I am glad to say, converted some friends of mine from the shallow and beamy theory. I am willing to grant that in ordinary summer weather the shallow yacht, carrying a great crowd of sail, shows great speed and often beats the deeper craft, but come a breeze and, presto! things are changed. I have sailed a ten-ton craft under whole lower sail in a breeze that laid her in two planks under, when a shallow model—mine being deep—could not look at it under close reef, but in light breezes she walked round me, and I did not mind, for I knew my craft could stand a blow and she could not. But let me work back. *Peerless* and *Agnes*, both with reefed mainsails, and the latter with double reefs in foresail and jib as well, to counterbalance her rival's housed topmasts, went off at score, *Agnes*, holder of the pennant from last year, leading. She was overhauled by the swift *Peerless*, reduced top hamper telling its tale in the seaway, and below the hospital ship had to up-helm for home, her foremast having been sprung, whereupon *Peerless* kept the pot boiling for her own benefit, and sent the pennant to join her other prizes of the season. *Dolphin* was the only first-class sloop out, and, of course under reefs, sailed round the course, getting a very bad knock-down in the style of *Winsome* last year. In the second class sloops *Genia* gave up and *Lizzie L*, like the other two winners, sailed over. A catboat, the *Wind*, made a start—whole sail on, trusting to sandbags—but over she went, crew in the water, shifting ballast in its place at the bottom of the sea, and the prize decidedly *in nubibus*.

The race was quickly sailed, *Peerless*, with single reefed mainsail, completing the course of forty miles in exactly five hours, or at the rate of eight miles an hour. This was with a reaching wind—the best for a schooner—and only a very short bit of turning to windward near the Romer. Now, this reminds me of a race sailed in "auld Scotland," at Largo, at the Royal Northern regatta, in July five years ago—strong wind and lots of sea; and in view of the prevailing belief that British cutters cannot sail by the side of American sloops and schooners, I am tempted to make a little comparison. *Peerless* is sixty-seven feet on the water line, rather over than under. The racers in the R. N. Y. C. forty-ton race were *Britannia*, cutter, fifty-nine feet on water line; *Myosotis*, cutter, same length; *Bloodhound*, cutter, fifty-nine feet four inches; and *Glance*, cutter, about fifty-five feet. The wind was strong from southwest, the yachts single reefed, third jibs, reefed bowsprits, the course over rather over forty miles. The start was made at 11.38 A. M.; *Bloodhound* won at 3.34.10 P. M., *Glance* (last boat) finishing at 3.50.24. *Bloodhound*, therefore, sailed the course in 3h. 56m. 10s., and *Glance* in 4h. 12m. 24s., comparing favorably, "not to put too fine a point upon it," with the larger vessel's five hours for forty miles.

There was enough wind from south-southwest on the following day to cause a casualty in each of the three races of the South Boston Yacht Club, the worst being the capsizing of *Unique*, whose skipper was nearly drowned. *Lilly* managed to secure the first class centre-board prize, and *Banneret* in second class keels was hailed victor, while *Peri*, centre-board, scored in third; prizes for first class keels and second class centre-boards went to *Annie* and *Allie* respectively. The catboat championship in Boston waters was decided on the 19th. *Fancy*, Mr. P. Grant, was first home, with *Herald*, Mr. W. B. Smith, second; but the third boat, *Rocket*, which had been the last to start, won the $35 and the championship by time allowance. At the regatta of the Dorchester Yacht Club, on the following day, sloops triumphed over cutters, *Enterprise* and *Saxon* bringing up the rear in the light wind, and the smart *Viking* leading the fleet home. The *Sea Rover*, however, had started after the expiration of the five minutes delay allowed, and this being brought to the notice of the judges, she was properly disqualified.

The right way to start yachts is the way adopted by the Royal Nova Scotia Yacht Squadron in their handicap race on the 20th. No time was allowed at the start, and good seamanship came into play, three of the leading yachts crossing the line exactly at the same time, and the rest hot foot after them. *Hebe*, the crack Nova Scotian sloop, had things all her own way. She was lucky in getting what breeze was going, and holding on to it till she completed the course, winning first prize, *Ina*, a three-tonner, hanging on through drift and calm till it was pitch dark, and she and *Isabel* managed to get an air that took them past the line.

The Bay of Quinte Yacht Club autumn regatta was a spirited affair, the club giving good prizes for ten and five tonners, and some good sailing being the result. A new yacht, *Judge Jellett*, appeared among the tens, but did not do much by the side of *Katie Gray*, *Kathleen*, *Emma*, *Surprise* and other well-known lake racers. *Katie Gray* led at the start, but *Kathleen* eventually got into first place and won. The five-ton race resolved itself practically into a match between *Mystery* and *Wide Awake*, resulting in favor of the former.

A large entry and a nice breeze made the East Boston Y. C. open regatta, on the 26th, a pleasant occasion, and *Viking* scored again, carrying off the keel sloop's prize, that for centre-boards going to *Siren*, and the winners in the other classes being respectively *Veronica*, *Eva*, *Nonpareil* and *Waterwitch*. *Anonyma* was the first schooner

which, but lost the prize to *O K*, on a protest for foul start. o'cl
The last event of importance was the "ocean race" for the Centre Cup, by four yachts of the Seawanhaka Yacht Club: *Mischief*, *Regina*, *Wave* and *Blanche*. It is very much to be regretted that no full account of the race has been published, as, being sailed in open water, and during a part of the time, at least, in a good wind and sea, details of the behavior of the yachts would have been highly valuable at a time like this, when the question of sea-going yachts is being thoroughly discussed. As far as I have been able to learn, the sloop-rig did not show to great advantage in the southeast blow which caught the racers, and that the anti-cutter type, as illustrated by *Blanche*, failed in that crucial test of a model—turning to windward in a sea. *Mischief* had things her own way all through; led from start to finish, and won as she pleased—managing, as did both *Regina* and *Wave*, to get round Cape May lightship before it piped up from southeast, thus making a fair wind of that same breeze which played old boots with *Blanche*; that unfortunate craft, after carrying away the jaws of her gaff, parting her weather rigging, springing her bowsprit and spanking the seas in good fashion, with her decks washed fore and aft, had to upheln and run for it—none too soon, either, by all accounts. *Regina* made good weather of it under double-head rig and with reduced mast and boom, but she had the wind behind her, like *Mischief* and *Wave*, the latter sailed by Greenwood of *Sappho* fame. The former was very uneasy as she ran off the wind for home, her huge spars being by no means so much admired by her crew, as at every roll she slapped her boom under water, and threatened to play unpleasant pranks. She is of the deep displacement kind, and with her thirty tons lead ballast, would, no doubt, prove a splendid sea boat if her rig were modified. I believe see has as much rigging and as many blocks about her as a cutter of her own size, all costing as much in preliminary outlay and rather more in running expenses. Changing her rig to cutter would assuredly improve her; and as for *Blanche*, she is an example of the unhandiness of the sloop rig, as her top hamper pinned her down, and even reefing failed to relieve her. The moral of this race, as of the *Vision–Gracie* one last year, is that our heavily-sparred, beamy sloops are not the craft for anything more than summer breezes and rippling seas. They cannot stand a blow that an Englishman will revel in, and shove a fifteen tonner through in safety.

A goodly number of private matches were sailed during the course of the season, some of which I may note. There was one in July between *Albertine* and *Lady Emma*, for the neat sum of $3,000, won by *Lady Emma*. On the 14th of the same month, *Charles Cohill* and *Josie Norcross*, of Cooper's Point, Y. C., sailed a match for $25, which ended in a dead heat, and *Waterwitch* defeated *Fancy* in a $100 match the same day. Sloops *Ella*, of Oswego, and *Katie Gray*, B. Q. Y. C., met at Kingstown on the 15th, the stakes, $250, going to the Belleville yacht. An exciting match for a $1,000 prize was sailed at San Francisco on the 19th, between the crack *Consuelo* and *Cornelius O'Connor*, a new yacht built by Farnham & White expressly to beat *Consuelo*; just as *Annheuser* was immediately afterwards. In a good breeze the new craft won as she pleased. White Bear Lake, Minn., was the scene of a yacht duel on the 20th, *Juniata* and *Nellie Ilsley* sailing against each other for $100 stakes, that went to the former. The 23d saw a sweepstakes race for $100, between schooner *Seafoam*, sloops *Petrel* and *Hebe*, R. N. S. Y. S., and sloop *Secret*, won by *Hebe* in a nice breeze. There was some heart-burning caused by this affair, and with some reason. The race was fixed for the 22nd, "play or pay." The sloops did not like the looks of the weather, and cared not to go out to sea; in fact, their pilots funked it. The schooner was ready to start, but the referee allowed himself to be swayed by the opinions of the timid pilots, and put off the race. Of course he had the right to do so, but clearly he should have sent the yachts off, as the match was "play or pay," and one, at least, of the contestants was ready, and quite capable of sailing five times the length of the course in very much worse weather. On the 28th *Mitchell* and *Ledyard* sailed a match over the Chester course on the Delaware, the former capsizing. *Ledyard*, a few days before, in a match for $100 between five yachts of the Southwark and five of the Philadelphia yacht clubs had carried off the money and the honors for the Southwarks. On the 5th October catboats *Hasse* and *Pauline* met on the Delaware; stakes $100 a-side, won by *Hasse*.

I have now reviewed the principal doings of our yacht fleet during the past season, not as well or as fully as I could have wished, but as there must be a limit to all things, I have had to pass over the doings of many a club, not that they were unworthy of notice, but simply that, had I systematically set to work to say something of each race sailed, I should have wearied my readers, if I have not done so already, and overtaxed the patience of FOREST AND STREAM. I may later on, if these notes find favor in the eyes of yachtsmen, and the editor can spare me space, establish a comparison between the performances of some of our best known schooners and sloops. Meantime, in closing this rambling yarn, I will take occasion to address a few words to my fellow-writers, who keep us all posted in the doings of the various clubs. To give full value to an account of a yacht race, intended to be a permanent record in the yachtsman's organ, the following points should be carefully attended to:—

1. Locality of race. 2. Description and length—actual, not estimated—of course should be given. 3. Names of starting yachts, with tonnage or water-line length, rig, and names of owners and builders should be carefully inserted. 4. Amount and nature of prizes should be stated. 5. Weather and direction and force of wind. Times of start and finish are generally given very fully.

At present, as I have already had occasion to remark in penning these notes, it is exceedingly difficult to trace the records of yachts, owing to the general absence of owners' and builders' names, of lengths, and the awful confusion and multiplicity of classes. This militates strongly against a really useful comparison of performances being made, and consequently against improvement. It would greatly facilitate matters if we had an "American Yacht List" published annually, containing full particulars concerning each yacht, such as name, name of owner, club belonging to, rig, tonnage, length on water line, beam, name of builder. The names of yachts to be arranged alphabetically, and a number placed opposite each, by which reference could be made to it. With such a list in existence, properly compiled from authentic information supplied by owners and by secretaries of clubs, much labor would be saved in making out accounts of races, as all that would be needed would be to mark the list number opposite the name of each yacht, and any one curious about name of builder and dimensions of vessels could find them by looking up the list.

I am well aware that attempts have been made "to supply this long-felt want," and I have "The Commodore's Signal Book and *Vade Mecum*," of 1874, the "Yachting Annual," of 1875, both published by Thomas Manning, and the issues for 1874 and 1875 of Niels Olsen's "American Yacht List" before me as I write; and I am also well aware that neither of these publications lived, chiefly, I believe, through want of support. Manning's "Yachting Annual" was a very handsome book, but failed in some essentials, while overburdened in needless details. For instance, the numerous colored plates of private signals could have been dispensed with, and a different arrangement adopted for the body of the work. In fact, the whole book was got up too much as an *édition de luxe*. Olsen's book was better in many respects, and was arranged in the best possible way, the names of yachts being given alphabetically and numbered consecutively. Barring the printing of club signals, which was horrible, the 1875 list left little to be desired, and I, for one, very much regret that Mr. Olsen's venture was not continued. I believe that *one* such publication would pay; *two* could not, and two are not wanted. I am afraid Mr. Manning got sick of his enterprise, else I should like to see him start an "American Yacht List" again, adopting Olsen's as a model instead of his own "Annual." If the proposed Yacht Racing Association succeed, the List might be issued under its authority, and official approval thus given it. For my part, I shall be glad to do what I can to further the work. At present several clubs publish lists of their own yachts; but unless a man belongs to them all, he has little or no chance of getting the books; and I confess that, valuable as the information would be to me, I cannot afford to pay some hundreds of dollars annually to obtain it. I have, in more than one instance, been favored by secretaries, who have sent me their club books, and to these gentlemen my thanks are tendered. If more would follow their example, they would confer an obligation which I should be glad to reciprocate in some other way.

Of the desirability of adopting a uniform system of classification, I have already written, and I hope before long to see something done in this respect. Classification hinges on measurement, and this has been a constant source of trouble, as nearly every club has its own rule and its system of time allowance. We want a uniform rule here also—a rule which shall, as far as possible, leave owners and builders unfettered, untrammelled, and yet which shall give a fair idea of the size of the vessel. I see one beauty about the Thames rule, now known as the Y. R. A. rule of measurement, with the change of taking the water-line for length—that beauty is, that it enables yachts to be easily classed. I know very well its disadvantages—they have for years been dwelt upon by writers, not only here but in Britain. I am not speaking of its accuracy or of its effects on models of yachts; all I aim at is to show its advantage in being uniformly adopted by English yachtsmen. I think that the moment you apply the Y. R. A. rule to American yachts you commit an injustice—it does not measure them fairly, not only in comparison with British yachts, but in regard of actual size. Therefore it will not do for us. We can never accept half the breadth as equal to the depth, and there is no earthly reason why we should. If depth is of value it should be taken into account. Neither do I consider measurement by length a just one—it is as bad in its way, as it tends to produce over beamy vessels; and measurement of cubic contents, sail area, and similar systems, I reject equally. In measuring yachts for racing purposes, and it is only in racing that time for difference of size has to be allowed, I contend it is the external dimensions that are required and that should be taken. In my humble opinion, and I give it only as an opinion, the whole length on water line, the whole breadth at, above, or below the water line, and the depth to bottom of keel should be the elements taken. As the rule must be simple to be generally adopted, make no allowances whatever in the way of reduction of beam from length. Every man might then build as he pleased, deep and narrow, broad and shallow, or moderately beamy and moderately deep. Classification would become an easy matter, and an American and a British yacht might be matched together on a rational basis and not on the basis of a rule which inflicts a heavy penalty on one or the other.

I am not going, inviting though the subject be, to enter upon the *vexata quæstis* of cutter *vs.* sloop. I have followed the phases of the controversy very closely, and am still open to arguments. Personally I prefer the cutter to the sloop for its rig, which I believe to be better fitted for outside work or racing in anything like wind or sea. At the same time, I do not want to cram my belief down any man's throat, or to say that the sloop is worthless. Its very good in its place—smooth water, and there, other things being equal, and a whole sail breeze blowing, with no necessity to reef, its single jib must be more powerful than a cutter's foresail and jib, though my own taste is in favor of the latter. For cruising and all work in which the weather has to be taken as it comes, I do not hesitate to say that the cutter's rig is the seaman's rig, and that the deep vessel is better than the shallow one. It is all very well to talk about sloops being dry in a seaway and cutters wet; but, after all, it is talk. Sloops are very wet if driven, cutters are dry if sailed easy. Force a boat through a head sea, and if she is fine forward, as many of our yachts are, she is bound to take water aboard. If she is bluff she will spank, and will not go ahead. Of the two, the wet craft that will make a port or claw off a lee shore, appears to me superior to that which will only lay-to on top of the water, slide to leeward, like a crab, and refuse to be driven when driving is the only safe course. The anti-cutter men say sloops are fast and cutters slow. What do they judge by? The *Saxon*? I know little of her performances, so leave her owner to answer. The *Enterprise*? That cutter has, I think, "licked" sloops in sloop's weather. Was there not a sloop *Sylvie*, big enough, too, that tried it on with cutters, and was badly beaten? But Mr. Centre settled that system of vilification of cutters by over-ardent enthusiasts who know little or nothing of them. Take performances, not imaginary, but recorded, and compare—that is the right way to do. There is room on God's ocean for both. If a man believes in the sloop, why by all means let him stick to it, and be yachtsman enough to allow his neighbor to take his pleasure in a decked craft fit to ride a gale out. There is no need to quarrel about it. The question of types and rigs can be discussed without that, and if the cutter men do laugh when the breezes blow and the sloops remain in port, why what does it matter? Does it make the sloop any less the great Panjandrum craft that can go anywhere and do anything? Not a bit of it.

Dear fellow-yachtsmen, let us write and talk cutter, sloop, schooner and yawl all winter—not much else is left us to do when Arctic weather prevails; when spring comes let us fit out and amicably race and cruise together to the greater glory of that noble sport whose welfare and progress we have all at heart. I'd go to sea on a plank, rather than not go at all, and that next season may see all good Corinthians afloat in staunch crafts, no matter what model or rig, so long as each man is satisfied, that we may all have a jolly good season, and that FOREST AND STREAM may long flourish to record our deeds on the briny, is the sincere wish of ROUGE-CROIX.

ERRATA.—In the first paper on the Past Yachting Season, page 889, line 47, read Pfaffs for G. Paffs; line 86, read abroad for aboard; line 95, read nothing for working; last line, read ten tonners for tonners. On page 935, in the third paper, read Count Bathyanny, for Batchquay, and *Vif* for *Vip*, also *Arnona* for *Arizona*. We are informed that the race of the Beverly Y. C., June 14, was given to *Fancy* in the second class, and not to *Hoiden*, as our correspondent "Rouge-Croix" has it.

Rational Pastimes.

THE GAME OF CRICKET.

ALTOONA CRICKET CLUB.

Through the courtesy of the secretary of the Altoona Club of Pennsylvania, we are enabled to give the official report for last season. The organization is composed mostly of new players, who, until last year never handled a bat, but if they continue to be associated with the several old Philadelphia stand-bys, whose names appear at the head of the batting list, it will not be long before they are well up in the game. Of the three games played, all were won. The following summary of matches with averages speak for themselves:—

SUMMARY OF MATCHES.

Date and Place.	*1st Innings.*	*2d Innings.*	*Total.*
May 20th, at Blairsville:—			
Altoona	63	55	118
Blairsville	54	43	97
Altoona won by 21 runs.			
June 21st, at Altoona:—			
Altoona	59	47	106
Blairsville	25	16	41
Altoona won by 65 runs.			
Sept. 13th, at Columbus, Ohio:—			
Altoona	52	64	116
Columbus	51	57 (9 wick's)	108
Decided by first innings in favor of Altoona.

ST. GEORGE'S CRICKET CLUB.

Below will be found the record of the fortieth season of the St. George's Club of New York, the Father of all cricket organizations in the United States. Of the twelve first eleven matches played, five were won, four lost two drawn on account of rain, and one tie game with the Albany Club. In the batting averages Mr. Moeran leads the van with 23.58, followed by Mr. Bance with 17.14. Mr. Moeran's score of 102 was the only century made in the country during last season. Appended will be found a summary of the matches, with averages, both batting and bowling, of those who took part in first class games:

SUMMARY OF MATCHES.

Date and Place.	*Sides.*	*First Innings.*	*Second Innings.*	*Total.*
May 17, at Staten Island	St. George's	36	66	102
	Staten Island	57	46 (5 w)	103
Lost by 5 wickets.				
June 4-5, at Hoboken	St. George's	43	76	119
	Young America	175	—	175
Lost by an innings and 56 runs.				
June 21, at Albany	St. George's	81	106	187
	Albany	44	65	109
Won by 78 runs.				
June 26, at Hoboken	St. George's	191	—	191
	Manhattan	131	33 (4 w)	164
Won by 60 runs on first innings.				
July 4, at Hoboken	St. George's	149	—	149
	Albany	149	—	149
Tie match.				
July 30, at Hoboken	St. George's	150	—	150
	Long wood	71	90 (3 w)	161
Won by 79 runs on first innings.				
August 14, at Hoboken	St. George's	106	105 (3 w)	212
	Paterson	69	—	69
Won by 37 runs on first innings.				
August 25, at Hoboken	St. George's	47	—	47
	Hamilton	99 (2 w)	—	99
Drawn on account of rain.				
Sept. 8, at Paterson	St. George's	35	29	64
	Paterson	34	32 (6 w)	66
Lost by 4 wickets.				
Sept. 12-13, at Hoboken	St. George's	25	35	60
	Gentlemen of Ireland	184	—	184
Lost by an innings and 124 runs.				

Date and Place.	Sides.	First Innings.	Second Innings.	Total.
Oct. 8-9, at Hoboken...	St. George's...	65	3 w	65
	Columbia College	63	—	63

Drawn on account of rain.

Oct. 22-23, at Hoboken.	St. George's.....	65	146	211
	Columbia College	28	—	28

Won by 37 runs on first innings.

J. T. Soutter	353	127	30	4	31.75
M. Egan	42	15	—	—	—

The following bowled in one innings only:—T. C. Richardson, H. Campbell, A. Lyon, J. B. Cashman, J. P. Conover, D. B. Gilbert and E. W. Sadler. The Second Eleven played eleven matches, of which it won six and lost five. The Juniors also played a match against the Staten Island Juniors, which was won by the latter.

PENINSULAR CRICKET CLUB.—The score books show that the Peninsular cricketers, of Detroit, made a fine record during the season. Nearly every player in the first eleven scored double figures, and, when it is considered that they met such formidable opponents as Daft's Team and the Gentlemen of Ireland, this proves the team to be very strong in batting. In bowling, Armstrong, Dale, and White were very effective. For the following batting and bowling averages, we are indebted to Mr. C. B. Calvert, the club's Secretary:—

BATTING AVERAGES.

Names.	Innings	Runs	Most in Innings	Most in a Match	Times out	Average
U. Armstrong	10	159	76	76	2	19.7
A. Treloar	4	77	29	29	0	19 1
J. Joy	3	38	19	19	1	19
C. B. Calvert	14	155	45	45	3	14.1
J. Neville	3	28	16	16	1	14

—The word "Shooter," as applied to cricket, is an Americanism.

ARCHERY.

PEQUOSSET ARCHERS.—*Boston, Dec. 26th.*—Christmas meet at Plympton Hall; 30 arrows each; ladies, 30 yards; gentlemen, 40 yards;—

	First Round.	Second Round.
Mr. Brackett	172	178
Mr. Plympton	125	116
Mr. Smith	128	174
Mr. Wardwell	143	134
Miss R. Wilson	93	124
Miss J. Wilson	164	132
Miss Smith	45	75
Miss A. Allen	40	83
Totals	861	1,017
	First Round.	Second Round.
Mr. Brownell	146	163
Mr. Lawrence	90	86
Mr. Worthington	99	182
Mr. White	105	121
Miss Worthington	142	124
Miss J. Allen	163	133
Miss Brackett	74	82
Miss Spencer	140	67
Totals	859	993

Two prizes, each a handsome ornamental target and easel, were awarded, one to Miss Worthington and the other to Miss Smith.

This indoor range is doing wonders for those of our archers who contemplate participating in the Eastern Archery Association tournament next season. Three of the gentlemen have already scored over 200 with 30 arrows at 40 yards. These, of course, were practice scores, and under favorable circumstances. Their modesty prevents the giving of names, nevertheless we think it a good showing for archers who have not yet finished their first season. Having a difficulty about seeing where the arrows hit when the hall is lighted during our evening shoots, we tried the experiment of a target facing with the heavy colors left out. We surround the solid gold with a narrow stripe of red, and outline the outer part of the red, the blue and black by a narrow stripe, say a quarter inch, of those colors on a white ground. This we think quite an improvement; we can see our arrows strike, and can much more easily concentrate on the gold than with the heavy circles of blue and black on the facing.

A. N. DREW.

NEW YORK ARCHERY CLUB.—The members of this club met Christmas Day and Saturday, Dec. 27th, for practice at their hall, corner of Ninth avenue and Twenty-seventh street, which had been kindly tendered them by Messrs. Johnson & Sheppard, proprietors of the Twenty-third street line of stages. The following are the leading scores, 90 arrows, 30 yards. Total score:—

Jas. W. Auten, Jr., 88 hits	496	Geo. H. Sheldon	224
John W. Sutton, 89 hits	476	Miss E. T. Morton	203
Geo. D. Pond	329	Mrs. Dr. DeLuna	203
Dr. A. B. DeLuna	313	Miss B. Howell	202
Dr. J. Elias Whitehead	300	Miss Fannie M. Wren	210
Juan F. Perez	225	Miss Julie E. Mauger	198

The ladies shot for the monthly prize, consisting of a fancy tassel. Mrs. Dr. DeLuna won the prize, the scores being handicapped. At the monthly meeting, held Saturday evening, Dec. 27th, four new members were added to the roll. The editor of the FOREST AND STREAM and Alexander Shaler were elected honorary members.

Although the club has a range of fifty yards in their present quarters, the members are shooting at 30 yards only on account of having received a challenge from the Ascham Archers, of Williamsburg, to shoot at that distance. The team of six, consisting of Dr. A. B. DeLuna, John W. Sutton, Geo. D. Pond, Jas. W. Auten, Jr., Mrs. Dr. A. B. DeLuna and Miss E. T. Morton, visited the Ascham Archers Tuesday evening, Dec. 30th, at 8 o'clock P. M., at their hall, corner of Division avenue and Clymer street, Williamsburg, where the match took place.

JAS. W. AUTEN, JR., Sec.

WABASH MERRY BOWMEN.—*Crawfordsville, Ind., Dec. 23d.*—The club held its first meeting for winter practice. The ground being hard frozen, and a cold wind blowing from the north, the archers were unable to do any good scoring. The following best scores were made at the York Round:—

	100 Yards.	80 Yards.	60 Yards.	Total.
Will H. Thompson	26 106	25—103	24—122	75—331
Maurice Thompson	24— 91	29—127	22— 98	74—316
John A. Booe	15— 43	20— 84	18— 66	51—193
Theo. McMechan	11— 47	24— 96	16— 48	51—191

During the winter, when the weather will permit, this Society will hold occasional meetings for out-door practice, they being unable to get a hall of sufficient length for in-door practice. There will be no regular appointed meetings for practice, but only when the elements are willing. The ladies will have no practice until spring.

SOME QUERIES ANSWERED—*Galesburg, Illinois, Dec. 6th—Editor Forest and Stream*:—1. Is it allowed to change the inclination of the target as one passes from the shorter to the longer ranges? 2. Is it allowed to shoot a few arrows before beginning a round, to get the range? 3. Is the same thing allowed in passing from shorter to longer distances upon the same round? 4. Is the same thing allowed in resuming the incomplete score of a previous day? 5. Are my arrows particularly bad, or my shooting them particularly vicious, that I can find no two that will fly just alike at the longer ranges? 6. Do any of our best archers practice at longer ranges than 100 yards?

I shot twenty-four arrows at 120 yards the other day with a stiff breeze blowing directly across the course, and made seven hits, 1, 3, 1, 5, 5, 5, 9—total 29. Next year we hope to have an archery club here in connection with the National Association.

T. R. W.

In answer to the above queries we will say that it is allowable to change the inclination of the targets as one passes from the shorter to the longer ranges, though we would suggest that the longest range is usually shot first, and this order was only changed at the National meeting at Chicago for peculiar local reasons.

To the second, third and fourth queries we answer that it is never allowable to shoot an arrow to get the range. The first arrow shot is scored.

To the fifth query we can only say, that if you have the best arrows of any first-class maker they will all have a like flight, if "loosed evermore alike."

To the sixth we answer, that many of our leading archers do occasionally practice at 120 yards, but few of them, indeed, would agree to equal the score of seven hits, 29 value, with 24 arrows. The Double York Rounds are also very fine records.

TEN DAYS AT FOREST LAKE WITH THE PEQUOSSETTS.

IT was in the quiet of a summer's evening that the idea was suggested. As the shades of night closed upon them, one by one the archers withdrew from the range, and joined the others on the seats near by, to spend, as usual, a short time in discussing such opinions and fancies as were presented at these times. The conversation turned to summer vacations, the beaches, excursions, camping out, etc.

"Wouldn't it be jolly for us all to go camping out?" said one of the ladies. "I'd like to try it."

"So should I; and why can't we?" said another.

"Well, who will go?" was the next question asked, and a count settled it, the result being four ladies and six gentlemen who were ready for the undertaking.

The ladies were duly and solemnly warned in regard to the uncertainties and discomforts of camp life, and as solemnly agreed to abide by the consequences. How they braved what did come was a matter of no little congratulation to those whose anxiety was aroused by the three days' storm, which set in on the second day of camp, and culminated in a severe gale during the afternoon and night of the fourth day.

Not to be talked out of the idea by making it a futurity, each one at once resolved himself or herself into a "committee of arrangements." B., the oldest camper of the party, drew up a list of requisites, and pledges for each duty or necessity were made.

To me fell the lot of engaging a cook. One was readily found, who as readily backed out on the day previous to our departure. Several hours of travel here and there through the hot streets of the "Hub," under the sun of one of the warmest of our summer days, was rewarded by the engagement of a person, upon whom, at our first meal in camp, the title of "Professor" was bestowed; and well worthy of it did he prove. Long will be remembered that form, shrouded by the white coat and apron, the black, shining, jolly face, surmounted by the white cap. Long live Wilson Sears, C. M., to gladden, by ministering to their stomachs, the hearts of those who may be blessed with appetites such as were found by us during our sojourn in the grove on the shore of Forest Lake.

Our camping spot was chosen for its accessibility, it being but ten miles from our town, with a railroad depot a mile and a half distant, where we could take the train for home or Boston, which was very convenient for those gentlemen who were obliged to go to the city at times during our stay; and with the several horses and carriages belonging to the party quartered at a neighboring farm-house, gave a feeling of ability to get away if we chose, which was, I think, quite a help to us in enduring the long, disagreeable storm which we experienced.

A large wall-tent for the ladies, another for the gentlemen, a small tent for the "Professor," awnings for the table, dresser and stove were quickly set up; crockery was unpacked; commissaries stowed away, hammocks swung, and a general getting ready for camp life took place. Three of the ladies arrived during these preparations, and took a hand in the arrangement of their tent. This gave us a party of six, besides the "Professor," the others not being able to leave on so short notice, but were to follow in a day or two.

Supper was ready by the time we had arranged our camp, and we were very ready for it. After supper a requisition was made for the boat brought by us. It was quickly placed in the water and occupied by four, while the two remaining reclined in their hammocks, and in a quiet lazy way enjoyed the situation.

The shades of night deepened upon us; one by one the stars came out, and could be seen twinkling through the openings in the trees overhead. In front, the camp fire, and beyond, through the fringe of trees, the quiet lake; while o'er the waters were wafted the songs of the rowers. Even now, as I think of it, the quiet happiness of that hour steals over me, and I give myself for the time to its influence.

The first night in camp is always a novelty, and especially to those who are taking their first experience in such life. Ours was no exception to the rule.

The camp cots, with which all were provided, though very comfortable, did not bring sleep with them. Conversation would quiet down time and time again; but the quiet would be broken by an exclamation from some one, to which all were ready to make answer. Many were the vows openly made respecting the drinking of chocolate, coffee, or strong tea at night, only to be forgotten the next day after the sleep which finally came to all.

The next day, Friday, I was to devote to fishing. The lake had been stocked some years since with black bass, and fishing permits were granted at one dollar per day. I went prepared to catch my first bass, but did not succeed in getting him into the boat. I fished all day long, trolling with flies, shiner, and spoon, still-baited with live bait and worms, but to no purpose save the strike of one while trolling. He shook clear at his second jump out of water. An abundance of food for them was to be found, so they were particular. Having had my money's worth of fishing, I wanted no more at that price, and for our prospective chowders an order was left at the village post-office for the fishman to call at our camp on his semi-weekly round.

Will P—— and "Brother Sam" arrived during the afternoon, necessitating the return home of Nat, the jolly boy of our party. Sam proved himself the boss at camp-fire building; his fire being the glory of the evening. By it we sat, sang, and told stories until a late hour.

The early morning of Saturday opened with the wind northeast, and a light rain, which continued to fall at intervals all day. Colonel B—— made us an early visit, driving up before, and stopping to breakfast with us. He brought a generous supply of fresh meat, vegetables, etc.

In the afternoon Ned drove up, bringing with him "Mr. and Mrs. Joe," and a load of eatables, including a large pot of baked beans, taken from the oven just before starting. These were quickly transferred to the oven of our stove and kept hot for dinner. The FOREST AND STREAM had been forwarded to me, and by our fire that evening we discussed the archery news and scores as we warmed up and dried ourselves for the night.

Sunday was one of those damp drizzly days when the thick mist drives along in heavy clouds, increasing now and then to rain. With rubber boots, coats, and other waterproofs, we spent most of the day beside the camp fire, waiting patiently for the weather to brighten. The evening was enlivened by singing and by listening to some of the southern camp meeting songs, rendered by the "Professor" who was raised in "Ole Varginny" in the genuine plantation tone. Two of these, "Don't be Weary," and "Winter's almost Over," were ninety-nine verses long, or less, and all like the first.

Monday morning the weather was the same, only more so, and the conundrum was anxiously asked—When will there be a change? Will and Dick drove home in the morning, and, finding the storm so severe in the afternoon, did not return. The wind and rain increased so much during the afternoon that all were obliged to seek shelter in the tents. B. drove over to the depôt with Sam, who was obliged to return home, and stopped at the post office, where it was learned that the barometer had been rapidly falling, and he returned to camp with the feeling within himself that there was to be "a night of it," and with, as he the next day confessed, some anxiety as to

at might be the result. Our dinner to-day was a six o'clock lunch, served in the tents. By dark it was blowing a gale. B. took upon himself to see everything secure, and we, not fully appreciating the situation, let him do it. He came in and reported that he had tried all the pegs, and had put out guys from the exposed corners to some convenient tree, and was asked, "What kind of a guy are you giving us now?" The wind whistled around us, with now and then an extra blast, which made the tent shiver and give as though about to fall. Every few minutes the crash of a falling branch would be heard, some very near, others far away. The leeward ends of the flies flapped and cracked, reminding me of the thrashing of the ropes and sails of a vessel during a gale at sea. A crash of dishes and the rattle of pans and kettles was heard and repeated. B. goes out to see what's the matter, and finds that the awning had blown down, and the poles fallen upon the table. The "Professor" was visited, and his welfare inquired into. "I's all right, but goodness! gracious!! golly!!! how it do rain," was his reply.

The evening was lengthened out with reading, cribbage, whist, sketching etc., till a very late hour, then, without removing any of our clothing, we lay down upon the cots, ready to turn out if necessary at a moment's notice, and make our way to the nearest farm house.

So the night wore on; the only real excitement was when B., who was sleeping with his weather eye open, discovered that Ned had fallen asleep and let the candle burn down into its potato socket in despite of the warnings that such would be the result if he did not blow it out. A call of "Ned," repeated louder and louder a number of times, received no response save a deeper breathing; the wick fell over into the wet straw, a weak flame and a stifling odor ascended. B., losing his patience, and determined to wake Ned to see the result of his carelessness, halloed "Fire!" This brought Joe up with a start; spreadeagle-like he cleared the two cots intervening, and landed on all fours over the smoking place, while Ned raised up and, with a yawn, asked "Wh-ats ther matter?"

About three o'clock there was a lull in the storm; all dropped to sleep, and woke to find the sun shining from a clear sky, and as bright and glorious a morning as man ever welcomed.

With the breaking of the storm a new life broke upon the camp. The three days left of the time which we had intended to remain seemed too short, and it was at once voted to extend the time four days, until the following Monday. Nat put in an appearance about ten o'clock, having walked up from home, and Dick and Will arrived later.

Some one may be able to tell where those days went to—I cannot. There was but one unfavorable condition: we could not get a good range for archery practice. Our targets had been taken along, but the best we could get was thirty yards. This did not induce us to much practice. We went for rest and recreation, and found it in swinging in the hammocks, riding, reading, rowing, berrying, etc. We took a tramp one day to Concord, stopped by the way at the site of Thoreau's house, near Lake Walden, visited his grave in the old burying-ground, taking as a memento a clover leaf and a blade of grass, and from the grave of Hawthorne a bit of evergreen; walked over the old battle-field where first our forefathers fought for independence; crossed the rustic bridge and gazed upon the monuments with thoughts of "a hundred years ago;" passed by the homes of the Alcotts, Hoar and Emerson, and in fact did Concord generally.

Our hours for meals were—breakfast at half-past 7, lunch at 12, and dinner at 5. The breakfasts were excellent, lunches good, and the dinners—well, I'll give you a "bill" of one, then judge for yourself; and here let me note one fortunate circumstance. Nearly every day some of our friends would drive out to see us, and, for fear that we might be hungry, would bring many good things to eat. For our sample dinner, there was tomato soup (made to order by a C. M.), cold tongue, ham and corned beef, roast beef, potatoes, sweet corn, sliced and stewed tomatoes, cucumbers, bread and butter, crackers and cheese, pickles, limes and olives, fried mush and syrup, doughnuts and Washington pie, tea, coffee, chocolate and milk, blackberries (picked by the ladies) and cream, peaches and cream, watermelons and grapes.

What an appetite one has in camp! Even the dyspeptic can spread over a large part of such a dinner without those dreaded pangs which would be sure to follow an indulgence to such an extent anywhere else.

The early evenings were spent rowing on the lake, while later we gathered around the camp-fire, where stories, songs and recitations were in order. Then we would induce the "Professor" to sing some of his camp-meeting songs, which he would render with appropriate enthusiasm, seeming lost to all else for the time.

For a wonder, there were no mosquitos or flies to trouble us, though they were partially represented by the honey bees, who made the acquaintance of some of the party, but were most partial to the "Professor."

Day by day passed, quickly and pleasantly, and the time for breaking up was at hand. Having determined on a general jollification for the last Saturday evening, preparations were accordingly made. About forty Chinese lanterns were obtained, the dealer in our town visited, and his overlying stock of "Fourth of July goods," consisting of red and blue lights, Roman candles, rockets, crackers, etc., purchased by the lot.

At early candle light the illumination was inaugurated; later in the evening the pyrotechnic display took place. The rockets and Roman candles were set off from the boat out on the lake, and gave a fine effect in their reflections in the smooth water, while the colored lights gave a correspondingly pretty effect in our grove.

With the fireworks were a number of cannon-crackers. These were taken and secreted by one or two of the boys, who were in for some fun. One of our camp fire seats was a half of a barrel, and in its sides were one or two small holes. For a long time Joe endeavored to have that seat occupied by Sam, who, though not knowing of the crackers, smelled a mouse, and was very wary. While he was thus endeavoring to beguile Sam, the others were counterplotting each for himself, the sequel of which was that all the boys were successively elevated from that precarious seat by the explosion of one of those cannon-crackers within, Joe being the first victim and Sam the last. It was quite late. The fireworks exhausted; the candles had burned out in the lanterns, leaving us in a darkness relieved only by the smouldering camp fire, and a half hour had passed without an explosion from an unexpected quarter. Several adjourned to their tents preparatory for the night. Sam ensconced himself on that treacherous seat and meditatively watched the fading glories of his charm—the camp fire. To those on the opposite side of the fire there appeared a shadowy something, seeming to grow from the darkness directly in Sam's rear. The situation is taken in, and he is kept in conversation. The shadow grows to a substance as it advances inch by inch, revealing Joe in the most humble of attitudes. Unconsciously Sam assists the denouement. Taking his pipe for a quieting smoke, he leans forward and is lighting it with a coal of fire, when rip! bang!! up flies his seat, and higher rises Sam—hat one way, pipe the other; he shoots over the fire, landing in the midst of those opposite, when their light board seat gives way, and down go all together, to roll with paroxysms of laughter; while Sam slowly picks himself up with the exclamation, "Thunder and Mars! Well I'll be licked if you didn't play it on me after all!"

A quiet and enjoyable Sunday followed, indeed we enjoyed, with but few exceptions, every hour of the time. Each had their individual experience, which, I doubt not, will be remembered as bright leaves in their book of life, as reviewed in later years. I often think of the benefits to mind and body so many in our land might enjoy, if they only knew the pleasures of such a rest and relaxation for a week or two from the cares of business or home. I have camped in Michigan, the Adirondacks, at Rangeley, with guides, and with the romance unadulterated, but never have I realized such comfort as during our ten days at Forest Lake.

A. N. DREW.

IMPROVED BATHING.—The insufficiency of the ordinary bath is conceded. Let those who have just taken their ordinary bath rub their skin with the tips of their finfiers, and it will be seen that the scarf skin will come off in dirty granulations, thus proving the insufficiency of the simple bath. The pores are yet clogged. To remove this dead skin (so to speak) something is necessary. After much investigation and numerous experiments, the desired result has been reached, and we are able to recommend to the use of the public, who desire an enjoyment of healthy action of the skin, and especially those whose sedentary occupations result in imperfect action of the pores, the wonderfully efficacious article, Weston-Rowell-ene, which tones and invigorates the entire system, lessening liability to ill-effects of sudden changes of temperature natural to our climate. A sample will be sent to any one by addresssing, enclosing twenty-five cents, 881 Sixth avenue.—[*Adv.*

MARYSVILLE, Cal., *Dec. 15th.*

W. H. Holabird, Esq.:

DEAR SIR—The suit came to hand last night, and I am well pleased with it. You have made decided improvements in the make and cut of the same. In the hunting coat particularly, in the placing of the pockets and game sack. In fact, friend Holabird, you are making a suit now which, in my opinion, *cannot be beat for the price*, and I think *I know* what I am talking about, having used the gun and hunting suits for some twenty-five years. And by the bye, if I recollect aright, and I think I do, I have used the last suit I bought of you for over five years, and no easy use of it either, for I hunt a good deal. Wishing you success in the business, I remain,

IKE N. ALDRICH.—[*Adv.*

Forest and Stream and Rod and Gun.

AS WE do not employ any authorized agents or canvassers, we offer our friends in every locality who will give any time or attention to collecting and forwarding subscriptions, the following inducements to obtain subscribers for the "FOREST AND STREAM" at the rates and commissions given below:

Collect Subscription price,	3 months, $1.00		6 months, $2.00		1 year, $4.00		2 years, $7.00		3 years, $10.00
Commission to be retained,	3 " .25		" .50		1 " 1.00		2 " 1.50		3 " 2.00
Amount to remit us,	3 " .75	6 "	$1.50	1 "	$3.00	2 "	$5.50	3 "	$8.00

In Addition to the above Commissions, we offer the following CASH PREMIUMS:

To the person sending us the largest amount of money obtained from new subscribers, whose names are not now on our books, at above net rates, between January 1, 1880, and July 1, 1880,	$100.00
To the one sending the next largest amount, in accordance with the above conditions,	75.00
To the third on the list,	50.00
And to the fourth,	25.00

Subscriptions may begin at any time during the year, and may run for any length of time, but no subscription will be entered on our books until the money for the same has been received at this office.

No commission will be allowed on the first SINGLE subscription, but the commission due on the first two subscriptions may be deducted from the second, and thereafter the commission which you retained on each succeeding subscription. You are sure of the commission which you retain, and also have an equal chance to get from $25 to $100 of the cash premiums in six months.

To any Person sending us before July 1, 1880, two new subscribers for one year, or four new subscribers for six Months, and Eight Dollars Cash, we will send, in place of commission, any one of the following Articles:

Jordan's Manual of Vertebrates.
A Copy of FOREST AND STREAM for one year
A three-piece double ferule, lancewood tip, full mounted, polished Bass, Trout or Bait Rod.

Coues' Key to North American Birds.
One Fishing Outfit, consisting of Rod, Reel, Line, Snells, Hooks.
One Russia Leather Fly-book, and one dozen assorted Flies.

One five-feet lancewood Bow, Horn Tips, and one dozen 25 inch Arrows.
One pair Club Skates.

To any Person sending us, before July, 1880, Sixteen Dollars cash, and Four New Subscribers for One Year, or Eight new subscribers for six months, we will send, in place of commission, any of the following Articles:

Two copies of Forest and Stream for 1 Year.
A four-piece, double ferule, guides and reel-band, hollow, butt, extra tip, full mounted, Bait or Brass Rod.
One 3-piece do. Fly Rod.

A good Fishing Outfit, consisting of rod, reel, line, hooks or flies and snells.
One full-length Fly Book, and two dozen assorted Flies.
Coues' Field Ornithologh.

One Gent's six-foot self-lancewood Bow, made to weight and one dozen half-notched polished Arrows.
One Set Parlor Archery, complete in box.
One pair nickled-plated Club Skates.
One Parlor Air-Gun.

Sample Copy, Subscription Blanks and a handsome Show Card (to be posted in a conspicuous place) sent free on application.
Write your name and the name of the person to whom the paper is to be mailed, plainly, and do not forget POST OFFICE ADDRESS, TOWN AND STATE.
Remit, if possible, by postal money order, check, or draft on New York, payable to order of FOREST AND STREAM PUBLISHING COMPANY. If neither money order nor draft can be obtained, enclosed money in Registered Letter. Address

NEW PUBLICATIONS.

CAMPS IN THE CARIBEES: The Adventures of a Naturalist in the Lesser Antilles. By Fred. A. Ober. Lee & Shepard, Boston, Publishers.

Just one year ago we promised our readers that our special roving commissioner, "Fred Beverly" (as he is best known), would soon give them a book recounting his two years' experiences in the "Lesser Antilles," whither he had gone to study the avi-fauna of the country, and collect landscape views and general notes. He has now completed his work—a beautiful illustrated crown 8vo volume of 350 pages, replete with strange narratives, gracefully presented in most attractive form and color of language, and deserving a place not only in the library of every naturalist, but of every one fond of natural objects. We can hardly imagine a more interesting field of scientific pursuit than those Windward Islands; yet, when we open the pages of this book, we do not wonder at the selection of the author, or his determination to re-visit them some day hence and complete his investigations. Weird scenes and strange creatures greet the traveller at every turn—tropical in character, it is true, but not of the tropic stereotype with which we are so familiar. Beetles as long as your hand, the biggest in the world, grow there. Processions of crabs march up from the sea by millions at stated seasons, and in the spring march down again. There are boiling lakes of water; mysterious, lonely birds, which live only on mountain tops, where they are often heard, but never seen; another bird called "Le Soliel Coucher," which sings only at sunset and sunrise; ancient sacrificial stones covered with hieroglyphics; fair Carib girls, with blonde hair fully down to their feet; huge vampires, less pleasant to meet; roots which are deadly poison when raw, but wholesome and nutritious when cooked; and a thousand other objects of like interest.

But the writer's notes are not all of wilderness places, by any means. There are pretty towns and cities, like those of Basseterre in Guadaloupe and St. Pierre in Martinique, with well-lighted stone piers, quays shaded by trees, pure water conduits through the streets, handsome shops and houses, and every evidences of polite and good society. There are memorial temples and statues, lagoons like those of Venice on which barges float beneath overhanging trees, shaded avenues, and iron-fenced parks.

Throughout all the book there runs a remarkable vein of dry humor, which not only helps to diversify it, but keeps the reader on tiptoe for something still more quaint to come. The author always pokes fun at his own misfortunes, and treats mishaps as if they were mere little side shows all down in the bill, and the play would not be complete without them. In the appendix is a list of twenty new varieties of birds discovered by him. Altogether the book is most creditable to the author. We trust it may prove as remunerative.

PRACTICAL TAXIDERMY AND HOME DECORATION: Together with General Information for Sportsmen. By Joseph H. Batty; 125 Illustrations; New York: Orange Judd Company, 245 Broadway, 1880.

Mr. Joseph H. Batty has been a taxidermist for sixteen years. He was the official taxidermist of the Northern Boundary Survey; has spent months in collecting specimens of game, and has filled orders for several of our most important scientific and educational institutions. His book on "How to Hunt and Trap," has already taken the highest place among books of its class, and we predict a like success for the volume now before us. Mr. Batty is a very practical man. He has prepared this manual of instruction in his art, because he has recognized the need of it. It is a thorough work, written by a taxidermist for taxidermists. We have no hesitation in pronouncing this the very best work on the subject now published. The many enquiries we are receiving for instructions evince an increasing interest in this beautiful art, and it gives us much pleasure to recommend to all amateurs the "Practical Taxidermy." The illustrations are copious and judicious, and the text plain and intelligible.

—Mr. Chas. Lauman, well known to the readers of FOREST AND STREAM as an enthusiastic sportsman an entertaining writer, has just performed a great of love in preparing the life of Octavius Perinchief, subject of the memoir was a most remarkable man Episcopal clergyman who suffered mental and phy agony in the extreme. We spoke of Mr. Lauman's labor of love, and we may further explain that he written this book for the benefit of the destitute wi and orphans to whom the proceeds go. It is publis by James Anglim & Co., Washington. We need suggest that Mr. Lanman's friends should aid him in t aiding his friends.

COL. J. B. OLIVER.—That very prosperous and ably edited journal, the *Mining Record*, has recently added an Iron Department to its pages, and placed Col. J. B. Oliver in charge. Mr. Oliver was the founder and first proprietor of that excellent monthly, the *Florida New Yorker*, and shows abundant capacity for his new field of labor. The Iron Department of the *Mining Record* is certainly one of its leading features.

THE MINOR PLANETS.—Of the two hundred and nine minor planets now known, one hundred and fifty-five have been discovered by ten astronomers. The list is as follows:—Peters, 38; Watson, 23; Palisa, 21; Luther, 20; Goldschmidt, 14; Borrelly, 9; Hind, 9; De Gasparis, 7; Prosp. Henry, 7; and Hogson, 7. The whole number of discoverers is thirty-three.

BREEDING KENNEL
—OF—

M. P. McKoon, Franklin, Delaware Co., N. Y.

I KEEP ONLY COCKERS of the finest strains. I sell only young stock. I guarantee satisfaction and safe delivery to every customer. These beautiful and intelligent dogs cannot be beaten for ruffed grouse and woodcock shooting and retrieving. Correspondents inclosing stamp will get printed pedigrees, circulars, testimonials, etc. j10

Imperial Kennel

Setters and Pointers thoroughly Field Broken. Young Dogs handled with skill and judgment. Dogs have daily access to salt water.

N. B.—Setter and Pointer puppies; also, broken dogs for sale; full pedigrees. Address H. C. GLOVER, Toms River, N. J

FOREST AND STREAM KENNEL. Llewellin setter, Rattler, in the stud. Rattler is a handsome blue belton, black points, winner of four bench prizes; sire, Rob Roy, he by Laverack's Fred, out of Slatter's Phœbe, founder of the field trial strain, winner of five English field trials, out of pure Laverack imported bitch Pickles; she by Llewellin's Prince, winner of two firsts and three championships, out of Llewellin's Lill II.; no better blood in America. Will serve bitches at $15. Litters warranted. I am breeding to Rattler the following bitches:—Mell, a beautiful blue belton, black points, sire Jack, dam Spot, winner of first and second specials at Detroit, Mich., 1879, also first at Boston 1879 in native classes; Fly, a very fine roan belton bitch, sire Shot, dam imported Fannie; Pat, orange and white, out of Belle, by Royal George. Puppies bred from above, fine stock, for sale cheap. Address, with stamp, L. F. WHITMAN, Detroit, Mich. Dec1l,tf

Dr. Gordon Stables, R. N.

TWYFORD, BERKS, ENGLAND,

Author of the

"PRACTICAL KENNEL GUIDE," &C.

begs to inform Ladies and Gentlemen in America that he purchases and sends out dogs of any desired breed, fit for the highest competition.

N. B.—A bad dog never left the Doctor's Kennels. dec19 tf.

FOR SALE.—Two Gordon setter bitch pups; full-blooded; perfect black and tan; six months old; good sire; with pedigree on both sides. Also one Gordon setter dog, two years old; winner of first prize on the bench; perfect black and tan, and a perfect field dog; all broken, with a full pedigree; a rare chance for a good dog. Enquire of CHAS. T. BROWNELL, P.O. Box 350, New Bedford, Mass. Nov27

LAVERACK BLOOD FOR SALE.—Pups by the renowned sire of prize-winners, the pure Laverack setter dog Carlowitz; orange and white ticked, lemon Belton and chestnut Belton; dams of whelps from prize-winning stock; whelped July 3d and July 12th; price lower than the lowest. The Kennel.

Train Your Own Dogs.

BY THE USE of M. Von Culin's patent Spike Collar, dogs of any age, no matter how old or stubborn, can be most thoroughly trained in a fraction of the time required by any other method. I have trained dogs broken of all faults, no matter how long practiced. Dogs broken of bird biting, gun-shyness, whip-shyness, shot-breaking, unsteadiness on the point, chasing birds and rabbits, hedge hunting. Any dog, old or young, taught to retrieve (put in your hand) as a duty, no play; to point game, to back-stand, drop to shot, hand, wing and word, to quarter his ground, and work to hand and whistle. To hunt up headed for live game and for foot scent in retrieving cripples.

DISTEMPER AND WORMS.

Distemper and worms kill more dogs than all other diseases combined. Learn how to prevent and cure. Send 25 cents for 70 page book on treatment of all dog diseases.

Send 2ct stamp for letters from sportsmen in all parts of America, who have used my collar. Price with book of instructions post paid $3. Address M. Von Culin, Delaware City, Del.

All lovers of dogs and horses should send for the "Kennel and Field," full of rich information on training, breeding, care, etc. Treats of all cases of dogs, and full of information which can be gleaned from no other source. Price only 50 cts. Address

This cut is a fac-simile of the **Sportsmen's Chain**, patented by N. M. SHEPARD, April 15, 1879. This Chain will be made from the very best quality of ROLLED GOLD PLATE, or what is known as Gold Filled, and will be warranted to wear equal to a Solid Gold Chain from four to six years. The retail price will be $8 each. Liberal discounts to Clubs or Societies ordering twelve or more at one time. Emblematic for Pigeon, Glass Ball or Target Shooting, consisting of Shot, Shells, Cartridges, and a Gun or Rifle for bar, will also be made of Solid Gold upon application, at the lowest market price.

PATENTED
APRIL 15, 1879.

CAPT. A. H. BOGARDUS, Editor of FOREST AND STREAM AND ROD AND GUN, says: "This Chain is pronounced by every sportsman who has seen it the handsomest thing of the kind ever placed before the public. Parties can rely strictly upon uniform quality and a good chain for a little money."

A large assortment of Shell, Shot and Cartridge Charms at low rates.

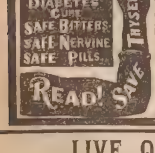
WARNER'S SAFE BITTERS



In eliminating the impurities of the blood, the natural and necessary result is the cure of **Scrofulous** and other **Skin Eruptions & Diseases** including **Cancers, Ulcers,** and other sores.

It is the best **Blood Purifier,** and stimulates every function to more healthful action, and thus a benefit in all diseases.

Dyspepsia, Weakness of the Stomach, Constipation, Dizziness, General Debility, etc., are cured by the **Safe Bitters.** It is unequaled as an Appetizer and Regular Tonic.

It is a medicine which should be in every family, and which, wherever used, will save payment of many doctors' bills.

Bottles of two sizes; prices **50 cents** and **$1.**

"THE FISHING LINE."

TAKE THE

Grand Rapids & Indiana R.R.

Mackinaw, Grand Rapids and Cincinnati Short Line

FOR THE

Trout, Grayling, and Black Bass Fisheries,

AND THE

FAMOU SUMMER RESORTS AND LAKES OF

NORTHERN MICHIGAN.

The waters of the

Grand Traverse Region

and the Michigan North Woods are unsurpassed, if equaled, in the abundance and great variety of fish contained.

BROOK TROUT abound in the streams, and the famous AMERICAN GRAYLING is found only in those waters.

The TROUT season begins May 1 and ends Sept. 1.

The GRAYLING Season opens June 1 and ends Nov. 1.

BLACK BASS, PIKE, PICKEREL and MUSCALONGE, also abound in large numbers in the many lakes and lakelets of this territory.

The sportsman can readily send trophies of his skill to his friends or "club" at home, as ice for packing fish can be had at many points.

TAKE YOUR FAMILY WITH YOU. The scenery of the North Woods and Lakes is very beautiful; the air is pure, dry and bracing. The climate is peculiarly beneficial to those suffering with

Hay Fever and Asthma Affections.

The hotel accommodations are good, far surpassing the average in countries new enough to afford the finest of fishing.

During the season Round Trip Excursion Tickets will be sold at low rates, and attractive train facilities offered to Tourists and Sportsmen.

Dogs, Guns and Fishing Tackle Carried Free at owner's risk.

It is our aim to make sportsmen feel "at home" on this route. For Tourist's Guide (an attractive illustrated book of 80 pages), containing full information and accurate maps of the Fishing Grounds and Time Cards, address A. B. LEET, Gen. Pass. Agent, Grand Rapids, Mich.

GUNPOWDER.

DUPONT'S

RIFLE, SPORTING and BLASTING POWDER.

The Most Popular Powder in Use.

DUPONT'S GUNPOWDER MILLS, established in 1801, have maintained their great reputation for seventy-eight years. Manufacture the following celebrated brands of Powder:

DUPONT'S DIAMOND GRAIN,

Nos. 1 (coarse) to 4 (fine), unequaled in strength, quickness, and cleanliness; adapted for Glass Ball and Pigeon Shooting.

DUPONT'S EAGLE DUCKING,

Nos. 1 (coarse) to 3 (fine), burning slowly, strong, and clean; great penetration; adapted for Glass Ball, Pigeon, Duck, and other shooting.

DUPONT'S EAGLE RIFLE,

A quick, strong, and clean Powder, of very fine grain for pistol shooting.

DUPONT'S RIFLE, FG, "SEA SHOOTING," FFG and FFFG. The FG for long range rifle shooting, the FFG and FFFG for general use, burning strong and moist.

SPORTING, MINING, SHIPPING, and BLASTING POWDERS of all sizes and descriptions. Special grades for export. Cartridge, Musket, Cannon, Mortar, and Mammoth Powder, U. S. Government standard. Powder manufactured to order of any required grain or proof. Agencies in all cities and principal towns throughout the U. S. Represented by

F. L. KNEELAND, 70 Wall Street, N. Y.

N. B.—Use none but DUPONT'S FG or FFG Powder for long range rifle shooting.

THE HAZARD POWDER COMPANY

MANUFACTURERS OF

GUNPOWDER.

Hazard's "Electric Powder."

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. *only.*

Hazard's "American Sporting."

Nos. 1 (fine) to 6 (coarse). In 1 lb. canisters and, 6½ lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shot guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6½ and 12½ lb. kegs. Burns *slowly* and very clean, shooting remarkably close and with *great penetration.* For field, forest, or water shooting, it ranks any other brand, and it is equally serviceable for muzzle or breech-loaders.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG in kegs of 25, 12½, and 6½ lbs. and cans of 5 lbs. FFFG is also packed in 1 and ½ lb. canisters. Burns strong and *moist.* The FFFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard *Rifle* Powder of the country.

Superior Mining and Blasting Powder.

GOVERNMENT CANNON and MUSKET POWDER; also, SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF, MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents, in every prominent city, or wholesale at our office,

88 WALL STREET, NEW YORK.

JOHN THOMPSON'S RIDE.

YOUNG John Thompson is riding down
Through the woods that skirt the town;
The cheerful sunlight around him weaves
Its fairy tissues in through the leaves,
And the waving shadows play and dance
Wherever the golden arrows glance.

There was something said by the playful breeze
To his soul that gave it a sweet heart's-ease:
A whispered word that the wind let fall,
Of her who was dearest to him of all—
So he sang to himself in a pleasant way,
As he rode to his tryst on that clear June day.

The birds sang up in the trees above,
The hum of the bees was full of love,
The flowers smiled as he passed them by,
And his own heart made them a soft reply;
For love and beauty and song are one
To the thoughts that on Cupid's errands run.

A garrulous brook that murmured through
The moss on which yet hung drops of dew,
Went laughingly down the rocks among,
Where it rippled and prattled the whole day long;
The same in shadow, the same in sun,
For sunshine and shade to the loving are one.

Before him the meadows were fresh and green,
And the road ran winding along between
Tall rows of maple and elm and beech,
Whose branches his hand could almost reach,
And the white church steeple with gilded vane
Shone bright at the end of the leafy lane.

Past the church door and over the hill,
Across the bridge by the old grist mill,
He rides and he whistles right merrily,
As his "Old Brown" jogs along lazily,
Till the roadway turns, and he sees beyond
A glimpse of the farm-house by the pond.

Under the roses a maiden stands,
With her blue eyes shaded by her hands,
And she looks at the turnpike from the town,
For a certain young man coming down,
And a glad smile plays on her features fair
At the sight of the horsemen riding there.

Although the figure she scarce can see,
She knows in her breast that it is he,
And under her bodice her little heart
Sends the blush to her cheek with a sudden start,
And the tell-tale color comes and goes
Like the tint on the leaf of the summer rose.

Her father's acres are nothing now;
Nor the herds of cattle that graze below;
Nor the well-stored barns, nor the ripening grain,
Which, when the wind hisses across the plain,
Like the waves of ocean rise and fall—
For young John Thompson is more than all.

And the young man knows it. Therefore he rides
In quest of the loveliest bride of brides,
Whose brown eyes won him; whose forehead fair
Is crowned with a wealth of auburn hair,
And up from his bosom there comes a sigh,
When he thinks of the church he has just passed by.

No panting charger, foam-flecked, he rides,
To turn the terrible battle tides;
No hurried warning the midnight fills—
"The dam has burst—to the hills! to the hills!!"
For war and disaster from him are far
As the Southern Cross from the Polar Star.

As clear as the heaven that bends above—
Pure as the breath of a snow-white dove—
Soft as the wind o'er the grass that slips,
Are the eye and the heart and the crimson lips
Of her who waited that afternoon
In the shade of the porch in the month of June.

No glory wrung from a doubtful strife—
No threatened danger to limb or life—
But calm as the water in sylvan shade,
He passed on his way through the tuneful glade;
With calm below him and m above,
Was his soul at rest when ode for love.

FRANKLIN W. FISH.

Nepigon Lake and River.

NUMBER V.

FOR miles on our way the next morning the lake seemed to be getting gradually shallower. Two or three small streams found their way from the hills, but they were the veriest brooklets. Occasionally little bays, with growths of rushes, reached into the lower shores, hinting of wall-eyed pike and pickerel. Now and then we would pass a low rocky bluff, and as we went on, the tall grass growing a mile from shore would catch the paddles and the sandy bottom would come so close to the canoe as to threaten our further progress. When we reached the most northerly point of the lake the water became so low and shallow that the men waded ashore, pulling the canoes to some boulders, of which we made stepping stones to the land. We estimated this point to be latitude 50 deg. 35 min., with a possible error of two or three minutes. The country lying back of the lake to the west and north was low, but gradually rose inland. To the east the shores looked high and rocky.

About four miles to the southeast of the point where we landed we came abreast of the mouth of quite a large river, whose dark waters reddened the lake for miles. Looking up the stream, its banks were lined with trunks and roots of large trees, and within sight a pile of drift wood extended from bank to bank. Its evidently dangerous navigation had no charms for us, and Wassy's account of an ascent made a few years before did not lead to a desire to explore it. "It was full of pickerel (Ogah)," he said, "and two hard days to get to the falls." So, whether wisely or not, we passed it by, and in a few miles of southeasterly course we came to a long low point of smooth granite rock, reaching out towards a large island, behind which we, for the first time since we passed them, lost sight of the "Two Barns." A heavy swell came in from the south, but as our afternoon course lay for the most part behind some islands we did not heed it. Although the sea came from the south, the breeze seemed to be coming from the northwest, and we began to fear we should hardly be able to cross Ombabika Bay that night. Our afternoon sail was delightful. We tried fly and spoon in vain between the islands, and in crossing the small bays that here and there lay between the spurs of the increasing hills. Land and water seemed destitute of animal life, save a solitary blue heron, at which we tried an ineffectual shot, and a white-bodied eagle or osprey which flew over us. We passed the narrow strait between the lake and the great bay, and almost before we were aware of it the "traverse" was right before us. A high mountain with inaccessible front was at our right, and the long stretch of twelve miles of water up to the northwest to our left, was bounded by high and forbidding hills, and terminated by still higher land. Past the mountain the bay extended southeast for four or five miles. The chop seas close by the mountain were neither safe nor pleasant, and though the white caps were rather threatening, we pushed on towards some low islands lying near the further shore. The clay color of the water, so different from anything heretofore seen in the lake, revealed the shallow depth as well as the character of the bottom of the bay, and a sounding nearly two miles from land did not surprise us when it showed a depth of only thirteen feet. And even here tall grass grew to the surface, though not in thick masses. The thermometer showed a temperature of 65 deg. when immersed in the water, and in Ombabika river of 68 deg.

We camped at the fall a half mile from the mouth of the river, taking a few wall-eyed pike on our way up. An Indian camp which we had passed lower down soon sent up a deputation, which brought a fine fifteen pound muskalonge, taken in a gill net just in the entrance of the river. In the morning, after trying for trout, we started out, but could get no further than one of the islands near by, as the wind which had kept up all night made progress dangerous if not impossible. Trying our spoons in the river for pastime that evening, we took in half an hour thirty wall-eyed pike averaging over three pounds each.

The island upon which we stopped had been the place of a hunter's camp the preceding winter, and we found upon it a roll of birch bark containing a fur cap and a set of dog harness and bells, left there for his return in the fall. A voluble half-breed speaking only the Indian tongue had the camp near by. He had more than the usual thrift, and boasted his good wall tent and two or three birch bark wigwams, as well as rejoiced in his three wives and numerous children and dependents, including what sounded like a score of dogs. He seemed to want for nothing, but was not above taking a square meal with his newly-made friends. He was bound up the river to St. Martin's Falls on the Albany River, which empties into Hudson's Bay.

The height of land or water shed between the St. Lawrence, or lake system, and Hudson's Bay, is about fifty or sixty miles from where we were, with practicable canoe navigation and portages, but which is not much used of late years.

It was afternoon of the next day that we left Ombabika River and Bay. We had been nearly two days windbound. Passing through the narrow strait, we took our way southalong the rocky coast, following closely the line of the shore, so as to take advantage of every projecting point which sheltered us from the sea and southerly wind. The islands along the east coast are less numerous than on the west, and lay further from the main shore. The central portion of the lake is most thickly studded with islands, to judge from mere appearances. How many there are only an accurate survey could determine. At any time we could count, looking out from the shore, from thirty to fifty plainly to be distinguished.

We camped that night on a beautiful projecting point of open land which had been used the preceding winter for an Indian camp. The poles of several wigwams were still standing, and the skulls of various animals were hung to the trees or stuck upon the the tops of tall sticks planted in the ground as trophies of the hunt. The frame of the "sweat house" was left, and within it the stones last used to raise a vapor bath. But it seemed that this simple remedy had not proved efficacious, for just within touch of one of the wigwams was the rude temporary tomb where the remains of the dead had been left until the milder season admitted an earth burial. It was an enclosure about five and a half by two feet, and two and a half feet high, with a gabled roof, built and covered with logs notched and fitted so tightly together that wild animals could not penetrate it. A bed of fir boughs lay on the ground within, and the smaller logs across the top had been covered with the same material.

An early start the next morning was none too early, for by the time we reached the long point which projects southward, forming a deep bay separated from Ombabika Bay by only three or four miles of low land, the sea had become so heavy that we passed it with difficulty, and hurried into the shelter of some islands. It was at this place we saw the large trout I have previously mentioned.

From here to Poplar Lodge River the scenery was varied and picturesque. The bold shores and rocky islands were like those of the west coast of the lake, except that the hills were not so verdant, nor the timber as large. In many places the white granite rocks, from which even the moss had been swept by devastating fires, were the most marked feature. Poplar Lodge River is quite a large red stream of 68 deg. to 70 deg. temperature, and has its rise in the height of land between Nepigon and Long lakes. In the old times of rivalry in trade there had been a post here, the buildings of which we visited, but as they did not offer the comforts of a tent, we camped lower down near the lake, taking on our way back a few pike for our suppers. There were numerous fox tracks on the sandy beach, and Wassy said it was fine trapping ground in the winter. We were now about fifty or fifty-five miles east by south of Nepigon House, and the great island where we had rested on our upward trip lay between, in plain view.

I wish I were able to describe the glories of the next day, so that the reader of these sketches might have a faint imagining of the wonders of the lake and sky as they appeared to us. We left the river about nine o'clock in the forenoon, intending to make twelve or fifteen miles, so that another half day's work would bring us to the place where the lake finds its outlet over Nepigon Falls. Since the day we reached Nepigon House the barometer had not once been above twenty-nine inches, and as may be surmised, we had met with frequent storms. But this day a slight upward change from last evening, and a morning air so transparent that islands miles away looked so near we felt we could almost touch them, led us to the hope of one whole calm, bright day before we left the lake. The wind was light, and off the land—a "lee wind" Louis called it. About 11 o'clock groups of cumulus or summer clouds began to appear, and in half an hour extended their regular forms clear across the heavens, flecking the breeze, touched water, and darkening the verdure of the hills and islands with their moving shadows. They seemed to radiate from a cloudless open point in the east, and probably from the perspective they appeared ranged in columns, like white-plumed battalions of a great army, marching on either sides of us in review, or like finely-wrought lace-work, with open spaces containing the sky. The line of clear blue along which the columns seemed to march extended from the east over and beyond us, until, far down in the west, they gathered in dense masses, shutting out the sky from sight. Such a scene upon canvas would be called unreal, but it was a reality, notwithstanding. For an hour we

watched the march of these white-plumed cloud battalions, and saw them gather and concentrate their forces in dark and solid masses in the west, until the muttering of distant thunder reached our ears, like the roar of a great battle. When this came we crept closer along the shore, or watched for a new landing place upon intervening islands. The rain soon visited the distant heights, and the clouds finally hid them, and we could see the columns of the storm advancing against the wind, the falling rain bent and twisted by the gale. It brought to mind with a clearer appreciation of the poet's accuracy of description—I think it was Byron—the lines then, as now, quoted from memory :—

> "When Liberty, with banners torn, but flying,
> Streams like a thunder cloud against the wind."

The roar of the storm came nearer, and the harsh black line it marked upon the water came closer and closer. We hurriedly pulled up our canvas in a sheltered island bay, covered our provisions, and let it rain. Again and again that day did the storm advance and retreat. We could see the lashing of the waves, the flash of white caps, and the distinct line of the rainfall, now a mile and now ten miles away. But not until we reached a camping place and erected our tent, did the full fury of the storm break upon us. Looking out from between our canvas walls upon the black water, we felt how frail our little canoes would prove in the angry sea, and how certainly would they have gone to the bottom had we been caught by the gale even a short half mile from shore.

A few miles sail in the narrow lake, following the sound of the falls, which we heard occasionally during the night, we reached the first cataract of Nepigon River about 10 o'clock the next morning. Hurrying over the short portage, with our rods and landing nets, we were soon casting our flies upon the rushing water with a zest as keen as if making the first cast of the season. And we were well rewarded. A sumptuous dinner of broiled trout filled a want long felt. Our success before noon brought us to the adoption of three and a half pounds as a limit of size; below which any caught and uninjured were to be returned to the water. Twice that afternoon my fly was struck by huge fish, which marched off like wild horses regardless of line and rod. From one the hook pulled out, and the other took hook and leader away with him. I dared not give him more line, for some sharp rocks around which they were going would have cut it like a knife.

We changed the limit to four pounds the next morning. I do not recall how many we took in all during the day, but the fishing surpassed anything I had ever seen. F. and I brought into camp, after an absence of only an hour and a half, five, weighing respectively 5½, 4¾, 4½, 4¼, and 3¾ pounds—an average of 4 pounds 7 3-5 ounces each. The smallest fish was the first caught; and, as the weights were taken after getting back to camp, I believe he would have marked four pounds when first killed. These were only a part of what were taken that day.

The next morning I took my rod, and with Wassy as canoe-man, crossed the pool at sunrise. I tried a few long casts without a rise, when I thought I would try a short one nearer the shore. The fly had barely touched the water, not twenty feet from me, when the best fighter (if not the largest trout) I ever hooked, struck in earnest. For a full half hour my muscles as well as my tackle were in a constant strain. Every artifice a trout ever resorted to, he tried upon me. Now a rush out into the deep swift water, carrying out the line until my thumb felt blistered with the friction of the reels; then a sudden turn towards me, leaping from the water with a shake of the head like a terrier with a rat; now a dive to the bottom and sulking, until, with some sharp jerks, I would rouse him into more active hostilities; until at last, everything tried, the little bamboo unshaken, but with the leader half-frayed off, and the feathers of the fly torn to tatters and ruined, the brave fish surrendered, and I more than half-wished he had not been so hooked as to kill him. He deserved his liberty—he weighed four and a half pounds. I need not narrate how we took others; but the sport and the scenery were both unsurpassed in our experience. With the exception of the accidental catch with a metal minnow in Lake Nepigon, we did not in one whole summer take a trout with aught but the fly. I believe, however, we could with bait have taken even larger ones than we did, as is sometimes done on the river, as well as elsewhere. But such taking we had no taste for. It is the sense of skill and the excitement of the cast and rise which is the charm of fly fishing.

With a few observations upon the general character of the lake and river, I will take leave of the reader, if any have thus far followed my story. I should like to tell of the trip down, and of the dignified Chippewa Chief we met one evening sitting in state at the end of a portage, under a birch bark blanket, in the dismal rain, and of other things of which my memory is full, but lack of space forbids.

Nepigon Lake is a great reservoir where the warm red waters of its rivers are settled, and clarified, and cooled. The rivers of Chief's and Gull bay, I am reliably informed, are of the same general character as the many we visited. If such be the case, they cannot be the homes or breeding places of many trout, although it is possible, as I have before intimated, that they may breed in them to some extent when the fall frosts have cooled the streams. But I could not learn, either from Mr. Le Ronde or the Indians, that such is the fact. The Wabenoosh may be a breeding place, but it is not a large river, and any great influx of trout there in the fall would be noticed by the many Indians along its banks. It is the only stream we saw with a temperature low enough to make it a trout stream.

The climate of Nepigon Lake and River is milder than that of the north shore of Lake Superior. For instance, on July 16th, at Big Flat Rock Portage, we found ripe blueberries. On August 8, at Michipicoten River, they were in about the same state. July 31 we gathered the service berry fully ripe, on the upper part of Nepigon River. On August 15th, seven miles from Sault Ste. Marie, none were to be found ripe enough to eat. Potatoes grew finely at Red Rock and Nepigon House, and would anywhere on the river or lake where soil sufficient to support them could be found. Hay is raised also, and oats could be successfully grown. Turnips and radishes also do well, but most other vegetables find the season too short.

C. C. H.

TURKEY HUNTING IN VIRGINIA.

A NEW YORK SCHOOLMASTER IN THE VIRGINIA WOODS.

MY vacation weeks I have been in the habit of spending for the last six years in the "Old Dominion," among friends of a genial and hospitable sort, whose homes and hearts have been singularly thrown open to me. Until the present year I have put in my time in another part of Culpepder County, near the union of Culpepder, Fauquier and Rappahannock, where partridges, woodcock, pheasants, rabbits and wild turkeys have each in their turn afforded blessed opportunities for wide shooting and tall missing. The trouble with me is that I have a splendid breech-loader and a misdirected passion for shooting. This passion is a remnant of my boyhood days, and affords a rare chance for self-delusion as to the "sere and yellow" age which is creeping on apace. It is not a settled fact that middle-aged men never go hunting, but it is true that while hunting no thought of decrepitude or approaching senility ever enters the brain. The fountain of perpetual youth springs ever from the muzzle of a double-barreled shot gun. Let me say, for the benefit of pedagogues and other sedentary souls who have never tried it, that one solid week of gunning in the early part of the "open" fall season is worth any six weeks of summer lolling about the corridors and breathing places of seaside and mountain resorts. Let any doubting soul try it but once, and save me from further digression.

I have just finished my fifth day of turkey hunting in the Virginia woods—glorious days, all of them; in the saddle from eight in the morning until after nightfall, taking out, of course, the blissful hours spent in the "turkey blind," listening to the call of the human "yelper," and the musical return of the real game bird of America—for, say what you will, and cite all the authorities from Nimrod to Bogardus to the contrary, the fact will yet remain, that for genuine health-giving, blood-quickening sport there is nothing known to men, or books to be compared with the coy and fitful "yelp" of a wild turkey that is incautiously marching into the very muzzle of your gun! But don't make a mistake here. They don't all march into the muzzle, nor has a hunter been discovered who was sure of his bird at a distance of twenty paces, though standing still and erect, with a clear unmistakable broadside presented to the hunter's gaze. There is many a slip 'twixt cup and lip, and the difference between a live and dead turkey is not always the pulling of a trigger. But the charm of wild turkey hunting does not lie wholly in the pulling of a trigger. Mr. Glass's famous recipe for cooking rabbits has a peculiar application to this kind of sport; for the turkeys must first be found before they can be shot, and to me the chief sport lies in the finding. I will not attempt to describe the indescribable charm of hunting the game. To understand it at all one must know the surroundings and be in full harmony therewith—must have some aptitude in the art of "roughing it," and have sufficient practice in horseback riding to render a jaunt of fifteen or twenty miles a day, over mountains, through valleys, across streams, with fences to pull down, and thickets to penetrate, a pastime instead of a labor. He must be willing, if needs be, to ride for hours and days with no more success than an occasional "sign" of the migratory flock, a few tracks in the roadways, scratchings in the fallen leaves, with an occasional scenting of the trail by the keen-nosed turkey dog, for you must know that the ordinary bird dog is of no service in this work. A good turkey dog is a rare article; and indispensable in the finding process. Not only must he have a nose for turkeys, but must know how to flush a flock when he finds it, giving prompt notice of the fact.

There are but two dogs that belong to this class within twenty miles of this place, and but two men living in this region of wild turkeys who are known as successful hunters. I have spent the last five days with these men and dogs, the net income of which does not quite average three turkeys a day. My own share in this slaughter can be computed on the fingers of the right hand, leaving three fingers and a thumb for next year's tally. The record of this performance has been duly engraved upon a spent shell, and reads thus :—

> The load from this shell brought down a fine young turkey gobbler in the Virginia woods, near Rapidan Station, Oct. 30th, 1879; and this record was made on the spot. The credit of the performance is due to Jim Lewis, of Mitchell, the prince of yelpers."—*Requiescat in pace.*

To be a good "turkey yelper" is to have a liberal education, and requires an amount of practice and self-denial worthy of even better results. The rarity of this accomplishment renders its possessor a marked man in the country, and opens to him all the avenues of social and political preferment.

I doubt, however, if this is made an especial part of rudimentary education in the schools, and fail to notice the endowment of a chair of turkey yelping in the Washington and Lee College or the Vanderbilt University. It will probably come in as a reconstruction measure. These, however, are only the notions of a school-master, who is not necessarily a statesman or a politician.

After an early start yesterday morning, and a few hours of prospecting in the woods and pineries, our dog Nina struck a trail, and was off in a flush. In a few minutes her note of exultation proclaimed the fact of a flush, and two fine gobblers went sailing over our heads, and were lost to view in the forest leaves. The Doctor, who is the champion turkey wing shot of the country—and who, by the way, was one of the chief spirits of Mosby's clan—drew up his 14-gauge muzzle-loader, but was too late to mark down his bird. Having a record of fourteen bagged turkeys this fall, without a miss shot, he prudently held his load for a surer score. "Brother John" contented himself with observing the plumage and avoirdupois of the receding game, exclaiming in satisfactory tones, "That's a fine flock!" Jim Lewis quietly cast his eye about for an eligible spot to erect a blind, and the Schoolmaster quivered with inward satisfaction. To him, as a chief source of joy, there seemed approaching one more chance to wipe out the disgrace of two consecutive and conspicuous miss shots. For the past twenty-four hours he had been mentally figuring upon this problem: "If an ordinary pedagogue, with a good gun loaded with three drachms of powder and an ounce and an eighth of No. 5 shot, can put forty pellets within an area of ten inches square, at a distance of fifty yards, why may not the same pedagogue hit the broadside of a turkey gobbler with the same gun and load at a distance of twenty-five yards?" He had as yet been unable to arrive at a satisfactory answer; and here seemed coming a practical method of solution. There were three "yelpers" and one professor, and it was decided that there should be constructed three blinds—a yelper to a blind—and that the Professor should go with the one most likely to bring him the first shot. To this post of honor and responsibility Jim Lewis was elected, and we began work at once. "The first thing," says Jim, "is to select a good position for the blind. It must be as near as practicable to the spot where the flock was flushed. It must be made to conform to the general appearance of its surroundings, so as not to seem conspicuous or an unusual feature. It must command the immediate outlying space, so as to get a clear shot at the approaching turkey, at a distance of from twenty to forty yards."

Such a spot was selected, and in a brief space a blind was constructed, mostly of oak and pine saplings, which were easily hewed down with our jack-knives. We got inside the blind, giving room for the dog, whom we covered in part with leaves to conceal the white spots on his body which might possibly be observed through the apertures by the keen-sighted turkey. "Now," said Jim, "I'll give you a point or two, for you are to kill the first turkey that comes in range. Your first danger will be to shoot too soon, as you are likely to be deceived as to distance. To avoid this let us fix the range in our calm moments. There is a pine tree to our left which is about thirty steps distance. If a turkey comes to a clear space this side of that tree you will be almost sure to bag him if you get a good aim and hold your gun steady. There is an oak to our right, at least forty steps away. If the bird comes in that direction and is not likely to come nearer it may be well to blaze away; but if he is coming on towards us, wait till he gets nearer—not near enough to bite us—but near enough to afford of shooting at his head. The fact is, a turkey coming to the blind looks larger and nearer than he really is, and an inexperienced person is very apt to shoot out of range." This explanation would have afforded me great relief for past offences but that I knew that none of my misfortunes came from a too long range. They were inexcusable and inexplicable, if not irretrievable misses. The requisite half hour has elapsed, and the "yelper" begins his work, at first softly and cautiously, with listening ears after each call, then more loudly and clearly, sending out into the reverberating forest the seductive and appealing notes of the genuine wild turkey. A few minutes only elapse before a distant and faint response is heard. The blood leaps to the extremities, and the Professor's heart begins to thump against his ribs like a trip hammer. The breech-loader is brought to the shoulder and its muzzle pointed in the direction of the sound. "Better not shoot yet," says the yelper, "he may come in sight if you can wait a minute or two." "All right," responds the Professor, "I'll wait for orders, only don't prolong the time on my account; I'm ready and cool, and the turkey that comes within my range this day must bite the dust." In less than a minute the answering notes have grown nearer and yet more near, and in the distance appear two beautiful young gobblers, marching breast to breast into the very jaws of destruction. Occasionally they stop for a moment to get the direction of the call, and again resume the walk of death. "There," says the Professor, "they are both together and within easy range; let me shoot, and I'll bag them both." "Better not risk it," whispers the yelper, "they are farther than you think; besides, they are coming nearer every second; no need of risking your fire or throwing it away. Wait till they step upon that log that lies directly in their course and then you can't well miss them." This seemed a reasonable proposition, as it proved a sound one, for in a moment the foremost victim sprung lightly upon the log, stretching up his long neck, and seeming to peer directly into the muzzle of the breech-loader. "Now you may fire," quietly said the yelper, and no sooner said than the death-dealing pellets sped on their fatal mission, and the tall young gobbler lay sprawling upon the ground with two broken legs, a broken wing, and several side issues that bespoke unusual earnestness on part of the Professor. Meantime gobbler No. 2, who was supposed to be under the eye of the yelper, took to his wings, and without molestation sought the securer retreat of the distant pines. "Why didn't you shoot," modestly asked the Professor. "I was waiting to see you miss, expecting to help you out," was the reply. "Thank you," responded the Professor, "I always help myself to turkey when it is thrust under my very nose." And when the dead gobbler was brought into the blind and lay prone as a trophy of undoubted skill, the Professor straightened himself up, and a suffusion of conscious rectitude gave him the self-assertive air of an old turkey hunter.

It is well that this record should here come to an end, as the luck of the hunt seemed to have sped away on the wings of the bird that the yelper neglected to shoot. A second flock, however, was "squandered" at the close of the day, from which the yelper and the Doctor each secured a sample, leaving the rest to be "called up" at day break, of which, if ever an account is given, it must be the subject of another screed.

PEDAGOGUE.

Rapidan, Culpeper Co., Va., Oct. 31st, 1879.

ST. JOHN AND THE UPPER SAGUENAY.

V

IN the latter part of July, 1879, accompanied by a friend, I left Quebec for the Saguenay. Lake St. John, our destination, lies 120 miles nearly due north of Quebec, but the only practicable route is down the St. Lawrence and up the Saguenay river, then by private conveyance to the lake, in all nearly three hundred miles. A railroad out to the lake from Quebec will be completed in two or three years, and a large wheat country be developed.

The monotony of a driving north-easter which faced us all day down the Gulf was relieved at Tadousac by a short visit to the Canadian Fisheries establishment. There were 300 salmon in the pool, many weighing forty or fifty pounds. They were leaping and playing with a magnificent ease and strength, which rendered this, our first view of King Salmo, truly impressive. His Majesty gained at least one admiring subject by showing the gleam of his royal sides that afternoon, and I here declare my allegiance. *Vive le roi!*

The leaden light was deepening as we steamed away

Tadousac and into the great chasm of the Saguenay. Its shrouding the grim walls in a darkness only less gaunding than their own desolate heights. Some time our night we met a cold north-wester, which put the of a to rout, and we woke with a shiver in the early to find the steamer at the wharf and the wind whist- from the hills under a clear sky. A large Yankee was out in the bay loading with lumber for Aus- dia. Ha Ha Bay is sixty or seventy miles up the river, is said to owe its name to the astonishment of the first nch explorers, who, mistaking the splendid bay for the main river, followed it up till brought to a sudden stop, "Ha! Ha!" exclaimed they, and Ha Ha Bay it remains to this day.

One of the numerous cabbies at the landing agreed to carry us to Point Blue, Lac St. John, for six dollars. We selected the fellow because he could speak a little English, vile though it was, but the sinner bundled us into a two seated buckboard and handed the reins to a native, who drove us well out of the village before we found that "tabac" and "dollar" were the only words he knew in any lingo but the choicest Canuck *patois*. But never mind, that fellow for his six dollars drove us and our two hundred pounds of baggage ninety-one miles in less than two days with one horse. He then started back forty-five miles; whether he made the distance I know not, but returning by way of Chicoutuice, where we stopped at Ha Ha Bay, he grinned at us from the dock as though he thought he had made a good thing of it. The native horses are naturally tough, but are much abused and soon wear out and break down. Travelling costs very little after leaving the steamer, the whole expense of our two days drive with lodging and meals for all being but ten dollars. The people complained bitterly of the scarcity of money, though well satisfied with the natural resources of the country. Our little stock of French was taxed to the utmost in making ourselves understood, and then the people understood us better than we could them. They are great talkers, and a direct question from us usually elicited an "oration" in reply. Queer fellows, these *habitans*. Every house is built of square hewed timber with pitched out eaves, and always stands as near the main road as possible. Newspapers are in demand—illustrated ones preferred—for pasting over the logs and cracks inside. Birch bark frequently answers the same use outside. Except the buck-board, every vehicle is a two-wheeler or on runners. The roads are terribly hilly.

The mountains along the north shore of the Gulf form the southern wall of a great plateau, shown in sections by the rifting of the Saguenay chasm, and itself upheaved into mountains one or two thousand feet high. This numerous outcrop of primitive rock dips a little to the northward, and at Ha Ha Bay the mean surface must be several hundred feet lower than near the Gulf. Though the country we traversed is less broken as well as lower, the tale of mighty forces is told on every hand. Throughout the first fifty miles it is granite everywhere. It crops out in little ledges by the roadside, and again in hills hundreds of feet high and with hardly enough soil to allow a few stunted bushes to cling. Not a trace of order appears in the arrangement of the hills and mountains. It seems as though a sea of melted granite had been upheaved by ten thousand tempests and earthquakes at one time and suddenly cooled: level plains, rolling swells of granite, hills in ranges, clusters and single, masses of mountains thousands of feet high were formed over an immense territory, though ages of erasion have polished the granite billows and the detritus is spread through the valleys; it is but a little reach of imagination to picture the first appearance of these features, so terribly alike in all their variety, above the waters of the universal sea.

In a sort of "crack" in the country, and within sight from several points along the road, is Lake Kenogami, twenty-one miles long, yet scarcely a mile wide at any point. Precipitous, rocky mountains rise abruptly from the west shore, broken by deep gorges, from which pour icy trout streams which rise in the wild mountains beyond—and we were told of eleven-pound trout to be caught at that time in deep water. On our return we stopped in the middle of a fiercely hot day at the mouth of the Bois Vest, a trembling torrent a hundred yards wide, and caught a dozen in a few minutes (none over a pound weight), but whose large tails and rather coarse build, like those of the Rangeleys, showed them to belong to a giant race of trout. Fire and the axe have played havoc with most sections where there was soil enough to support a continuous forest or trees of size worth cutting. Along Kenogami, however, the mountains are partially clothed with a dark growth of scrub spruce and fir, but elsewhere, especially further north, the bare rocks and dead stubs give the hills a terribly desolate aspect. Where fire has swept without the axe there are miles and miles of tall bleached trunks standing like quills on the back of a porcupine, and not more pleasing to the eye. The granite finally disappears under the limestone formation, in which lies St. John, yet extending to the very south shore of the lake, forming the hundred little surf-beaten islets about the Grand Discharge.

In the forenoon of the second day, as we slowly gained the top of a hill our eyes became intently fixed on the withered and fire-swept mountains on our left, now gathered into long ranges, extending northwesterly toward Hudson's Bay. Almost unconsciously we became aware, as it seemed, of a great black mountain filling the sky to north and east. With a little start, we turned to look at the same instant. It was the lake. Piled up against the northern sky in the clear air, and wide as the field of vision, its dark blue waters sent through us a thrill, almost of awe, as we gazed. It was a sudden revelation of the possibilities of this land toward the Seven Stars which made the breath come short. "*Beau Lac!*" cried Pierre. "Grand Lake!" we replied. From our two hundred feet elevation the east shore was visible, and beyond the mountains rose in wildest confusion. The horizon was ragged with their angular, forest-covered masses, and it is the wildest looking region I ever saw. Several hours we travelled on up the sparsely settled strip along the west shore of the lake, stopping a few minutes at the lower Hudson's Bay post on the Matabetchman, then on nine miles to the Ouinchouanish before dinner. This latter river leaps the mountain wall there less than a mile from the lake with a sheer fall of between one hundred and two hundred feet, showing the lowest level of the land for a long way west to be considerably above that of the lake. Toward four o'clock the frightful jolt-

ings of the ninety miles were ended, and our Kanuck drove off, with a "*Bon jour!*" leaving us at the upper post on the Point Blue Reservation. Next morning a cold northwester set in, and for two days the white caps drove across the lake, and rolled with a constant roar on the rocky beach. Though wind-bound, we were saved the unpleasantness of camping through the rain on an exposed shore by the kindness of Mr. Spence, the Company's agent, and his wife, and were also assisted by Mr. S. in selecting a canoe.

There were about thirty families of Indians and half-breeds on the reservation, most of whom were building and repairing canoes to go up the rivers and hunt. They spend the spring and early summer at the lake, in their tents and cabins, and hunt during the fall and greater part of the winter on the heads of the rivers, hundreds of miles away. There are no moose or caribou near the lake now, and few skins are brought in. The men were quiet, dark, strongly-built fellows, with quite a sense of humor and a pleasant, almost musical language. A few speak English. One man I quite admired—a very straight, dark, broad-shouldered man of thirty, reputed a good hunter and the best canoe maker. The older squaws were not beautiful, though good to work and paddle. Some of the younger ones were not bad looking, wearing bright colors with good effect. Pappooses, tied up in pieces of bark, abounded, with numerous little sharp-eared dogs said to do great work on beaver when the ice is clear; the wicked flea also was there.

Formerly the Company advanced every hunter several hundred dollars worth of goods yearly, but since the settlers have come in and the company lost its former absolute power, the Indians have become unreliable, and Mr. Spence said the tribe then owed the Post more than $2,000. A good hunter gets as much as $800 worth of fur in one season, including perhaps 100 beaver. These few Indians are the only inhabitants of an immense territory, chiefly about the heads of the great rivers Chouchouan, Mistassini and Peribonka. After considerable bargaining, though done in a few words, we secured a large canoe just finished for $14. The usual price is half that amount, but they were in demand, on account of the hunting season being near. They build beautiful canoes, these Mistassins, of wonderfully good lines, and deep, with sharply up-curved ends to meet the great waves of St. John. For a long time the Indians have made it the point their summer camping place, it being near the mouths of two large rivers. Over eastward across the lake is Peribonka—"River of the Sun." And river of the sun I felt that it was indeed, when, standing as thousands of the ancestors of my dusky canoe-maker had done, I saw the sun rise from the lake and knew, though beyond sight, that the great river was there. The old wild men got nearer the forces and phenomena of nature than we do, and something of their spirit is in the names they left behind.

Intending to take a two or three weeks' trip, we started up the Mistassini when the storm cleared. The river is three miles wide at the mouth, and sixteen miles up the shores are still nearly a mile apart, though it there flows shallow over shifting sand bars. It pours down a large volume of cold water whose reddish color tells of forests and mountains in the interior, yet as far as we could see the same low, sandy wooded shores stretched away northward, except perhaps thirty miles from the lake, where appeared a low mountain or ridge. From this river around to Peribonka is a wide tract of level country, well wooded, and a great place for bears and wild oats. How far this flat country extends toward the interior of Labrador I could not find out. But the Indians said that 150 miles north, where is the great Mistassini Lake, with its 4,000 miles of area, the shores are low and the land level. It is not easy to induce an Indian to say much about his hunting ground, and the few facts we could gather were fairly earned.

Camping early to avoid a shower some twelve miles up the stream we pitched on a wooded sand bar which proved the worst mosquito hole I ever got into. At night they swarmed into the tent—great bony, long billed fellows—by thousands, in spite of the densest of smoke and the thickest of tar and oil. They screamed and whirled about, filling the air and biting until we were nearly frantic. The worst spots in half a dozen summers in the spruce woods were bliss in comparison. Finally, B——, with an idea, seized his blanket and rushed for the canoe. In a couple of minutes we were tied to a stake well out in the river, and lying head to head in the canoe, soon slept comfortably without the "muskeets," and regardless of the danger of a capsize. Toward midnight I woke; we were adrift; the rope had come untied. I do not recollect a more bewildering sensation than that of waking up in the blackness on that great, desolate, unknown river, full of bars and currents.

The sky had clouded over heavily and the low distant shores could hardly be distinguished in the gloom, while low thunder muttered in the oppressive air. I thought of original chaos. As it afterward appeared, we had drifted about a mile, and it was a long time before we found the camp and resumed our floating bed, this time with a better knot.

Awakened again by a pouring rain, we retreated to the tent, rolled the blankets about our heads and slept a little, though nearly stifled, while the enemy with unceasing yells, tried in vain to pierce the covering.

Leaving the place next morning without much regret, we continued up stream a few miles when an intensely hot sun produced symptoms of sunstroke in my friend, already somewhat unstrung by the events of the night, and it became necessary to turn back. I was sorry not to reach the first rapids, three or four miles further on, for the Indians assured us we could get plenty of fish there. The salmon, or winninish, run far up these rivers and weigh, it is said, fifteen pounds. We saw none over six pounds. The Indians fish with gill nets, and besides the winninish, catch white fish, large pike, and a kind of large perch. There are trout in Peribonka.

My companion's attack of sunstroke was fortunately not serious; but not daring to risk a trip into the interior, we took a cruise of sixty miles or so around the west shore of the lake, past the Grand Discharge, and on till the broad mouth of Peribonka lay before us; then retracing part of the way, went up Belle River. St. John is thirty miles in diameter and nearly round, with no islands far enough from shore to break its wide expanse. Yet, strangely enough, it has no depth, being indeed a mere *splash* on the surface of the country. We usually sailed along a mile or two from shore, yet much of the way we could touch bottom with a paddle. Its shallow waters respond to the slightest breeze, rolling up into peculiarly ugly waves, which, the day before we left the lake, gave us a wild tossing, as the canoe leaped from wave to wave. At last we were forced to beach her, and were lucky to have the chance. There are large trout in all the waters south and west of the lake, but one must go a few miles back from the settlements to find good fishing. The few ducks we saw were wild as possible.

It is not far from fifty miles to Chicoutuice by way of Belle River, and the lakes furnished us with trout enough to eat most of the way. Except having the tent whisked off by a little tornado, and being well wet and pelted with large hail one night, we had no mishaps, and made our last camp in the Dominion on Kenogami, and a pleasant one it was. Of the glorious purple lights on the magnificent mountains jutting out in succession, far up the lake, and the rare memories of that evening scene, "I know, but may not tell."

Fair fishing was reported at Chicoutuice, and we saw some beautiful salmon brought in; but our rods remained unstrung, and we left immediately for the States. B—— went home, while I tramped thirty-five miles from the railroad to Chester's Camp, on the Connecticut Lake, and played wild man three weeks more. Doubly delightful seemed the grand forest around the dear old lake, after the desolation of the Saguenay. RANGIFER.

Nov. 8th, 1879.

Natural History.

GEIKIE ON DR. HAYDEN.

IT is gratifying to note that the name of Dr. Hayden is not to be smothered by the mantle of indifference of politicians who have persecuted the United States Geological Survey at Washington. In the majority of the hearts that know him there is a warm spot for Dr. Hayden. He has conducted for the United States Government a geological survey on a more magnificent scale than was even projected by any other government or main.

The name of Archibald Geikie is nearly as familar to the households of America as to those of his native Scotland. His persistent friendship for Dr. Hayden, and his special mention of him in his writings, will strike a responsive chord of the popular heart in this country. In his new work, "Outlines of Field Geology," just published by Macmillan & Co., Prof. Geikie pays very considerable attention to Dr. Hayden at intervals throughout the book. On page 36, in giving directions for the construction of geological maps, the author says:—

"In those parts of the world where no good maps yet exist, geological and togographical surveying are sometimes conjoined. I may cite as admirable illustrations of this union the explorations of the river-courses of Canada by the late Sir William Logan, Director of the Canadian Geological Survey. He and his colleagues had to furnish themselves with canoes, attendant Indians, provisions and hunting gear, and push up unexplored rivers, winding through dense forests of the Province. They explored, mapped, geologized and hunted, laying down lines of traverse, which served as the base for future more detailed topography, and did vast service in opening up the country.

"Still more elaborately topographical are the remarkable surveys at present carried out under Dr. Hayden, geologist in charge of the Geological and Geographical Survey of the Western Territories of the United States. Year by year valuable reports, drawings and photographs by that able geologist and his associates make known the geography, geology, natural history, botany, meteorology, ethnology and antiquities of thousands of square miles of previously unexplored or but partially explored land."

In the above sketch Professor Geikie expresses his high opinion of the Geological Survey. In the following, taken from his explanation of "preliminary traverses," on page 45, he writes of a dear friend:—"Now, with field geology and map making as possible and as actually accomplished in Britain, let us contrast the condition under which work of this kind must be carried on in an unexplored region like the Western Territories of the United States. The survey of vast tracts in those parts of the North American continent has been entrusted to my friend Dr. Hayden, one of the most zealous, active and efficient men who ever undertook of pioneering through a new country." It will be noticed that Prof. Geikie's work deals largely in explanation of methods used by working specialists in all geological work, and though himself the director of the Scottish Geological Survey, he refers to American operations adopted by Dr. Hayden as the best examples to follow, and thus continues:—"But the utmost skill and experience cannot alter the natural features of a country and its climate. The American survey requires to be carried on in a very different manner from ours, and I cite it as an excellent example of how field geology can be prosecuted in new and previously unmapped regions. As the topographical map of the country requires to be made, Dr. Hayden's survey is at once geographical and geological. His staff contains more topographers than geologists. It requires division into separate working parties, to each of which a distinct tract of country is assigned. From the higher hill-tops triangulations are made and outline sketches are taken, so that a general map is traced and filled in. In this work the geologists coöperate, indicating to their associates the salient geological features of each region, and inserting upon sections or diagrams which, for beauty and effectiveness, are among the most remarkable geological sketches which have yet been produced. Besides the scientific staff, however, provision has to be made for a foraging department; and sometimes also an escort is needed, where the work lies in or near the territories of hostile Indians.

"As a sample of equipment of Dr. Hayden's survey, I may cite a few particulars from his report for 1874. The staff in the field were divided into seven parties, and of the organization of these, the first may be taken as a type. It consisted of one assistant-geologist or director, two topographers, two meteorologists, one botanist and collector, one general assistant, two packers, cook, and hunter. It would seem that there was thus only one geologist in the party, though probably one or two of the members were able to lend him some assistance. Starting

on the 20th of July, the party continued the compaign till the 27th of November. During that time it surveyed 4,300 square miles of new ground, which is an average of somewhere about forty square miles a day. This working party therefore, though probably not much more than one geologist strong, accomplished in three days as great an area of work as one of my colleagues finds it possible to accomplish in a year. Such rapid surveying can, of course, be regarded as furnishing merely a kind of rough preliminary sketch of the geology of the territories, to serve as the basis for future detailed surveys. It may be taken as an example of broad generalized field work on the one hand, while the geological survey of Britain stands at the opposite extreme as a model of patient, elaborate detail. Obviously, such detail is, at present, wholly out of the question in such regions as those where Dr. Hayden is at work. He must be content to sketch the main outlines; and the details in which he is fulfilling his task may be usually studied, not only by the beginner in field geology, but by practical surveyors, who will cheerfully recoguize the masterly character of the work which their American brother of the hammer is conducting."

This last sketch was written before the change of directorship in the American survey, and was delivered by Prof. Geikie as a part of a lecture before the University of Edinburgh, though now incorporated in his valuable work.

Quite a number of the illustrations in the work are taken from those in use by the Geological Survey of this country, and the author seems to take especial pains to compliment Dr. Hayden at every place possible. It may be observed in conclusion, that Dr. Hayden is generally regarded in the Old World with more consideration than in the New. Indeed, it really seems as if his name there is regarded as one of the brightest in our scientific firmament. In almost any other country than the United States, one who had served his country so honorably, and had filled his post with such high distinction, would not be so ruthlessly pushed out and forgotten as Dr. Hayden has been, but would be allowed to retain his place until death, as in the case of Sir William Logan, of the Canadian Geological Survey. WM. HOSEA BALLOU.

DO BLACK SNAKES EAT FISH?—*United States Commission Fish and Fisheries, Washington, Dec. 23d, 1879.—Editor Forest and Stream:*—I would like to ask Mr. Wm. Hosea Ballou, the author of the communication on the fish eating characteristics of black snakes, in FOREST AND STREAM for November 27th, 1879, whether he is sure that the species referred to by him is the *Coluber* or *Bascanion constrictor*, or the black snake proper of naturalists. Black varieties of many species of colored snakes are common in the United States, and certain regions are known to abound in these more than others. Preëminent in this respect are the marshes along the south shores of the great lakes, especially on Lake Erie, where, for instance, we have the black massasanga (*Crotalophorus kirtlandi*), the black form of *C. tergeminus*, orprairie rattlesnake, the *Nerodia niger*, a black race of the common water snake (*N. Sipedon*), and (less frequently perhaps,) one or two other kinds. SPENCER F. BAIRD.

Our correspondent, Mr. Wm. A. Mynster, writing from Council Bluffs, Iowa, gives it as his opinion that black snakes do eat fish, but has made no observations which directly support this view. He says, however:—

I know by experience that laying hens thrive on fish for I had 2,500 land-lock salmon consumed in that way, and I presumed by one old hen, as she is the only one I ever caugut at it. When I discovered her she was walking quite leisurely up stream in one of my hatching troughs, pecking away with bare feet in the water, at that. In view of this, why should not the black snake indulge also.

BEAVERS IN THE ISLE OF BUTE.—Our readers will recall the experiment noted by us a year ago, of the Marquis of Bute, who some years since introduced into the Isle of Bute, a colony of beavers. The Isle of Bute, in the Frith of Clyde, Scotland, is a mountainous and rugged land interspersed with undulating hills and pretty lakes. We are pleased to clip from the London *Field* the following news of the success of the Marquis' attempt:—

The lately-attempted re-introduction of the beaver into Scotland by the Marquis of Bute, deserves here a passing notice.

In a solitary pine wood near Rothesay, in the Isle of Bute, a space of ground has been walled in so that the beavers cannot escape, and through this beaver's park runs a mountain stream. Left to themselves, they have quite altered the appearance of this stream, for they have built no fewer than three dams across it; the lowest is the largest and most firmly constructed, as it would seem the beavers were fully aware that it would have to bear the greatest pressure of water. In order to strengthen this dam, these intelligent animals surported the down-stream surface of it with props of strong boughs, as artfully secured as though a human engineer had been at work. Immediately above this the beavers have constructed their hut or home, consisting apparently of a large heap of drift wood; upon examination however, it appears that the sticks have been placed with regularity and order, so that the general appearance of the hut is not unlike that of a bird's nest turned upside down. The beavers have cut down a good many trees in their park, gnawing a wedge-shaped gap into one side of the tree until it totters, and then going round to the other side and gnawing the only portion of wood which prevents it from falling. If the felled log is too heavy for transport, they cut it into pieces, which they roll away separately. Although there have been one or two deaths, it is satisfactory to learn that these beavers have bred in the island since their introduction. When we last heard of them in December, 1877, there were twelve known to be alive. They were reported to be very shy, retireing into their hut or into the water at the least alarm. Besides what vegetable food they pick up, they are fed principally with willow boughs, the bark of which they strip off with the neatness of a basket-maker.

This is not the only experiment, however, which has been made of late years in the reintroduction of beavers in this country. A similar attempt has been made in Suffolk. Some beavers were turned down by Mr. Barnes, of Sotherley Park, Wangford, and, on their dams being destroyed as an eye-sore, they stayed further down the stream which runs through the park. They were there two winters, and bred, having three or four young ones. Two of these which strayed, were killed at Benacre in the spring of 1873, and one was captured. They began to build a lodge in the West Bush against Benacre Broad, did no damage to trees, but destroyed some underwood. This third beaver seems to have been also killed. Two of the three were sent to London to be stuffed for Lady Gooch, and the head-keeper took the skin of the third.

It is interesting to find that, but for the interference of man, beavers would still thrive in our climate, as we learn from geology and history they formerly did.

ALBINO COLAPTES AURATUS.—*Elk Lick, Pa., Dec. 20th 1879.*—A correspondendent in a recent FOREST AND STREAM tells of an albino blackbird. The writer once saw an albino yellow hammer, or flicker, in Western Pennsylvania. It was so exceedingly wild from repeated efforts to shoot it that it finally became impossible to approach it within even long range. An albino blackbird seems a commoner thing than this white flicker. Albino robins are not extremely rare; that is, they are plentier than other ornithological albinos.

HOWARD MILLER.

Fish Culture.

FISH FUNGUS AND ITS REMEDY.

THERE is scarcely any one engaged in fish culture, who has not had to combat with this dreaded disease, both in the nursery and ponds; and perhaps there is no one cause that is more destructive of fishes of all ages than fungus, be it in the artificial reserve or in natural waters. This being the case, we are naturally led to inquire into its cause. The writer's first experience with this disease was in the fall of 1878, since which time he has been investigating its cause and endeavoring to ascertain a remedy; in both of which he has succeeded. It is generally conceded that this disease is caused by a microfungus known as *Saprolignici*. This cryptogamic plant is aquatic, and causes the disease by attracting itself to the fish as a parasite; but there seem to be some diversity of opinion as to whether the disease is contagious and capable of being communicated by the affected fish during life and after death, and on these questions the writer assumes the negative.

It is generally conceded that the fungus first attacks those fish that have in some way been injured, and usually the male. This is because the injury has caused a garden spot, so to speak, conducive to the growth of the fungus spores. The Fungi is a large family, of very voracious habits, some varieties being non-parasitic, others growing only on plants; and others again only on animal life. It matters not how numerous may be the spores, they reproduce only where they have attached themselves to such places as are conducive to their growth. In fact, the more limited the habitat of the species the greater its fecundity. If this disease is not caused by wounds, as above stated, why is it that all fish in streams or ponds are not attacked at or about the same time, when the whole water and even atmosphere are impregnated with the germs of this plant? Can this be explained philosophically in any other way than by concluding that the plant can only grow as a parasite, when it has found a wound or injury upon which to fasten itself? If it be true then, that only those fish are attacked in the first instance that have in some way been wounded or have had a scale removed, notwithstanding the water may be filled with fungus germs, then why should this disease be communicated by affected fish, either living or dead? The writer has made somewhat extended observations of fish affected with fungus, both of the salmonidæ family and of the common fish indigenous to this country. He had some eight hundred natives in a small body of water formed by damming a spring brook, which were kept only for the purpose of studying their habits, mode of living, etc. These fish were all caught from sloughs in this vicinity, and of course were more or less injured by the nets and other implements used in their capture. In a very short time after their being placed in this water it was noticed that they began to be affected with fungus. The first attacked were those that had been most severely injured. The fungus appeared in small spots and finally spread itself over a large portion of the body, enveloping the greater part of the fish, and not infrequently growing into the gill organs. Finally some were attacked that were only very slightly injured. The fish thus diseased were invariably permitted to remain in the water until they died, and then were very frequently permitted to remain for several days, after which they were removed, the fungus partially rubbed off, and the surface of the fish examined under a lens. In no case was a fish found that had not in some way been injured. Some fish were removed from the water while yet alive, the greater portion of the fungus rubbed off, and lunar caustic applied, in which cases they all recovered excepting when the fish had been so completely covered with fungus that it died during the operation. After a time all the fish that had been in any way injured died, with the exception of those cured as above stated, on which all traces of the disease disappeared.

Had this disease been capable of communication excepting in cases of wounds and injuries, in the opinion of the writer all the fish confined in this place must have been attacked by it.

The writer has something like forty-five thousand *Salmo quinnat*. These have been on various occasions attacked by fungus the same as were the natives, in which instances it has been wholly confined to a few that had in some way become severely injured, and after their death all traces of the disease disappeared.

But by far the most fatal form of fungus that the writer has encountered has been where the disease was confined to the gills. My personal observation is, that this disease makes its appearance in the fall of the year in those salmon that have attained sufficient age to mit (as to spawners I cannot say, as I have not had any). My fish have had this disease for the last two seasons. On the first occasion I found that my fish began dying, but I did not know the cause; and in every instance go removing the dead fish they were found to contain very very large amount of mit. In many instances the would flow from quite a small fish nearly a wine gl full. This continued for some time, until finally t cause of death was discovered, and the remedy used th will be hereafter referred to. On examining these fi closely the gills were found to be completely filled with fungus to such a degree as to stop respiration and thu cause death. On both of the occasions mentioned, by the making a close observation of the fish as they swam in the ponds one could discover thousands thus affected. They could be discovered by the operculum presenting a swollen appearance. The fish thus affected on both occasions proved to be male fish and filled with milt. On no occasion was a female found with this disease, and in every instance was the disease confined to the gills. Now why was this, if fungus can be communicated by a diseased fish? But it may be asked, if the theory advanced by this article is true, how came these male fish to have fungus? The answer is, that the abdominal cavity being suffused by the milt, it caused the gills to be crowded against the processes on the branchial arch, thus puncturing the gills and thereby rendering them susceptible to fungus. In order that fungus may come it is not necessary that wounds should be large or severe, although it will undoubtedly first make its appearance where the wounds are most severe. This will probably account for the fact that in rivers and natural streams the male salmon are first attacked by fungus, and where the females are also attacked it may be caused by slight wounds, scarcely perceptible to the naked eye, or to punctures on the gill caused by the suffusion of the abdomen, as before explained. But, it may be asked, why are young fry attacked by this disease? The answer is, that their gills are not perfectly formed, and being delicate organs are easily irritated and injured by the minute foreign substances found in all water.

In conclusion, the writer will say, that he will warrant the treatment mentioned in his paper delivered before the Central Fish Association, held at Chicago, to cure any case of fungus within forty-eight hours after treatment. The remedy is salicylic acid and soda borax, equal parts; mix these two powders well together, as the former unmixed is not soluble in water; then dissolve in a little water, after which add more; with this medicate your water until it is barely brackish. Since the date of that meeting, he has had occasion during the past fall to use the treatment, and the use was attended by the very best results. The only thing that will now be added to the treatment is, that after using the same as directed, use salt copiously: this will heal all wounds. The healing properties of salt is probably the reason why fish in salt water are not afflicted with fungus.

Council Bluffs, Iowa. W. A. MYNSTER.

We need scarcely call attention to the foregoing plain and intelligent account of the author's personal observations, as a model way of discussing such vexed questions as that of fish fungus. It is the report of what a man has really seen with his own eyes, heard with his own ears or felt with his own hands, that tells in science. We should be pleased to have such straightforward, practical papers from other fish culturists upon this or other topics.

THE USE OF TAR.—*Rochester. Dec. 26th, 1879.*—I see there is quite a discussion going on through the papers as to who first used gas tar on fish-hatching works. I used it in the year 1854 on my screens in my ponds. Then I put it on hot. I used it on the outside and on the sieving of my shad-hatching boxes, in the year 1868. I thinned the tar by using one-third turpentine, and put it on with a brush. I have used it ever since in all my hatching works. SETH GREEN.

LAND-LOCKED SALMON FOR NEW YORK.—Mr. Eugene G. Blackford, of the State Fish Commission, will have during the latter part of this week at Fulton Market, this city, 10,000 eggs of the land-locked salmon for distribution in the State of New York.

Sea and River Fishing.

FISH IN SEASON IN JANUARY.

SOUTHERN WATERS.

FISHING RESORTS.—*Attention is invited to the notice at the head of Game Bag and Gun columns.*

FISH IN MARKET—RETAIL PRICES.—Bass, 25c.; smelts, large, 15c.; smelts, green, 15c.; bluefish, 15c.; salmon, frozen, 30c.; mackerel, large, 25c.; shad, Southern, each $1; green turtle, 15c.; terrapin, $20 per dozen; frost fish, 6c.; halibut, 18c.; haddock, 8c.; codfish, heads off, 8c.; heads on, 6c.; blackfish, large, 12½c.; flounders, large, 15c.; sea bass, 18c.; eels, large, dressed, 18c.; lobsters, live, 10c.; boiled, 12c.; scollops, per gallon, $1.50; soft clams, per 100, 30c.; large, 60c.; whitefish, 18c.; pickerel, 18c.; salmon trout, 18c.; black bass, 18c.; hard crabs, per dozen, 36c.; soft crabs, per dozen, $1.50; red snappers, 15c.

Fish are in plentiful supply, especially smelts, cod and red snappers.

A LARGE SCORE.—T. J. Valkenburgh, a well known sportsman of Fulton, Oswego County, N. Y. has kept a careful score of his work for the last season, and the result shows that New York anglers need not go out of their own State, to find plenty of reward for their labor. The record is as follows:—I have fished in the Oswego river, not passing outside of the corporation of Fulton, at fly fishing alone, four hours per day of twelve hours each, from May 20th to Oct. 22, at odd intervals as I have found time. Have been out 45 different days, or 180 hours, or 15 actual days' work. Have kept correct record

time, place, quantity and different kinds of fish caught. During that time I have taken 593 black bass; 105 rock fish; 30 pike and 42 chub, making a total of 770 fish caught, an average of 5¼ fish per day. Have also caught during this time catfish, suckers, pickerel and other kinds of fish by trolling and still fishing and by spearing enough to run this number up among the thousands.

ARKANSAS—*Jacksonport, Dec. 27th.*—The dry weather which brought White River to its lowest known stage and dried up many lakes, of course nearly ruined our fall fishing. In a few lakes, fed by springs, good sport has been enjoyed with the black bass, speckled perch (croppie), and pickerel. As the water is now high and muddy, the jack salmon (*Stizostedian americana*), which here takes the bait only in cold weather, will probably escape the usual draft made upon him by our local Waltonians. The shad fry, placed in our river by the United States Fish Commission some years ago, have not yet been heard from.

SAMMON ROE.

FISH SWALLOWING FISH.

There are better fish in the ink bottle than were ever caught out of it.—OLD PROVERB ADAPTED.

That a fish diet is productive of brains has hitherto been a theory. It is now a demonstrated fact. Anglers as a matter of course eat the fish they catch; and anglers, the intelligent reader of this journal has already observed, are a class of men who wear very large hats. We lost sight of this important fact when we inaugurated the "Fish Swallowing Fish" competition. We made our conditions entirely too broad, and as a consequence we have been quite overwhelmed with the ready responses. The time allowed for mailing the stories expired January 1st, but the manuscripts already on hand before that date were so voluminous and have been so generously supplemented by others received since, that we find it impossible to put into effect our original intention of publishing the last installment to-day. The end is not yet. Next week we shall conclude them, for we have a rich store of other matter which is awaiting its turn in this department.

The letters come from all points of the compass and from all sorts of people. Here is an ingenuous story from a little fellow which we publish just as it comes to us:—

RIVERDALE, N. Y., *Dec. 16th, 1879.*

dear Mr. editer:

Bruther reeds yure paper sumtimes, and wun day told me their was a prise of a big fish hook for a story about a fish swallerin another fish, so ide rite and tell you wat i saw last summer in the mountanes whure their w was a Pond. i had sum tin fishes wot you swim in a basin for my burthda with little magnuts in thare mouths, and won da I was in a bote on the pond and thot ide swim them in the water but prety sune a big fish jumped and swallowed won rite down i dont think it tasted very good do you.

WILLIE JAMES.

ONEIDA, N. Y., *Dec. 27th, 1879.*

Editor Forest and Stream:—

My friend Newhouse has a story which he is in doubt whether to call a fish story, or a dog story. He owns a splendid woodcock dog. While hunting one day near a stream, the dog suddenly made a point from the bank directly into the stream. My friend saw nothing but a large pickerel swimming leisurely away from the shore. He shot it, and the dog instantly plunged in and retrieved it, when on opening the fish a fine woodcock was found inside.

D. E. S.

PLEASANT PLAINS, N. Y., *Dec. 20th, 1879.*

Editor Forest and Stream:—

While fishing through the ice for pickerel, this morning, in Long Pond, the rag was swiftly jerked off the bush. On pulling up, found the minnow had swallowed a five-pound pickerel, which contained the last number of FOREST AND STREAM with the leaf turned down at "Fish Swallowing Fish." CAPT. CLAYTON.

INDIANAPOLIS, Ind., *Dec. 24th, 1879.*

Editor Forest and Stream:—

You say you are waiting to hear from a man in Indianapolis before you award the big fish-hook. I wonder if you mean me. I don't know much about fish swallowing other fish. Last summer while fishing in Pearl Lake, fifteen miles from St. Cloud, I caught a pickerel which had two inches of a snake's tail sticking out of its mouth. The entire snake measured seventeen inches. Last October, while fishing in Spring Lake, twelve miles south of Pekin, I noticed that the willow trees along the bank were girdled about three feet above the water. Captain Warren O'Haven told me it was done by the pickerel. If anybody else than O'Haven had told me I should have hesitated about repeating the story.

G. C. H.

CAZENOVIA, N. Y., *Dec. 27th, 1879.*

Editor Forest and Stream:—

About two years ago I was fishing off the wharf at St. Augustine, Fla., with a line upon which were several hooks baited with pieces of liver. Thinking I had a bite I hauled in rather suddenly, when I discovered upon one of the hooks the entire eye of some luckless fish who had got in the way of the ascending hook. Not taking the trouble to remove the eye I cast my line again, when in a short time I caught upon the selfsame hook, the identical fish which had lost the eye. This I know to be a fact, by fitting the eye in the lately lacerated socket. Here you see was a fish trying to eat his own eye. Next.

S. DORIN.

CLEVELAND, O., *Dec. 10th, 1879.*

Editor Forest and Stream:—

I feel it a duty to put on record the following facts:

In September, 1849, while the Lake Superior propeller, on which I was returning from a trip to Marquette, stopped an hour or two at Mackinac Island, I stretched my limbs by strolling down on the gravelly beach, when just at that time, a set-line fisherman came in with a boat load of "Mackinaw" trout. I had no sooner jumped aboard his boat than he looked at me enquiringly and said: "Be you a doctor?" No! Why do you ask? I said. "'Cause I want some naturulfoolest to 'vestigate and explain this 'ere cu'rosity."

I tried to put on the look and air of a naturalist, and he immediately took from under some old sails what appeared to be a huge monster—a real double fish.

"Thar that busts me. How's that 'are?"

I investigated with this result. On the reefs he had set lines strung with hooks about two or three feet apart, baited with herring weighing from six to eight ounces. A trout weighing just eleven pounds had swallowed a herring bait and hook, another trout weighing just forty-five pounds and one half, had swallowed the eleven pound trout, so that nothing but its head was visible, and a spotted pike had swallowed the tail part of the forty-five and a half pound trout to the back fin, which weighed just sixteen pounds, and they were all three alive when the fisherman took them into his boat,

X.

ANNAPOLIS, Md., *Dec. 29th, 1879.*

Editor Forest and Stream:—

I furnish you the following facts, seen by myself and two well-known gentlemen of this vicinity while fishing in and above Severn River, last summer: While one of our party, Dr. H., was sculling the boat in Brewer's Creek, Dr. W. C. and myself were trolling for rock fish—time, 6:40 A.M.—Dr. C. being well up in the bow of the boat, threw his line ahead on the starboard bow, and it barely struck the water before it was dragged beneath the surface and his utmost strength was exerted to draw above water his line, without breaking his rod, but without success. Dr. H. and myself immediately "staked down" and went to the assistance of Dr. C., who by this time was in a fearful state of excitement, not knowing what he had struck, but certain that he had a whopper, as he expressed himself. We attempted to haul in the line overhand, but did not succeed. We could see innumerable flashes of light beneath the water, and finally Dr. H. divested himself of his clothing and quietly dropped over on the port-quarter, determined to see what held the line of Dr. C. When he returned to the surface he begged us to join him in the water and see for ourselves an astonishing sight. We entered the water and we actually saw a rock with the hook in his mouth diving over and under a sunken log, several times, repeating the operation, while two companions held the line beyond the log, in their mouths, while the captive was exerting himself to become free, and which he accomplished while we were watching him. The line was finally detached from the log by Dr. H., in whose possession it now is, and can be seen by any one desiring proof of this occurrence.

G. ASCUTAS.

Drop that line down this way. Indeed we regret now that we have not required all such tangible evidences of the truth of these narratives to be forwarded to us. But what a *bizarre* collection they would make.

NEW HAMPTON, *Dec, 27th, 1879.*

Editor Forest and Stream:—

In the month of April, 1875, my little brother, with a couple of other boys, was sailing a toy yacht on the mill pond near where we then lived. The yacht was secured by a cotton string, and the boys would let it sail out, and when out would haul it back at pleasure. The string had been broken in two or three places and the ends where the knots were tied had become frayed. After the boys had played some little time the sails of the yacht got wet and it could not sail so well. Impatiently trying it several times, the one holding the string began to haul it quickly in, which made the knot "bob" on the water, when a brook trout darted for one of the knots and whirling just as he caught it in his teeth wound it around his gills several times securely binding himself. On landing him he proved to be wound up so tightly that he was nearly dead. He weighed nearly half a pound.

C. E. D.

This contest is assuming an international character. Several foreign countries are yet to be heard from, but we believe no nation is so rash as to compete with America in manufacturing narratives of large size. We are generally conceded to be ahead in "big" things. "Caput Viæ" sends an amusing accunt of fishing for whales with a big rubber man for bait, and after angling unsuccessfuly for a long time, finally luring the monsters by tying a white choker about the neck of the rubber man bait. The following is from the same pen:—

NEW YORK, *Dec. 24th, 1879.*

Editor Forest and Stream:

Without the least expectation of winning the prize I beg to say that there is in Havana a man by the name of Jimenez, who, as a part of his business, makes war upon the sharks that infest the coast of Cuba. He gets from the government a specified sum of money for each shark he kills, and makes oil out of their liver, which, I am told, he sells to druggists.

One night on visiting his line from shore, he found it greatly agitated; there was a terrible commotion at the other end of it, and seeing that everything was safe, he left for home. Early the next morning he found things quieter than at his previous visit, and went to work to haul in his catch. It was a fellow over ten feet in length, and on the line, in front of its nose, was the head of another shark. This was the way it happened: A shark had swallowed the hook and struggled to get loose. The other sharks by it tried vivisection on the prisoner, and as it objected to their familiarity, it caused the commotion above mentioned. The one caught had not been careful where it used its knife, and came upon the hook.

The sea-baths at Havana are large squares cut in the lime stone lining the shore, and in one of these the fish was placed. I saw it floating on its back more than half dead, and it had thrown up a piece of liver belonging to the first shark.

CAPUT VIÆ.

INDIANAPOLIS, Ind., *Dec. 21st, 1879.*

Editor Forest and Stream:—

The black bass has afforded me more sport than any other variety of the finny tribe, and of all the localities I have ever tried, San Antonio, Texas, takes the lead. Some ten years ago I was fishing in Whiteley's Hole, on the Leona, about ten miles from San Antonio, and had great sport until my attendant lost the minnow bucket. I had "been there before," and was not much worried, but told the darkey to bring me a grasshopper, which I put on to the hook, and dropped in near the shore. It had hardly struck the water when it was taken by a small roach; a goggle-eye took the roach, which, in turn, was taken by a black bass large enough to make some play before landing. I was reeling him in when a blue catfish took the bass. Then there was fun. After playing the catfish for a few minutes, somewhat exhausted, he made directly for a huge boulder in the centre of the pool, and just as he reached the sheltered spot was captured by a Texas mud-cat. Such a time! A hundred yards of line was nowhere. Up and down the bank of that pool I went, following the movements of that cat. I didn't care for the fish, but the line was nearly all out, and I could not get another silk line in that part of the country, so I did my level best. I worked with that brute of a mud-cat from 11½ o'clock A. M. until 2½ P. M., when he began to weaken, and show himself on top of the water. I began to feel happy. To add to my pleasure, the fish gradually approached the shore. Those fish were mine; I knew it; but to make assurance doubly sure, I called on the darkey for the carbine (always went "heeled" when fishing in Texas—everybody does, or did then). I intended to shoot that mud-cat; laid the rod upon the bank, reel open and free to run, and took the carbine in hand. Just then an alligator took the fish. I shot the alligator; and the darkey, with the help of a couple of Mexicans, who were passing by, got them all out of the water. The alligator measured seven and a half feet in length; the mud-cat weighed forty-five pounds and seven ounces; the blue-cat twelve and a quarter pounds; the black bass three pounds and five ounces; the goggle-eye one quarter of a pound; and the roach one ounce and a quarter. The grasshopper was mashed. I got them all.

GRINGO.

NASHUA, N. H., *Dec. 20th, 1879.*

Editor Forest and Stream:—

Eagle Lake is a beautiful sheet of water in the central part of the State; it derives its name from the fact that every season large numbers of the white-headed eagle's nest in the tall dead trees which line its shores, attracted no doubt by the fish with which the waters of the lake are well-stocked. It abounds in pickerel; and I usually find time to spend every summer in fishing for them, and right good sport I find it. In the summer of 1876 I was camped on the shore of this lake, where I had enjoyed a week of excellent sport. Toward sunset I thought I would try them just once more for the last time. I used a Buel spoon which had been broken, and which I had repaired myself in rather a bungling but original manner. I made a cast, struck a large fish, and was reeling him in, when, to my astonishment, down swooped one of those large white-headed eagles, and in a jiffy was off with my fish, spoon, and ten or a dozen feet of my line. When my wonder had abated, I rowed back to camp hoping that the thieving rascal had got something now that would stick in his crop.

Now for the sequel. Two years afterwards, in the summer of 1878, I was camped on the shores of Boghus Lake, Oxford County Maine. It is a small body of water surrounded by rugged hills and hidden by a dense growth of spruce. It was full of trout, and such trout—they were very, very large. My guide was confident that no white man but himself had ever visited the lake, and had kept all knowledge of its discovery a secret for the benefit of his patrons. I was the first man that he had taken to it. Opposite our camp, on the other side of the lake, was a cove in which we noticed some of the largest bull-frogs we had ever seen—larger even than those of Umbagog, which are enormous. One morning Eli, the guide, was down by the shore of the lake, dressing some fish for breakfast, when a most unearthly sound greeted my ears Thinking that perhaps Eli had been attacked by some wild beast, I rushed to his assistance. Half way to the water I met him in a state of great excitement. To my enquiry, "What's up?" he replied that a bull moose was chasing a bald-headed eagle across the lake. Wishing to see so unusual a race I went down to the landing, and there, sure enough, was a large eagle closely pursued by a strange looking creature, which was only a few feet behind it, and which was emitting the most doleful sounds as it pursued the unfortunate bird. Suddenly the sounds ceased, and the pursuer sunk out of sight. The eagle hovered over the spot a few moments, then slowly settled to the surface. We jumped into our canoe and paddled to the spot where we had last seen the eagle. To our surprise nothing was to be seen but a bunch of white feathers, which I proceeded to pick up, when I found that I had hold of the head of a white-headed eagle. He struggled fiercely; and it was only by the united effort of Eli and myself that we lifted him into the boat; but, good heavens! what had we got? It had the head and wings of a bird, and the body and tail of a fish. We put for the shore with our queer fish or bird, and upon closer inspection found our monster to be a white-headed eagle partially swallowed by an immense trout. The trout was very, very large, and had gorged the eagle up to the wings, which prevented the eagle from totally disappearing down his gullet. The feathers of the eagle had covered the head of the trout so, at first we could not tell where the trout began, or the bird left off. In a few moments we had freed the eagle from the jaws of the trout, when we noticed a cord attached to the eagle's foot, and still connecting the fated bird to the father of all trout. We cut open the trout, and in its capacious maw we found an enormous bull-frog securely hooked through the back by my long lost Buel spoon-hook, which I recognized by the peculiar manner in which it had been repaired. I am inclined to think that, after the eagle had stolen my fish at Eagle Lake, the line had got knotted about his leg, that feeling like the fox that had lost his tail, and could not make it the fashion for foxes to have their tails cut off, he had sought this secluded spot to pass in solitude his miserable days. Sailing over Bull-Frog Cove the hook had caught in the back of a mighty bull-frog, which was ruthlessly dragged along by the eagle in its flight despite its doleful croaks, making a capital bait for the trout, and appearing to us to be chasing the bird, instead of being dragged along after it. But this is only conjecture. Talking over the events of the day by our camp fire, Eli remarked, "Truly truth is a stranger to fiction."

The Kennel.

BREAKING DOGS WITH COLD LEAD.

FROM the following queries of subscribers we would imagine that, to make certain dogs perfectly controllable, the finishing touches can only be put on by sprinkling the animals, at certain and uncertain ranges, with the various sizes of small shot. Here is what they say:—

I have a fine pointer with a good nose, perfectly staunch. His only fault is that he is very fast, and I cannot keep him near me Will shooting do him good?

My setter works well on quail this season, but when she sees a rabbit, off she goes. I have tried whipping her, but cannot cure her of the habit. Would you advise me to shoot her? Will that stop her?

No, we cannot advise you to run the risk of maiming your dogs, because they have not been properly handled in the first place. In a long and varied experience we, of course, recall a number of instances where more or less cruelty has been exhibited by the owners and breakers of high-spirited, as well as unruly dogs. Both in cold blood, with a view to correcting their faults, and in anger, have we seen dogs shot at; and never with the same result.

Supposing that the temperament of every dog was alike, the attempt to sting, and not injure in the shooting, is a very uncertain operation. How often have dogs

racing wide of the guns turned their heads at the moment the triggers were drawn, and received the rattling charges in their faces. One of the finest field dogs we ever saw was blinded in this way. The poor, intelligent brute looked for his master's signal, only to receive the lead which ruined him forever as a field companion. And so it turned out—as if anything could make matters worse—that the dog had never heard the calling whistle, his master being away to leeward, and the high wind and splashing water had carried the sound away. Then came the dog groping his way along, with a whimpering moan, which seemed to say: "Why did you ever fill my heart so full, and then come in like Death, and tear away the objects of my love? How blind I am! How helpless and alone!"

Dogs, however, are vastly different in their temperament, and the shooting process is by no means a cure all. Where it will check some wildly ranging dogs and teach them a lesson for days and weeks to come, it will terrify and bewilder others, who will drag themselves in to heel, refusing to venture forth again. Then there are runaways who will leave for the uttermost parts of the earth the instant the charge patters on their flanks, and are gun-shy for all time to come. And again there are dogs who seem not to mind the broadsides poured into them, and continue in their wild running. An illustration of the latter trait we once saw while woodcock shooting with a party of friends, one of whom was the owner of a Southern bred pointer. The dog was what is called a "natural dog," that is, he was not trained in the least, but he possessed the faculty of being alternately staunch and unsteady. Master Sport's first performance was to leave us on the edge of the swamp and absent himself for over an hour, when he returned with a somewhat festive twinkle in his eye. He had evidently been pointing and flushing the birds, much to his own delight. After Sport had been remonstrated with through the medium of two dog whips and a remnant of an old foot log, the party proceeded on their way, perhaps a little depressed in spirits. Soon the prodigal winded a bird—which he then deliberately flushed. Three barrels were launched at the dog before the race had fairly commenced. The smoke cleared away; the woodcock was somewhat ahead and "Sporty" a good second. Up the narrow swale they went, turned, and then came down again. During their absence it had been agreed that as one of the party was the best shot the honor of the shooting devolved upon him. As the dog swept past, not over thirty-five yards away, a chorus of "come in Sport" and two more charges were sent after him. Little did he heed, but on he went. Why he was not killed is a mystery. He chased the bird until he lost it and then returned, wagging his tail and licking the blood which was pouring like a shower bath from his well riddled sides. The dog was never shot at again, but was left to chase his birds evermore in peace.

With the knowledge of these facts before us, we cannot consistently advise our enquirers to shoot at their dogs. Even supposing that they could be insured to escape all serious injury, as Sport did, we consider it to be the wrong means to bring about the desired result. Good, judicious training, assisted by the use of checkcords of various lengths, with collar and whip, will in time remedy these faults if anything will. Again, supposing that the shooting was a sure cure, many dogs would in one season be crippled and maimed forever. We warn all of the craft from this cruelty for all time to come.

NORTH CAROLINA FOX HUNTING.

Friday, Sept. 26th, closed our red fox sport of the week. On that morning Brodnax proposed that I should accompany him part of the way home, moving up the Roanoke as far as Robinson's Ferry, twelve miles, in search of other reds. At early dawn we were in the saddle and equipped for the move. Our packs were in full life. We kept the Eaton Ferry road some two miles above my residence, to a field well known as the "scratch field." This name was acquired from an incident in my red fox hunting, worthy of note. Many years since I invited Brodnax, Wm. S. King, Col. Edmonds, Col. S. B. Tucker and John B. Putney to visit me and bring their respective packs to run a famed red fox, famed for his speed, bottom and color. As on such occasions, we had a proper arrangement of everything, and quite early moved up the Roanoke and soon had the red on his feet, and nimbly did he use them. His usual run was from my house to Robinson's Ferry, twelve miles, and thence back to Gaston, eighteen miles. This run was made twice with marked spirit by huntsmen and hounds. But on his third run down Mr. Putney stopped at the corner of this field, and while there, and before he could hear a single note of the pack on their return from below, the red passed entirely through it, stopped a moment, scratched up the earth, and then moved leisurely on. When we got to this point Mr. Putney told us the circumstance, and it being near night we gave up the run, terribly weary and with no spirit to talk over the incidents of the day. Two of the party have passed away since then, and Col. Ned Edmonds and John B. Putney, noble huntsmen, are now at all our meetings of this character favorably mentioned and thought of.

When Brodnax and myself arrived at this field, allusion was made to the past and the incidents of that day gone over. We passed through the scratch field without striking a trail. Our dogs were all full of spirit and hunted wide. Before getting through the enclosure the whole pack broke out in full cry, indicative of a sight race, doubling the game once or twice in the woods. We both stood motionless, undecided as to the game. Nor were we relieved by the thundering cry. The crossing of the track by my Monitor, who runs only a fox, set us at ease. But the pack had then moved up the Roanoke, and with such speed that we could not hear them. I, however, dashed forward to Mount Misery, and on the ridge road opposite the Collar Bone met most of the hounds returning. I heard the horn of a deer hunter, and supposing his dogs had produced the confusion, I blew and made a rapid circle, arousing all the dogs. When Brodnax came up he stated that one of his dogs came to him with a piece of bark around his neck which he had put in his pocket without examining particularly. He then did so, and found a part of the fox's brush tied to it. We soon searched up the huntsman and got the fox.

Gaston, N. C., Dec., 1879. T. G. T.

OUR LONDON LETTER.

Editor Forest and Stream:—

In my last letter to you I ventured on a few remarks on the subject of mange. At the time I wrote them, I thought to myself, "perhaps my Yankee friends may take umbrage at my presuming to play the 'mentor.'" They have not, however, so that in my future letters, I shall not hesitate to now and then give a hint or two on kennel management as conducted here in Merrie England. I always read your broad sheet almost from beginning to end, especially, and with pleasure, your fishing and shooting yarns, and I often get an idea that sets me a thinking from your correspondence columns. America must be a grand country for sport in a broad way. Here, when you go out, you are never sure of a good bag, and often you don't get a nibble you could swear by. Up north, in my own country it is different. If you can make a cast at all, or have ever learned to swing a flail without caving in the stern posts of your skull, you are always sure of a decent basket of trout, or a bonnie fat salmon, and maybe two if you have luck. There is no camp life, however, unless you choose to make camp life of it; and none of that wild adventure which gives, in my opinion, such a charm to rural sport in America. In Scotland when your day's work is over, hungry but happy you take up your rod and toddle back to your hotel, generally a building of palatial appearance, even though there be not a house bigger than a shanty within miles of it, and as a rule the wilder the scenery—and I've no need to tell your readers how grandly beautiful is the scenery of the Scottish Highlands—the wilder the scenery, I say, the better is the hotel. You wash your hands and change your socks, and after just a wee drop of mountain dew—the wine of those regions—you sit down to a dinner, the very sight of which makes your face sunny with smiles. There is many a bosky glen in Scotland, their braes green fringed with waving birch, or tasseled with yellow broom and fragrant furze, with streamlets wimpling through them, that the Yankee visitor to these islands might do worse than spend a week at, unless, indeed he objects to the carol of laverack high in the air, the song of the lintie in the whins, peace and quiet all day, mountain trout for dinner, an honest landlady and a bonnie lass to wait upon him. If he does not object to any or all of of these things, he can drop me a note before he leaves the almighty Republic. I'll be happy to give him addresses.

It is thawing here to-day, sir; that is more than it has been doing for many a day. We have had an early and rigorous winter. Happily, I, for one, was not unprepared for it, for, with the recollection of the specimen of summer you sent us, I had no hopes of much mercy for the winter months.

> "When biting Boreas fell and doure,
> Sharp shivers thro' the leafless bower,
> When Phœbus gies a short-lived glow'r,
> Far south the lift;
> Dim dark'ning through the flaky shower,
> Or whirling drift."

No; and I had plenty of straw, and soft meadow hay in the loft. We in this country find wheaten straw best in summer, and oaten in winter, the latter being softer and looser, and therefore warmer. But during the extreme frost, washing down the kennel decks would have been highly dangerous. All mess was constantly removed; dry earth, sawdust, and disinfectants freely used, and oceans of bedding supplied. The animals had plenty of exercise; somewhat more food than usual, with supper at six for big dogs; puppies, a little milk or broth about 10 o'clock. Treated thus, they have been as happy as kings, and never once barked at night.

A controversy has been going on in some of the sporting papers, regarding the best and cheapest biscuit for dogs. Rev. Mr. McDonna tried to introduce some German stuff, which, cheap as it is, I am told will not keep long. The gentleman's intentions were no doubt good; but we Englishmen are like cows, we like to smell a thing before we swallow it, whether it be statement of fact, or a dog biscuit. And we've been so long used to good old Spratt, that we wouldn't throw them aside for the world. The Germans offered us kings; we took them because the Stuarts turned out a bad lot. When Spratt's patent turn out a bad lot of biscuit, then we'll cut them, and order our cakes from the Faderland—but I guess not before.

There has been the usual amount of growling this year after the "great" Birmingham show. In my opinion, however, there was less cause. The judging, on the whole, was good, with the ordinary slips and overlaps, of course. The committee are learning civility to the press. The dogs, however, are still far too crowded. At Brighton I entered the dog show as the representative of a foreign press, although doing work for an English journal. I entered as your reporter, and received civility and a ticket to spare. At Birmingham I did not dare for fear of the refusal of a free pass. The amount of hospitality shown to a stranger in England decreases as you retire inland, till about Nottingham and the regions round about, they, instead of bread, give you a stone. "Be he a stranger, 'Arry?" Bill will remark—"Aye, Bill, he be." 'Arry will reply, "'Eave 'arf a brick at his b——y 'ead then." This is not new, but it is true.

Your railway companies, I find, are not a whit more kind or obliging to canine passengers than ours are. What does all this red tape about consuls' certificates mean? I'll never forget the first time I visited your consul here. I was told I must have three invoices, and make a declaration. I declare solemnly at that time I didn't know what the dickens an invoice was, and a professional friend whom I consulted was just as g[illegible] Finally my family grocer solved the mystery. It [illegible] bill of lading, after all. I sent out the other day a [illegible] English mastiff. I am told he created no small sensat[illegible] at New York. He struggled through the customs, and [illegible] now creating a sensation at Montana, but his little bill[illegible] the companies for his passage between New York a[illegible] that territory was one hundred and fifty dollars!

The Scotch collie bitch Lassie, which I exported, I a[illegible] glad to see took first at St. Louis. I bred her. She is out of the celebrated Trio, and has the best blood of this country in her veins. This is a dull time here in the canine world. My next letter I hope will be more interesting. A happy new year to you and your readers.

GORDON STABLES, M.D., R.N.

SQUIRREL DOG.—*Memphis, Tenn., Dec. 23rd*, 1879.—In hunting the wily fox squirrel in the thick bottoms of this country a dog is of great assistance in squirrel shooting. He finds them in the woods, drives them into the briers and catches them when wounded. The best dog I ever had for this purpose was a large sized Scotch terrier. A cross between terrier and hound will make excellent dogs for this sport, also for coons, possums and rabbits.

J. G. B.

EASTERN FIELD TRIALS CLUB.—A meeting of the Eastern Field Trials Club was held in this city last Tuesday, at which the discussion of the protests in the last field trials were discussed. Dr. Fleet Spier, of Brooklyn, the owner of St. Elmo and Romeo, claimed second prize in brace stakes. Dr. William Jarvis, of Claremont, N. H., claimed first prize in brace stakes for his red Irish setters Raleigh and Lorna. This was awarded, it will be remembered, to Glen and Ned. The two protests were not sustained by the Club.

A resolution was then adopted limiting the number of entries in the puppy stakes to be run next autumn to twenty-five; their ages to be not above eighteen months; the prizes to be $100, $50, $25 and $15; entry fee, $15; forfeit, $10. In the all-aged stakes entries will be limited to fifty; prizes, $200, $100, $50 and $25. In the brace stakes the prizes are $250, $125 and $75. Entry fees and forfeits in last two stakes the same as in the puppy stakes. The nursery stakes are open to puppies under one year of age at date of trial; prizes, $60, $40 and $20; entry fee, $10; forfeit, $7.50. The nursery stakes will be run on the first day of the trial.

The club also offer a piece of silver plated, of the value of $100, to be selected by the winner and to be contested for only by members of the club; for dogs of any age; contestants to handle their own dogs. For this the entry fee is ten per cent. of the value of the prize, and the entries are not limited.

Monday, Nov. 29th, was decided upon as the day for beginning the trials. Tuesday, the 13th inst., at six o'clock, was named as the day for the meeting to elect officers for the ensuing year. The following gentlemen were elected members of the club: Erdmann A. Herzberg, New York; John B. Goodwin, Norwich, Conn.; T. N. Hall, J. G. Heckscher, H. Geiger, and Charles Heckscher.

—The bench show of dogs which it was proposed to hold in connection with the exhibition of the Western New York Fanciers' Society, at Albany, Jan. 20th, has been postponed for lack of room.

Furs and Trapping.

SNARING A DEER.

SOME years ago, with a number of gentlemen, I spent a considerable time in a section of country known as the "rice lands," and having an abundance of leisure we devoted much of our time to hunting. Many pleasant and interesting incidents occurred, some of which, as you find space for them, I will furnish for your excellent journal.

The section referred to was almost in its primitive condition, and abounded in lakes, rivers and swamps, with vast pathless forests almost untrodden by man, and in which game of all kinds was abundant—almost "stacked" up. Each one of us might justly be termed a fair shot, and we were certainly eager, if not very discriminating sportsmen. Shortly after locating ourselves we began an extensive and thorough survey of our surroundings, bringing into play for our use all the intelligence and knowledge of the "rice hands" with which we frequently met. For awhile we could scarcely understand anything they would say, but eventually we became used to their primitive ways and talk, and passed many pleasant hours listening to their incredible stories, told with so much earnestness as to leave no doubt as to their own belief in them.

One exciting incident I will relate now. One evening, while enjoying our pipes and relating our hunting experiences, the subject of snaring deer was brought up, some of the party declaring it impossible, contending that deer were far too intelligent and too wary to be entrapped; others, again, declaring its frequent occurrence. The discussion waxed warm, and finally it was determined that we would make a trial of it for the satisfaction of all, the entire arrangements being left in the hands of myself and Joe Th——.

Intending to give the matter a fair trial, we made our preparations with great care. After scouring the woods for several miles we selected a broad sandy knoll, where could be seen thousands of deer tracks. This knoll was bounded on the south and west by large bodies of water, and north and east by a dense forest. After a little search we found a large oak with a sufficient but not too large quantity of mistletoe. We felled the tree and carefully removed all except a few bunches of mistletoe, which we left in one spot. (We had known pot-hunters to cut down a mistletoe tree and then, after nightfall, secrete themselves near and shoot the unsuspecting deer as they came to feed upon their favorite food, and hence our selection of bait.) Next we formed a slip-loop at one end of a half-inch rope, the other end of which was securely fastened to an adjacent tree. The mistletoe remaining on the tree was in such situation that a deer in feeding would necessarily have to reach upward, and around this mistletoe was arranged the slip-loop, and in such manner that a little shaking of the bushes would cause the fall of the rope. A deer in feeding would reach

yard through the loop, the act of feeding on the shes would shake them enough to throw the rope, hich latter would necessarily encircle the neck of the nimal. Having completed our work and carefully removed all "sign," we returned and reported progress.

The next afternoon we rode over and made an observation, but failed to find a deer hung by the neck, and at night, gathered around the fire, we had good-humoredly to put up with considerable jeering from our incredulous comrades. However, the next day we were rewarded for our pains and care by finding a buck—a very king in size—securely fastened by the antlers, instead of around the neck. Either the loop was too small or the wide-spreading antlers were too large; anyhow there stood the buck, securely fastened. In his efforts to get away he had run to and fro around the tree to which the rope was fastened so often as to make a "circus ring," digging quite a trench with his sharp hoofs. He was completely tired out, and stood panting from his unwonted exertion, all the fire gone from his magnificent eyes, the very picture of dumb despair.

But now, here is where came in the laugh which our fellows enjoyed at our expense. Feeling sure that if we snared a deer it would be dead by the time we reached it, we had left our guns at home; but even now we felt no need of them, for from the thoroughly used-up appearance of the buck we thought there would be no difficulty in managing him, Joe even suggesting that we take the end of the rope and lead him triumphantly home. All this while we were approaching the deer, and just as I reached out my hand to secure the rope, like a flash of lightning the fire returned to his eyes, his mane bristled up, he made a jump to get beyond my reach, the rope broke, and in less time than I take to write it the deer was out of sight in the forest. Never were two mortals so sorely, so terribly disappointed. I sat right down on the sand, and for ten minutes not a word was uttered by either of us. At last we examined the tree, and we found the rope had been worn to a frazzle. The old fellow had been frightened into new strength by our approach, and found no difficulty in breaking the rope, carrying away with him at least eighteen feet.

Although we had to stand any amount of chaffing, we had verified our assertion that a deer could be snared. In a short time the mishap became generally known, and after that for a time we could hear occasionally of some one having crossed the trail of this buck with the rope dragging on the ground. At last one day a gentleman living a few miles distant rode over and presented us with the rope. He had been out on a still-hunt the day previous and was so fortunate as to bag the old fellow.

Washington, D. C. HAIR-TRIGGER.

CAPTURING A MOOSE.

SOME years ago a party of four of us started out from Richardson farm on Mollychunkamunk Lake for a moose hunt in the month of March, going northwest up the lake and toward the Cupsuptuc beyond. We struck signs about noon, after having travelled some ten or twelve miles on snow-shoes, there being about four feet of snow.

That night we had killed the old mother moose and dressed her off, and had the skin for our bed in the snow and the marrow bones to roast, and some of her steak to fry.

Early the following morning we started the calf up the mountain on a brisk chase, our crew being all fresh as well as the dogs, and soon brought him to. This moose-yard contained but these two. On coming up with this youngster he broke loose from the dogs and made a grand run down the side of the mountain toward the level country, but we were able to keep within easy range of him, and as the snow-shoeing was excellent we determined after a short consultation to capture him alive if possible. One of our party, Gideon Stone, was a man over two hundred avoirdupois, and an active, courageous hunter, well experienced in moose hunting. He started with giant strides down the mountain after him, and in less than half an hour jumped upon his neck and plunged him into the snow and held him fast until the rest of us came up. This was no baby moose to look at or handle; he stood quite six feet high—a long geared, slab-sided, rough looking customer. After having tried in vain to lead him, it being but a short distance across to where we left the cow moose, we determined to tie him up in his mother's hide and sling him on poles and lug him out to the lake, some three or four miles away. This arrangement took us until noon of the second day, when, after eating our savory meal of fresh moose and bread, we commenced operations. We soon found that we had a big contract on our hands, for the weight of the moose caused us to sink to a great depth in the snow and soon tuckered us out. We managed to get him some half or three-fourths of a mile and had to give up this plan. It was now nearly four o'clock in the afternoon, and we held another confab and came to the conclusion to send two men out to Rich's farm, from whence we started, for a moose sled. After they were gone we fixed up for camping ourselves comfortably, by digging away the snow with our snow-shoes and building a big fire, and built up a pen of logs seven or eight feet high and just large enough inside for the moose to turn around in, and laid some poles across the top and let him loose in it, for it was a bitter cold night and he would have frozen if left confined.

About 10 o'clock the next day the two men returned with the sled, and we were soon underway, taking turns two at a time at the sled and the other two swamping ahead, for his legs being so long we had to cut quite a path through the woods to get along. We reached the farm and housed our game in the barn that night, after a three days' cruise of much hard labor and considerable excitement and fun. We found the moose would readily eat corn-fodder and oats, and eventually learned to eat hay. He soon became quite docile, and was led out from the lakes by one man some twenty miles, and after a time was sold to a travelling menagerie for about fifty dollars. Mr. Stone, who did the hard st of the scrimmage, has since hunted several years in Washington Territory, and has lately gone to the good hunting ground beyond.

Bethel, Maine, Dec., 1879. J. G. R.

FOXES.—Connecticut is full of foxes this year. The woods about Watertown, Litchfield County, are reported to be infested with them.

Answers to Correspondents.

No Notice Taken of Anonymous Communications.

L. U., Easton, Pa.—We know nothing of the shell you speak of.

P. L., Boston.—Your dog is troubled with worms. See reply to H. S. in this column.

W. W. H., Lowville, N. Y.—The insects were weevils, a common insect infesting dry groceries.

J. H. S., Rockford, Ill.—The fox terrier is a cross. The advertisement you refer to is New York City.

OWNER, Albany.—Any of the yacht builders among our advertisers can supply you. Price perhaps $75.

PICKEREL, Fall River, Mass.—Advertise under our kennel wants, and you will receive the answers you need.

J. A. B., Williamsburg, Pa.—There is no better book on trout culture than Livingston Stone's "Domesticated Trout."

E. E. B., Meadville, Pa.—Your dog is afflicted with rheumatism. See answer to C. A. F. in this column. Both cases are alike.

H. N., Boston, Mass.—The author of the "History of the Cattle Trade of the Great West," is J. G. McCoy, Kansas City, Mo.

DEEP DRAFT.—Cannot again explain the cutter rig. Invest a few dollars for photos of English yachts and see for yourself.

J. W., Pittsburg, Pa.—An Irish settor pup five months old should weigh about twenty-eight pounds. Of course the weight varies very much.

A. F., Homer, N. Y.—Please inform me how to give Fowler's Solution of Arsenic? Ans. With water in a spoon, and pour down the dog's throat.

L. M. N., Philadelphia.—Will you please inform me through your paper if there are any black and white Gordon setters? Ans. Black, white and tan.

L. A., Applebach-ville, Pa.—You can have your muzzle-loader changed to a breech-loader by Clark & Sneider of Baltimore. Will cost between $50 and $75.

A. C. F., Fernandina, Fla.—For rubber hunting stockings send to Hodgman & Co., 425, Broadway, or to Goodyears's Rubber Manuf. Co., 488 Broadway, this city.

A. G., Fort Riley, Kans.—We used to know of a sporting paper published in Canada sometime ago; but we have not seen it for many months and presume it has suspended.

A. F., Wapakoneta, O.—Does it make any difference in field trials if the trainer speaks to his dogs in English, German, French or any other language? Ans. No, nor in deaf and dumb.

X., Pittsburg, Pa.—Can you give me pedigree of Eugenc's setter dog Jock, and of Patton's Kate, well-known in 1872? Ans. We are unable to do so, but perhaps some of our friends can.

CRICKETER, San Francisco, Cal.—The clubs of New York City and vicinity, are the St. George's, Manhattan, Staten Island, Columbia College, New York and Columbia; Newark and Paterson, of New Jersey.

M. I., Custer City, Dakota.—The best book for you is J. H. Batty's "How to Hunt and Trap," price $1.50. Address the author at Parkville, Long Island, N. Y. We should be glad to have some notes from you.

A. P., Butler, Ind.—You will find much practical information about the shooting grounds of the West, in the back volumes of this paper, and in future numbers also. See prospectus of our Fish and Game Directory.

L. R. LANDY, So. Framingham, Mass.—Is there any book published in regard to training setters? Ans. The book you want is "The Dog," by Dinks, Mayhew & Hutchinson, compiled and edited by Frank Forester. Price $3. We can furnish it.

E. A. R., Baltimore.—We can vouch for Mr. Clapham's sharps as equal to anything of the kind in model and build. Cost of building very moderate. Black bass do go in schools; no doubt those you saw were black bass. See Mr. Clapham's advertisement.

J. C. P., Milwaukee, Wis.—What is the best thing to do for my dogs' weak eyes? They are young black and tan puppies. Ans. Wash their eyes with a little tepid water three or four times a day. If there is any discharge, better not interfere much at so early an age.

JOSEPH, Halifax, N. S.—We shall be glad to give my assistance in our power, and the fact that your name is not on our subscription books will not be considered. We take it for granted that if a person wants an answer in these columns he must read the paper, one week at least.

S. T. L., Applebacksville, Pa.—1. By advertising in our Kennel Wants you will be able to get the dogs you want. 2. You may address Al. I. Gator, care of this office. The region about Titusville, Fla., and the country reached *via* that point, is probable the best in Florida for trapping.

Y. R. A., New York.—We consider the sailing measurement of the Seawanhaka Yacht Club about the best in vogue. Length multiplied by beam. Will take up the subject later on. Length is no criterion at all. Might as well sail on diameter of hawse hole, which would be just as rational.

J. D., Milwaukee, Wis.—King Charles' spaniel Sankey was entered in Westminster Kennel Bench Show, 1879, by L. N. Meyer, 45 Great Jones street, New York. Tricksey, by Clara, G. S. Long, 62 West Thirty-seventh street, New York. A. Kistermann's address is 157 East Thirty-fifth street, New York.

SANDY, Owen Sound, Ont.—1. The maker is of ordinary merit, but has no reputation in this country. 2. You may use leather wads, but no advantage gained. 3. For duck shooting, use No. 4 shot; for hares, grouse and squirrels, No. 6. 4. The rifle calibres in general use for hunting are from .38 to .44.

G., Highland Park, Ill.—You will find in Dakota the large game common to the West, deer, elk, bear, mountain sheep, etc.; geese, ducks, sharp-tailed grouse, ruffed grouse, etc. Should advise you to take a rifle. As the Indians are in an unsettled state we cannot advise you so far ahead as next summer.

A. M., Mobile.—It is too late now to bring up the question, as the prize has been awarded, and your protest against the other yachts should have been sent to the judges immediately after the race. Our decision one way or the other would be inoperative, and the evidence you send is not very clear.

C. F. M., Appleton City, Mo.—I have a beautiful Esquimaux bitch, four months old, and the last three or four days she has coughed almost constantly. I think she has distemper. Bowels and appetite all right? Ans. Keep your puppy dry and warm, give dose of castor oil, and watch for further developments.

E. D. G., Syracuse, N. Y.—In reply to your inquiry when the first match was played between cricketers of your city and the St. George's of New York, we have the score of a "friendly match" played at your place on Monday, July 22d, 1844, the visitors winning by an innings and 53 runs. Sam. Wright, 38; Syme, 23, and Wheatcroft, 27.

H. A. B., Charleston.—1. Carver and Bogardus shoot with both eyes open. 2. Three drachms of Curtis & Harvey's gunpowder are not equal to three and a quarter drachms of Orange, Dupont's or Hazard's, of the same grade. 3. A fair load for a 12-guage, 7-pound breech-loader for quail shooting is three drachms powder, one and one-eighth ounces shot.

G. B. H., Newport, Ky.—1. The material known as English twist is now used only in guns of inferior grade. It can be made equal to Damascus steel, and was once so manufactured and used by Grub. The laminated has succeeded it in the best guns of the present. 2. The thread in the thread-wound cartridges is wound outside of the tin and inside of the shell.

ENSIGN, Bradford, Pa.—The running from your dog's ear is caused by canker. Wash out with syringe, using castle soap and tepid water, and pour in two or three times a day a small quantity of the following solution: Sugar of lead, one scruple, mixed with one ounce of water. Your dog is also affected with mange, for which there is no better admixture than the following: Bi-carbonate of potash, one ounce; white vitriol, quarter ounce; sub-sulphur, two ounces, and lard eight ounces. Rub well into the skin morning and evening. Regular exercise and low diet.

ENQUIRER, Attica, N. Y.—I have a pointer pup, ten months old, which has had a diarrhœa for three or four weeks. He is very thin, and is almost nothing but skin and bone. Ans. Your puppy is probably suffering from the effects of distemper. If he strains much in his passages, give him an injection of a half to a teaspoonful of laudanum, thickened with starch water. If he does not strain much, administer the same internally. In either case, twice a day. You should also, three times a day, give him a tonic pill, composed of two grains of sulphate of iron and two grains of quinine. Have a druggist prepare the pills.

J. O. B., Boston.—Would advise you to devote the $500 to the purchase of a second-hand yacht in good condition, as you could only have a small craft built for that sum; about twenty-two feet water line, with hardly any cabin accommodations. Apply to Manning's Yacht Agency. For Florida game see our back files; little game from July to October; bay birds, rabbits, squirrel, deer, alligators and an occasional mosquito. An $85 Parker gun will remain tight enough through its life. The Slocum loader has given full satisfaction. To sell your second-hand breech-loader write to Squires, 2 Cortlandt street, New York.

S. M. AND OTHERS.—The following "sharpie rig" for canoes has been adopted by Commodore Chase and gives thorough satisfaction:—Mainmast, 2-inch spruce at deck, 10 feet 6 inches deck to head; steps 3 feet 3 inches from bow. Mizzenmast, 7 feet 4 inches deck to head; 1¼-inch spruce at deck, and steps about 3 feet 3 inches from stern. Both sails are triangular. The mainsail is 9 feet 6 inches luff, 6 feet 6 inches foot. Mizzen is 6 feet 6 inches luff and 4 feet 6 inches foot. Mainboom, 4 inch diameter in centre. Masts and booms may be jointed with a metal sleeve, so as to stow easily. Sails are bent to heavy brass rings or hanks around the masts, and hoisted by a single halliard bent to a cringle in the head or apex of each sail. Besides the two halliards only two sheets are required, one from each boom end. This completes the whole gear, and is much simpler and quite as effective as the complicated rigs in vogue in England, and on the Clyde. Reefs are not used; the mizzen being stowed in blowy weather.

H. W. C., St. Paul, Minn.—My setter bitch, a daughter of Berkley, and an imported bitch, is now fourteen months old. Last April she had the distemper very badly, and it left her afflicted with chorea. It is confined to her left hind leg. I cured it temporarily by the application of strong liniaments, rubbed thoroughly upon the leg and across the loins daily, but about a month ago it returned again, and I am seriously alarmed about her. Her leg twitches when she is standing up only. When she is lying down it is quiet, and she exhibits no signs of disease. She is at all times very lively indeed—is over ready for a romp, and never tires. She eats sparingly, but is in good flesh; weighs about forty-five pounds. Is there any cure for this leg-twitching? The bitch has never been lined; would it benefit her to go to a dog? Ans. Continue the friction treatment, and try the effect of one-eighth to one-quarter grain of nux vomica extract, given in pill three times a day for a week or ten days. She should not be bred from until well or older.

H. S., Philadelphia.—My dog at times seems in good health but in a minute more would seem to loose his muscular power, sinking down on the ground; will get up, go a few steps and do the same thing again. Would shove himself along the ground on his stomach, fall over and stiffen as if going to die, and in a few minutes would be all right again, spasms lasting about four or five minutes. No froth came from his mouth, and he did not seem like dogs that I have seen having fits; he knew me all the time, would come to me as if wanted me to help him; is about four years old; looks healthy, except very poor in flesh and has a sorrowful expression in his eyes; his nose is cool and wet, but he is often constipated to some extent in his bowels. He had stomach worms and part of a tape worm taken from him once. I feed him on table scraps, and he has a large yard to exercise in. I do not keep him chained? Ans. Your dog is evidently afflicted with worms. Give dose of areca nut evening and morning, followed by a half ounce of castor oil. Conroy, Bissett & Malleson, 65 Fulton street, New York, will furnish the powdered nut with directions for use. Follow for the next three days with a dessert-spoonful of table-salt once each day.

C. A. F., Wellsville.—My pointer dog pup, seven months old, has the rheumatism in his left fore shoulder. He has grown very rapidly, now weighing fifty-six pounds and measuring twenty-seven inches around the chest. I have given him plenty of good, wholesome food, but not much meat. His kennel is out doors in the open air, perfectly dry, and kept well littered with clean cut straw. About five weeks ago I first noticed that he limped, and then attributed it to a strain by slipping on the ice. Ever since then he has been lame by spells. In the morning when he first comes out of his kennel after a hard play-spell the afternoon previous, he seems quite lame. A short run and he gets over it He is in good spirits, and is strong for a dog that has grown so fast. He jumps the yard fence (three and a half feet high) with ease. I cannot make him flinch when I press on his foot, leg or shoulder, nor can I find any inflammation. When he is the worst off he seems to be quite chilly, and occasionally is in severe pain. Ans. If correct in your observation, the dog has either received a strain or suffers from rheumatism. Rub the shoulder with a good stimulating liniment, such as is used for horses. Administer internally one-half teaspoonful of bi-carbonate of soda (bakin soda), dissolved in a little water, three times a day.

FOREST AND STREAM
ROD AND GUN

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

FOREST AND STREAM PUBLISHING COMPANY.

—AT—

NO. 111 FULTON STREET, NEW YORK.

[POST OFFICE BOX 2832.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Advertising Rates.

Inside pages, nonpariel type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial column, 50 cents per line—eight words to the line, and twelve lines to one inch.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

***Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, JANUARY 8, 1880.

To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith and be addressed to FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. Anonymous communications will not be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of mail service if money remitted to us is lost.

☞ Trade supplied by American News Company.

CUVIER CLUB.—The Cuvier Club, of Cincinnati, Ohio, held its sixth annual reception January 1st, when the club members and their friends met and reviewed the field days of the year. The Cuvier's receptions are always pleasant.

A WORD TO CORRESPONDENTS.—We trust that the numerous friends of the FOREST AND STREAM whose names are upon our list of contributors will understand that no disruption of their relations to the paper has been made by ourselves; and we indulge the hope that they may not themselves elect to discontinue their kindly offices. A newspaper has much of the character of an individual. New friends are sought and valued, but the old ones are none the less cherished. The FOREST AND STREAM looks constantly ahead and aspires to greater and constantly growing excellence in the future; but it is not unmindful of its past nor of the friends who have done so much to make it the journal it is to-day. Our readers will still see the familiar signatures to news notes and sketches of travel, and no one will welcome these more than ourselves.

—We publish to-day the last paper of the Nepigon series. The information contained in these six letters is of an exhaustive nature and we cannot too strongly urge their value as a guide for tourists to that region.—We shall next week give the first of a series of articles describing a canoe trip of two hundred miles down the East Branch of the Penobscot.—The description of the trip up the Upper Saguenay is the first of that country which has ever been published. This American Continent is broad enough to furnish fresh material for racy *reconteurs* for a century to come.

—Our letters for the last fortnight have been filled with Christmas and New Year greetings. It is very pleasant thus to know that at the gatherings of various clubs and associations the FOREST AND STREAM has not been forgotten. The mail one morning brought one of Marcus Ward's handsomely illuminated holiday cards, which the sender put in as his "Fish Swallowing Fish" contribution. The design was a water scene; a duck seizing the bait of an angler, and the huge fish beneath in turn seizing the duck. Is it possible that the famous London designer has seen our fish stories in time to catch the idea? The legend on the card runs:

Tho' friends attract you t'other way,
We'll look for you on Christmas day.

DIRECTORY TO GAME AND FISH RESORTS.

ALMOST important portion of the work of the FOREST AND STREAM has been done in discovering and making known to its readers the game resources of different sections of the country. We have constituted ourselves a bureau of information for the benefit of the public, giving specific instructions when and where to go. Such information we have always striven to make as trustworthy as our sources of knowledge would admit. Some years ago, by a system of circular letters, we gathered a vast supply of local information from every State in the Union. Since then there have been material changes in the stock of fish and game in many sections, as well as improvements in the facilities of travel, accommodations provided for tourists, etc.

We, therefore, feel the necessity of revising our present knowledge, and to that end have opened a FOREST AND STREAM Game and Fish Directory, which is designed to serve as a medium of communication between sportsmen tourists. Into this Directory it is proposed to gather all available information of this character which may be of service to our readers. We earnestly invite the coöperation of those who have knowledge of sporting grounds, and are inclined to make the same known to others. We ask no one to reveal the one particular spot of which he alone knows, and which he would not see invaded by the foot of the stranger. There are scores and scores of favorite streams full of trout, and stretches of woodland where the birds fly and the deer bound, whose location is jealously guarded from season to season by one or two. The way thither we should not care to know; more than this, we warn our friends not to tell us of them. But on the other hand, there are numberless hunting grounds where the game is abundant enough to afford sport for all who come, and streams which are in no danger of being fished out. To make these known is our mission, to accomplish which we shall not hesitate to call upon our readers, correspondents and friends. With their aid the FOREST AND STREAM Game and Fish Directory may be made so complete that no one need stay at home because he is at a loss where to go, and a sportsman setting out on a business or recreation tour to a distant State may know whether or not to take along his rod or gun. To insure trustworthiness, we shall, in very case where it is practicable, require the name of some resident to whom inquiries may be addressed, and who will, therefore, be personally responsible for the information given.

In our Game Bag and Gun column we have designated just what is desired. The particulars asked for may be compressed into the limits of a postal card, and we shall look for ready responses from every county, town, hamlet, post, camp and lodge in the United States and Canadas.

FAILURE OF THE Y. R. A.

OWING to the lack of representation and want of coöperation of the more influential clubs, the proposed National Yacht Racing Association has fallen through. This was to have been foreseen, as the composition of the committee having the preliminary arrangements in charge was in some respects not such as to meet with approval. The many estimable gentlemen who lent their names and time to the movement certainly deserve and have our sympathies. It was their misfortune that, unknown to them, the very initial steps should have been allowed to pass largely into the hands of a notorious confidence operator, whose association with any such undertaking is quite enough to debar the most praiseworthy object from general public support.

That the formation of a Yacht Racing Association is something devoutedly to be wished for, all the leading clubs are ready to admit; but however much they may desire to bring about its accomplishment, their support, under the circumstances, was out of the question. The fair name of American yachtsmen is not to be traded upon nor made a lever by a common "rounder" for the furtherance of his own small ends.

"It is an ill wind that blows nobody good," and the failure of the Y. R. A. is not without its compensating benefit. A most effectual set-back has been given to an individual and his crew who have made a great deal more noise than either their capacity or standing in public opinion would entitle them to. Yachtsmen are not yet prepared to link their good name with the unsavory reputation of a scouse-kettle hero and his hawsepipe following, and in their refusal to countenance the machinations of a fellow in bad odor have given a decided voice to opinions long entertained.

We believe that the junior yacht clubs will likewise learn to distinguish between reputable journalism—which has their interests at heart quite as much as those of the larger clubs—and the catch-penny sheets, no sooner floated than exhibiting an unhealthy leaning towards the odoriferous precincts of the Sheriff's office.

As the miscarriage of the first effort does not in any way imply the lack of necessity for a Yacht Racing Association, it is to be hoped that the gentlemen who have been identified with the first move will not lose heart, but will once more set to work, the better prepared by the experience already gained. Personal application to members of the leading clubs will be much more effectual than putting one's trust in minor sheets without reputation or circulation, and a combined effort in which the large clubs are well represented will of course be preferable to any other plan of organization.

MILITIA RIFLE PRACTICE IN 1879.

THE report of the General Inspector of Rifle Practice for the State of New York, published in synopsis under our rifle department, will be instructive and should be suggestive reading to the officers of militia in every other State of the Union. The years are very few since the National Guard of this Empire State began to know the rifles with which they were provided. From mere dummy weapons they have really become arms of offence and defence. From being almost an aggregate of helplessness, the 17,000 armed citizens of the State have been moulded into a formidable force of skilled shots, able to make themselves felt in a deadly fashion should any misfortune of war or riot ever call upon them to exert their powers. We have made wondrous strides of progress, for we started from nothing, yet there is a great aggregate in that fourth class of "men who have not visited the range," who are what the whole of the National Guard of the State was a decade ago. They are valueless except to count at parade. They are dead wood on the tree and should be lopped off. It shows a very bad state of discipline when two of the city regiments, with an aggregate muster roll of 1,318, have to return 846 men as never having obeyed the orders to practice upon the ranges. There are bright examples of proficiency to light up this dismal end of the picture, and to the separate companies all over the State much praise is due for the care which they have shown in making themselves competent to use the rifles they have sworn to carry. The Seventh Regiment heads the list of metropolitan organizations, and a showing of nearly half its nominal strength as marksmen conveys in an indirect but none the less positive manner, what a power such an organization would be when drawn up in an effective position and ordered to send a volley of lead at a turbulent mob. It means an instant quelling of that riot by the wiping out of a good percentage of that particular mob.

The report is instructive to the general rifle shooter by the data it presents as to the demerits of a .50 calibre compared with a .45 or .44 calibre weapon. The State of New York possesses a good weapon in a hundred points, but with one overpowering objection. First and foremost, a rifle must shoot well, and this the New York State model rifle does not when brought into comparison with other military rifles. The fact that it is of simple mechanism, easily kept in repair, easily handled, safe, and cheap, are minor considerations, and weigh but little against this one fatal objection.

To officers of the National Guard in other States the practice of the New York guardsmen has been in the nature of a pioneer movement. The whole National Guard system in this country is in a wretched state of neglect. There are skeleton organizations in several of the States, but in the majority of the commonwealths there is only a cold, barren ignoring of the whole question of the protection of the citizen by the citizen. What can be done New York State has shown, and in view of this showing, as detailed by General Wingate, the oft-heard assertions that National Guardsmen cannot be brought to a high state of efficiency as marksmen, are disproven by facts and figures. What New York can do other States can do, and in many cases they have the advantage of this great urban State. There are facts in this last report which might be taken as the basis of action by some wise legislator in each of a score of Assemblies and Senates. They mean that New York, by the expenditure of a few thousands of dollars annually, is in a position to protect herself against the loss of the millions which riot violence let loose for a few brief hours may cause to her treasury.

To General Wingate, who makes the last of his reports as an official of the National Guard, sufficient credit cannot be given for what he has done in behalf of an enlarged system of rifle practice. Often blundering and forced in a large degree to feel his way along, he has had for a dozen years past one determined object in view, and its accomplishment is very largely seen in this report for 1879. He has been styled the Father of American Rifle Practice, and well deserves the title. To him more than to any other man in America is due the credit for whatever America has gained of credit in this line of sport. The spirit was there; the ability needed only a guiding hand; but it was Captain Wingate, of the Twenty-second Regiment, who began the work; Colonel Wingate who applied the match which started the brilliant flame of our international small-bore contest; and General Wingate who leaves for his successors a perfected system of rifle practice for the troops of this State.

FOREST AND STREAM IN THE SICK ROOM.—Victor Cherbuliez tells of a famous and skilful physician, who administered to his patients all the medicines of the schools, but when ill himself, he used only one simple remedy distilled from a little flower growing high up on his native Alps. The healing virtues of the draught may have been not more in the herb itself than in the mountain scenery, the pure Alpine atmosphere and the youth giving associations of his childhood's home. Be this as it may, fresh air, sunshine and rest are Mother Nature's remedies for soul sickness and bodily ill. It is not always possible, however, to avail oneself of these, even though they be without money and without price. When the mountain would not come to Mahomet, Mahomet went to the mountain. In these later times if we can neither bring the mountains to us nor go to them, we can at least catch much of their spirit in the printed sheet; and so it is that many invalids find in the FOREST AND STREAM something of the benediction of the woods and streams. He is a considerate physician who stuffs his pockets with copies of the paper and administers them along with the remedies of the pharmacopœia. Here is what is written of a sportsman doctor: "As for myself, I have had the benefit of the paper for more than a year through the kindness of my physician. I have been a miserable invalid for years and I can say this much for a sportsman doctor, that he is the kindest, the most patient, and the most successful of any man of his profession that it has been my good fortune to meet."

—A curious bit of the moonshine superstition—familiar to our readers by its discussion in these columns—has been developed by the current debate about Edison's electric light. A New York "Ph. D." with all seriousness urges as a final objection to the use of the light that it possesses the baneful properties of the moon's rays, and if generally used it would exert a malignant influence upon every one exposed to it. Had this Doctor of Philosophy allowed the light of the FOREST AND STREAM to illumine his understanding, there would have been no need of thus making himself a laughing-stock in the public prints. *Esto lux.*

GAME PROTECTION.

GAME LAWS OF SPAIN.—Sport in Spain has something of the zest of tiger hunting when the tiger is doing the hunting. The sportsman there must hie him away to the wilds if he would find game, and that is a rather dangerous proceeding if he happens to be rich, for the hills are infested by gangs of robbers who do not hesitate to bag a sportsman and demand a heavy ransom for his release. The country is generally not posted, and the game law code is substantially as follows:—

1. Land owners may shoot over their own property all the year round. 2. Shooters over public grounds must not shoot in the close season. 3. The close season is from April 1st to September 1st in northern, and from March 1st to September 1st in southern Spain. 4. No guns may be fired in snowy or misty weather. 5. Angling is allowed all the year round, but net fishing is forbidden to all from March 1st to July 30th. 6. Decoy birds and nets for birds are only allowable for flights of quail and stock-doves.

MICHIGAN SPORTSMEN'S ASSOCIATION.—The Fifth Annual Session of the Michigan Sportsmen's Association will be held at Bay City, on Tuesday, Feb. 3d next, and continue two, and perhaps three days. The most interesting and profitable meeting yet held and the largest attendance since the organization of the association are indicated and confidently expected by its officers and members. Every sportsman in the State, whether a member of a club or not, is invited; every fish culturist and fisherman in the State is urged to be present; breeders of sporting dogs should attend; all interested in the study of natural history, especially the game animals, birds and fishes of the State should be there, to impart and to receive information of mutual benefit to all. Disappointed, but not discouraged, in their failure to secure better and wiser game laws at the last Legislative Session, the State Sportsmen's Association will renew their efforts in the interest of game and fish preservation, and ask the coöperation of all good citizens in this cause. If time permits, after the legitimate business of the convention has been disposed of, the Bay City sportsmen will provide a glass ball shoot for the entertainment of their guests. Places of interest will be visited, while a trip to the "city (of fishermen) on the ice" on the Bay is among the possibilities, which will be of itself a feature of great interest. Visitors are assured of a hearty welcome, and that they will be well cared for with the hospitable courtesy characteristic of the Bay City Sportsmen. The Secretary is H. B. Roney, East Saginaw.

MIGRATORY QUAIL—*Washington Pa. Jan. 3d.*—We imported one hundred migratory quail last season, they arrived in excellent condition, without the loss of a single bird. When let loose they displayed a degree of wing power really surprising, when we consider their long confinement. I let loose two pairs on my farm in good cover. They flew away at once into a large field of sturdy wheat, then just heading, and I have not seen one of them since, although, about October 1st, hunted over the farm assisted by a half son of Nellie, without standing or uncovering a single bird. I then gave up all hope of their success in this region, and remained under that impression until about November 1st, when one of my men ran across a covey of about twenty young birds within two hundred yards of the spot where I first let them escape. Since then we have seen nothing of them. Reports from other parts of the country, are similar to my own. We still hope that a number of birds were hatched, and that the gentle spring zephyrs may return them to us in increased numbers. X. Y. Z.

The Rifle.

N. Y. NATIONAL GUARD PRACTICE IN 1879.

THE report of the General Inspector of Rifle Practice of the State of New York has just been made to the Adjutant General of the State. It is a highly satisfactory showing of the work of a large number of men, and shows that the Empire State is an unquestioned leader in this part of the full duty of a State. In previous years the matter of rifle practice was so new, and the difficulty in creating an interest so great, that the main endeavor was to encourage the troops to shoot as much as possible. Demands for ammunition and transportation were honored by the proper officer to an unlimited extent, but at the close of the year 1878 the condition of rifle practice in most, if not all, the several organizations had become such as to render no special encouragement necessary beyond the issue of such ammunition and transportation as were required for the practice exacted by the State, with a reasonable amount for team shooting. The amount fixed upon was sixty rounds per man on the muster roll, with extra allowance for team practice; but a failure of funds made it necessary that only forty rounds per man for all purposes should be issued, and so it was ordered. There has been a uniformity of practice during the past year more than in any previous year. There has been a rigid compliance with the rule requiring each man to use his own particular rifle. The report passes in review the thirty-three ranges which have been established in this State and which are used as places of practice by the members of the National Guard. In establishing the first ranges the tendency was to make them too large and too expensive, it being expected that they would receive more support from the public at large than experience has shown to be the case. The general policy of the military authorities has been to establish in each Division district a large central range on which the Division matches could be shot, and then establish other ranges of smaller size readily accessible for local practice. Ranges permitting practice up to 600 yards have been the rule.

Creedmoor is the original range of America, and from 1873 to 1875 was the only official shooting ground. The other ranges are at Yonkers, Ellenville, Sing Sing, Poughkeepsie, Kingston, Newburgh, Hudson, Grand View Range, near Albany, Troy, Glen's Falls, Saratoga (range abandoned), Whitehall, Port Henry, Malone, Syracuse, Auburn, Moravia, Oswego, Watertown, Lowville, Utica, Oneonta, Rochester, Elmira, Binghamton, Penn Yan, Buffalo, Ellicottville, Batavia, Warsaw, Westfield and Jamestown.

The system of practice pursued, after many changes in first years of rifle practice here, has at last been fixed on what appears to be a definite plan, as suggested by the meetings of the regimental and brigade inspectors of rifle practice. It is a system which should be adopted in other States where attention is paid to rifle practice, so that a ready means of comparison should be had at all times between the forces of several States.

Each organization is now divided into four classes. Each man starts in the fourth class. As soon as he shoots in class-firing he passes into the third class, without regard to any score he may make, he having necessarily learned more about loading and firing his rifle than men who have never visited a range for practice.

The third-class shoot (standing) at 100 and 150 yards; the second at 300 yards (kneeling), and 400 yards (lying); and the first at 200 yards (standing), and 500 yards (lying). Each class fires five shots at each distance, and, to qualify, must make 25 points out of a possible 50. No sighting shots are allowed.

A final classification is made of each organization in November of each year, and its "figure of merit" computed by allowing:—

For each man who has become a marksman	. . . .	100
For " " remaining in the first class	. . . .	60
For " " " " " second class	. . .	30
For " " " " " third class	. . . .	10
For " " " " " fourth class	. . . .	0

These figures are aggregated, and divided by the number (present and absent) of the organization as shown at its last annual inspection, the result being its "figure of merit."

There have been received detailed reports from organizations numbering 17,251 men, as against 17,623 in 1878, 13,343 in 1877, 10,946 in 1876, and 7,670 in 1875. The small falling off in 1879 is accounted for by the fact that the artillery organizations have, in accordance with instructions, mainly omitted to report.

The number of marksmen for 1879 is 3,641, as against 3,059 in 1878, 2,126 in 1877, 918 in 1876, and 533 in 1875. The number remaining in the several classes in the two years just passed, were as follows: First class, 1879, 858; 1878, 793. Second class, 1879, 2,534; 1878, 3,152. Third class, 1879, 2,155; 1878, 2,573. Fourth class, 1879, 7,973; 1878, 8,049.

The highest "figure of merit" was won by the Ninth Separate Company, of Whitehall, Captain Bascom. He has seventy-two men, and fifty-six of them became marksmen. The figure was 95.64. The Thirteenth Separate Company of Warsaw, was next with 77.07; the Seventeenth Separate Company, of Flushing, next with 68.54; and the Sixth Separate Company (the Citizen's Corps, of Troy) next with 63.27; the Eighteenth Separate Company, of Glen's Fall, followed with 60.48. These five companies have an aggregate marching roll of 328 names. The highest regimental "figure of merit" was taken by the Seventh Regiment—58.64 against 42.05 last year. The regiment had 854 men, total strength, and 411 became marksmen, while 145 members of the command did not visit the ranges.

It will be seen that the Separate Companies lead the large organizations. This is on account of the interest taken by their officers, bringing out all the men and reducing the non-attendants to a minimum. Besides, the Separate Companies are country organizations, being in towns or large villages where the range is readily accessible, and the men are in many cases accustomed to the handling of firearms. Twenty-four companies in the State have got a "figure of merit" of over 50. These include the Ninth, Thirteenth, Seventeenth, Sixth, Eighteenth, Twentieth, and Thirtieth Separate Companies; Companies H, I, E, C, F, B, G, and K of the Seventh Regiment; Company A, of the Forty-eighth; Companies A, B, E, and G, of the Forty-ninth Regiment; Companies D and C, Sixteenth Battalion; Company D, Twenty-third Regiment; Company B, Twelfth Regiment.

The work on the ranges has been admirably well performed. The method of handling the troops at all the larger ranges, and the performance by officers and men of the detail connected with the close firing of a regiment, assimilate very closely to the duties required during service in the field. The bronze marksmen's badges with the many bars, have been replaced, in the case of marksmen of five years standing, by a silver medal consisting of a silver Greek cross with a bar inscribed, "Veteran Marksman."

Great pains have been taken to explain to the various commanding officers that the fundamental principle of the system of rifle practice, is that accurate shooting is a necessary result of drill, to be carried on by the company officers in their armories during the drill season, and that practice upon the ranges is mainly intended to test the lessons previously taught. It is the duty of the company officers to instruct their men during such drill season in shooting, and that the success which will be attained on the ranges and their company "figure of merit" will be in exact proportion to the care given in this particular. The figure of merit of most companies owes its largest reduction to absentees from practice, and that that company is relatively superior which reduces its third and fourth class to a minimum as compared with that having a number of marksmen with high scores but a large proportion of uninstructed men.

The following remarks on volley firing are the conclusions reached by the Inspector:—

The limited amount of ammunition available has prevented any practice in volley firing, except such as has been voluntarily practiced. This is to be regretted. Volley fire is that which would be used in all conflicts in cities, which are those in which the National Guard are most likely to be called upon to participate. Experience has shown that with a little drill men can shoot by volley with almost as much accuracy as in individual shooting. The firing by volley is much preferable to that of firing by file, in all cases where aim is required to be taken, the men not being interfered with by their companions in the ranks, and the smoke lifting much more quickly from a volley than where it is constantly renewed as in file firing. Firing by volley is also valuable from its permitting the expenditure of ammunition to be kept under the control of the commanding officers, a fact which with the breech loaders now in use is of the utmost importance. Soldiers firing by file in ranks become quickly from a volley than where it is constantly renewed as in file firing. Firing by volley is also valuable from its permitting the expenditure of ammunition to be kept under the control of the commanding officers, a fact which with the breech loaders now in use is of the utmost importance. Soldiers firing by file in ranks become excited from the haste around them and fire faster and faster, using up their ammunition to no purpose, and becoming nervous. When they listen for their officers' command they are more apt to remain steady.

The objections to the carbine as issued to the State are renewed, and this useless little arm characterized in proper terms. The .50 cal. Remington rifle, which is the State arm, is described as antiquated, in view of the fact that the Government arms and all newly adopted rifles have the .44 or .45 calibres. A weapon carrying the Government cartridge is the arm to be sought for. The scores for the several State matches are appended to the report, which is full in other respects not here touched upon, and it is noteworthy that while nearly a million cartridges have been used during the year at State practice, and many more in private practice, not an accident of any kind is reported.

MORE EXPERIMENTS BY RABBETH.—*Providence, R. I., Dec. 28th, 1879.—Editor Forest and Stream:*—*Sir*—Wishing to know the truth about that new-fangled projectile, the "express bullet," I recently procured small lots of 40, 44 and 45 calibres of the Winchester Metallic Cartridge Company and Sharps Rifle Company make. I was much disappointed in the appearance of both lots. Neither appeared to have been swaged at all. I wrote the Sharps Company expressing my disappointment at the imperfections apparent in their bullets. They replied that the bullets sent me were just such as they sent their other customers, and that they were satisfied with them. I tested the 45-305 gr. bullets very carefully also some I improvised by drilling out a Sharps military bullet (swaged and patched) 420 grs. to receive a long 22 calibre shell, same as those sent from the factory, weight now 345 grs. I fired eight consecutive shots in a N. M. Sharps Rifle, 200 yards from rest, using .90 grs. 'FG powder. The group made with bullets sent from factory required a 16-inch circle to cover them. Those I drilled out were all grouped in an 8¼-in circle. The drop of the factory bullets in the second 100 yards was 15½ inches, that of the improvised 16½ inch. I then wrote the Sharps Company giving the results of my tests, and remarked, that "when a hunter had tramped all day to get a shot at large game it was of the utmost importance that his ammunition should be as perfect as possible, and that, as between two kinds of bullets having the difference in accuracy which these appeared to have, the inferior kind could not be given away except as old lead, after the difference once became known to those using them." At the same time I made the above test I also fired eight consecutive shots from a Peabody-Martini military, using 100 grs. F G powder, 480 grs. bullet drilled out to receive long 22 calibre shell, weight 431 grs. Group 8½ inch; drop in second 100 yards, 13¾ inch. I did not test the 40 calibre Sharps express bullets, as they appeared quite as imperfect as the larger ones. The Winchester Metallic Cartridge Company's 40-225 grs., tested in a Peabody-Martini sporting 26-inch barrel, using 75 grs. F G powder, 200 yards from rest, required a 14-inch circle to cover eight consecutive shots. Drop in second 100 yards, 15 inches. Eight consecutive shots, same time and distance, 330 gr. bullet (swaged and patched), drilled out to receive a 22 calibre shell, weight 264 grs. grouped in a 6½-inch circle; drop in second 100 yards, 14 inches.

I find in using a light hollow-pointed bullet with paper patch, that it is essential to good shooting that the patch should be slit on one side nearly to the upper edge, otherwise the bullet will not upset properly to fill the grooves. In testing the Winchester Metallic Cartridge Company's

40-225 grs. on a former occasion, before I had made this discovery, I could not shoot them continuously into a 24-inch circle at 200 yards. I am satisfied that the hollow pointed bullet, when properly made, is superior to the solid projectile for killing game. When accurately made they shoot quite as close within 200 yards as the solids, but I have as yet seen but one decently made Express bullet in the market, that is the .50 calibre made for the new Winchester Express rifle. This bullet appears to be made as accurate as any of the long range projectiles. There is an objection to the hollow pointed bullet as now made which might be remedied. Instead of forming so large a hole in centre, thereby reducing the momentum, the bullet should be made in solid quarters, joined only at the base, and having a shallow tunnel-shaped hole in point. This would be sufficient to spread the quarters in striking game, and would have much greater range and killing power.

Some of the results obtained in testing the Peabody-Martini .40 calibre 26-inch barrel with different weights of bullets were quite surprising. This rifle is chambered to take a quite bottle-shaped shell, only 1⅛ inch long, so that 75 grs. of powder made a column only 1 7-16 inch in length. With this charge of FG powder I found that bullets weighing 225, 265, 285, 295, and 330 grs. have substantially the same elevation at 100 and 200 yards. There certainly is not a difference of more than 2 inches at the longer, much less at the shorter range. The 295 grs. which had round points (all others had flat) shot lower than either of the others at 200 yards, and did not shoot so accurate. I have now completed my experiments with the rifle at home, but purpose soon to renew them on game in Florida, of which I may possibly give an account at some future time. RABBETH.

ST. LOUIS, *Dec. 24th*, 1879.

Editor Forest and Stream:—

I have been looking for some one to write in response to Mr. W. Rabbeth's kind offer to give his experiments on a hunting rifle, but see nothing as yet, as he has picked the one of my choice, a 40x70. I would be exceedingly indebted to him or any one else for their results. I am in hopes he will succeed in making a light 200 grain bullet shoot accurate, and have waited a long time and often wondered if he got discouraged at the results he published with a Peabody-Martini. I would like to have an accurate description of the bullet used by Bear Paw in the 40 calibre, 80 grain powder, and would ask if the bullet was not 202 grains instead of 102 printed. I think we ought to have more on this subject, as most of us are in the dark as yet how to load a rifle to shoot accurately with a heavy charge of powder and a light bullet; Rigby and others use them. HUNTING RIFLE.

HIGHLAND PARK, Ill., *Dec. 30th*, 1879.

Editor Forest and Stream:—

I have been very much interested in the rifle tests as made by F. W. Rabbeth, Esq., and sketched in your issue of Nov. 20th, and have been anxiously looking for more. Has any person given the Winchester 1873 and 1876 model a similar test, if so, I should very much like to hear of the result. I have only used the Remington rifles and am in love with them, but desire a magazine gun, and when I buy, wish to get the best. I should like to know more particularly in regard to the accuracy of the Winchester, and also the relative merit, as well as force, of the two cartridges used. Shall we not hear from Mr. Rabbeth again, as well as from others? Also, would not a series of experiments with shot guns of a similar nature be beneficial and interesting? the parties making such experiments being careful to mention all the circumstances in the case, viz., name and size of gun, full, medium choke, or not; amount of powder, shot, etc., used, and so may we not also in our search after the best shot gun, also benefit, instruct, as well as interest each other.
W. B. D. GRAY.

EXPANSION OF SHELLS.—*Boston, Dec. 24th*, 1879.—I have read with considerable interest the communications on the expansion of Everlasting shells. Mine has been the same experience as "Bexar's." I use a .40 calibre Ballard everlasting straight, and on several occasions while out shooting have had to use the cleaning rod to punch out shell, and then with some difficulty. They commenced to expand the second or third time after using, and have bothered me since. It cannot be from careless loading or dirty shells, as I am very particular with both. I use dead shot FG powder. The rifle is a very fine shooter, and, I think, preferable to any other make. The suggestion of "Bexar" in Dec. 18th, 1879, issue, about paper rifle shells, is very good, I think.
V. L. S.

ANOTHER STICKER—*Rochester, Dec. 22d*, 1879—*Editor Forest and Stream*:—I have a Ballard rifle using the 44-75 Everlasting shell and have trouble with the shells expanding and sticking, and on several occasions I could not start them with the extractor, but have had to use a cleaning rod and drive them out. I have ruined two levers trying to get out shells that stuck, the shoulder that works the extractor giving way and bending so that the extractor did not work at all. I cannot account for it in any way except that it is the fault of the shell, as I have never used any but Hazard's FG rifle powder and always put the bullet into the shell through the ball seater, which is the same calibre as the shell and rifle, and an imperfectly cast bullet sticks in the ball seater. Out of fifty shells I got about a year ago with the rifle, over half are useless. I have tried filing them down, but they stick worse than ever afterwards. Perhaps the Ballard people, if they would say something, might tell what the trouble is, as they say in their catalogue "numbers of them have been shot 500 and more times." W. B. F.

—T. J. Conroy, of the firm of Conroy, Bissett & Malleson, on Dec. 20th last, in a match at the Bergen Point Rifle Range, with a 3-lbs. pull, 10-lbs. rifle, off-hand, made the following record:—

	Sighting Shots.		*Score.*										
Rings	24	25	24	22	25	25	25	24	24	24	22	24	227
Creedmoor	5	5	5	5	5	5	5	5	5	5	5	5	50

Mr. Conroy would like to hear of a score better than 227 in the 250 at Ring target, with 3-lbs. pull, off-hand, in a match.

WINCHESTER RIFLE MEDAL.

Young Eugene Bogardus bids fair to become almost as great a champion in glass ball shooting as his father, and although only a couple of years of age and under. This last was intended to draw out competitors against the young champion, but none appeared, and his record of 75 in a possible 100 was really a walk over.

The report of the match for the championship between young Bogardus and Dr. Talbot appeared in the last issue of the FOREST AND STREAM, with full score.

Capt. Bogardus thinks that if the rifle shooters at glass balls, which we hear of in such numbers throughout the country, have any claim to the scores they publish, they can now set all doubts at rest by a contest with the young champion who holds these medals subject to the skill of any man or boy in America to wrest them from him, and writes the following letter:—

ASTOR HOUSE, *Dec. 27th*, 1879.

Editor Forest and Stream:—

My son, Eugene Bogardus, having on Friday last won the only medal ever offered and contested for in a *bona fide* match at glass ball shooting with a rifle, although but fifteen years of age, stands to-day "champion glass-ball shot of America with Winchester rifle." As by the terms establishing this championship, the holder of the medal must defend the same for one year against all comers, I hereby give notice that I am at all times prepared to back my son against any one in a match for the championship medal under the rules which govern it.
A. H. BOGARDUS.

MASSACHUSETTS.—*Boston, Jan. 3d*.—A new match opened at Walnut Hill to-day styled "Everybody's match," and it brought a large number of riflemen to participate in what will prove one of the most successful matches ever shot at this favorite range. The Massachusetts Rifle Association has offered cash prizes of $200. Military rifles are allowed a handicap of two points, rounds ten, off-hand, at 200 yards. The intense brightness of the sun's reflection upon the snow to-day caused a severe blindness to many participants and affected the scores. The sky was cloudless, and the northwest wind, being steady, caused no trouble early in the day. In the afternoon the wind changed to the northeast, the bright sun had melted the snow from the "butts," and the white targets stood out boldly. Mr. Arnold's score was a magnificent one—nine consecutive bulls'-eyes—and his tenth a "nipper" at perfect elevation, and so close to the bull that the marker hesitated before putting up the red "disc." The match filled largely, there being fifty-five entries:

N. W. Arnold	5	5	5	5	5	5	5	5	5	4—49
W. Charles (Mil.)	5	5	4	5	5	4	5	5	4	4—46
H. Tyler (Mil.)	4	5	5	4	5	5	4	4	4	5—45
S. C. Noyes	5	4	4	5	5	4	5	5	4	5—46
E. F. Richardson	5	4	5	5	5	4	5	4	5	4—46
E. B. Souther	5	5	4	5	5	4	5	4	4	4—45
Captain W. H. Jackson	4	4	4	4	4	5	4	4	5	5—44
J. Nichols	4	4	5	4	4	4	5	4	5	5—44
C. R. Griffing	4	5	4	5	4	4	4	5	5	4—44
J. Borden	5	3	4	5	4	4	5	5	4	4—43
Salem Wilder	4	4	4	4	5	4	4	4	5	4—42

The winners in the silverware match, recently closed, were for the first class: O. M. Jewell, W. Charles, E. F. Richardson, W. H. Jackson, L. L. Hubbard. Second class: J. N. Frye, E. B. Souther, J. Borden, F. C. Brooks and H. Tyler. Third class: C. U. Meiggs, W. E. Guerrier, E. W. Archer, Sanderson and Stephens. Fourth class: C. R. Griffing, R. P. Buzzell, H. Roscoe, F. E. Simpson, E. W. McCall.

Medford.—The Medford Amateur Rifle Association opened a new series of competitions at Bellevue range, on Wednesday, Jan. 7th, at 12 o'clock M., and ended at sunset. It will continue each Wednesday, until the entries equal the value of the prizes and expenses. The conditions are as follows: 200 yards; rounds, 10; off hand; all comers: the scores to be aggregated. Entry fee for members, 25 cents; non-members, 50 cents for the first score each day; re-entries, 25 cents each. members divided into three classes and handicapped. In addition to the class prizes there will be a general prize of $15 gold, to be shot for by each class, but only once on each shooting day, and the score that will count is the first that is made by each competitor. At the close of the match the individual in each class that has won it the greatest number of times shall stand as the winner of the prize in his class. Then these three shall shoot off a score of ten rounds, and the one making the best average on his winning score shall become the owner. The person winning the general prize will not be entitled to any other. A prize of $20 gold is offered to any person making a clean string of ten bull's-eyes during any regular match.

MAGNOLIA RIFLE GALLERY, BOSTON.—The new "ring target" match is proving very popular. All the shooting is very even, and much above the scores made at a one-inch bull's-eye; distance, 100 feet; ten rounds. Following are the best scores:—

R. F. Schaefer	12	12	11	11	12	12	10	12	10	11—113
F. Hollis	11	11	11	10	10	12	11	12	12	12—112
N. C. Stone	12	10	10	10	12	11	12	12	9	12—110
W. Henry	10	10	12	12	11	12	10	11	11	11—110
J. R. F. Schaefer	11	10	10	12	12	9	10	12	11	12—109
H. Tyler	10	12	10	10	11	11	11	10	11	11—107
C. H. Russell	11	8	11	10	10	12	12	12	11	9—106
C. D. Harrison	12	11	12	8	12	12	10	10	11	9—106
N. W. Arnold	8	10	10	12	10	11	9	10	12	11—104
S. C. Noyes	8	10	11	11	11	10	10	10	12	12—103
F. L. Lawrence	11	10	11	11	12	11	10	12	11	11—110
J. S. Bennett	9	12	12	12	4	10	9	12	11	11—102
T. Baxter	10	10	10	12	12	12	10	9	11	11—105
A. C. Gould	12	12	12	11	11	10	10	9	8	7—102

The Marksmen's Badge match closed on New Year's Day, for which three pretty and valuable medals were offered by the management. Splendid results were achieved, and a large total shown by the participants. The following took prizes:—

F. Hollis	5	5	4	5	5	5	5	5	5	5—49
	5	4	5	5	5	5	5	5	5	5—49
	4	5	5	5	5	5	5	5	5	5—49
J. C. Smith	5	5	5	5	5	5	5	5	5	4—49
	5	5	4	5	5	5	5	5	5	5—49
	5	4	5	5	5	5	5	5	5	5—49
W. Henry	5	5	5	5	5	5	4	5	5	5—49
	5	5	5	5	5	5	5	5	4	4—49
	5	5	5	5	5	5	5	4	5	5—49

MAMMOTH RIFLE GALLERY.—*Boston, Jan. 1st*.—The regular monthly prize shoot ended with the best shooting ever done in the gallery. Mr. E. F. Richardson, of the Massachusetts Rifle Association, and Mr. W. H. Harrison, of Raymond Sportsman's Club, both succeeded in making a clean score of eight consecutive bull's-eyes, and they each received the special prize—$20. Following are some of the best scores; 150 feet; rounds, 8:—

Edw. F. Richardson	5	5	5	5	5	5	5	5	5—40
W. H. Harrison	5	5	5	5	5	5	5	5	5—40
U. A. Pollard	5	5	5	5	5	5	5	5	5—38
N. C. Stone	5	5	4	5	5	5	5	5	5—39
C. Edwards	5	5	5	5	5	5	4	5	5—39
J. Merrill	5	5	5	5	5	5	5	5	4—39
A. L. Eames	4	4	5	5	5	5	5	5	5—38
N. W. Arnold	4	5	5	5	4	5	5	5	5—38
A. C. Staples	5	5	5	5	5	4	4	5	5—38
E. F. Bassett	4	5	5	5	5	5	5	4	4—38
H. R. Shaw	5	4	5	5	5	5	5	5	4—38

Gardner, Jan. 3d.—In spite of the bright and dazzling sunlight the Gardner Rifle Club made some good scores at Hackmatack range to-day. Following are the scores, distance 200 yards, off-hand, two scores of ten shots each, using the fine-ring and Creedmoor target combined:—

H. C. Knowlton	R.	79	99	178
	C.	45	48	93
G. R. Pratt	R.	72	85	157
	C.	45	45	90
G. F. Ellsworth	R.	70	82	152
	C.	43	44	87
H. Pierce	R.	75	74	149
	C.	45	44	89
Chester Hinds	R.	68	62	130
	C.	44	43	87
S. N. Dodge	R.	60	64	124
	C.	41	43	84
William Austin	R.	54	52	106
	C.	41	42	83

Wakefield, Jan. 3d.—Good scores were made to-day in the January series, as follows:—

J. F. R. Schaefer	5 5 4 5 5 4 4—32	E. F. Brooks	4 5 5 5 5 5—34
D. H. Walker	5 4 5 5 5 4 5—33	E. P. Gleason	4 4 5 4 5 4 5—31

—The list of marksmen in the Second Conn. Regiment is a very long one, and Col. Graham leads his men with a very good 44 in the 50.

WASHINGTON, D. C.—The Columbia Rifle Association kept up its series of season badge matches through holiday week. The day after Christmas was frosty and blustering in the extreme, and low scores were made, not high enough to count on the series. Saturday, the 27th ultimo, the short and long range matches were more satisfactory, Mr. Laird making a good 47 at 200 yards and 37 at 300 yards, while Colonel Burnside pulled together a cheering 211 in the face of a strong wind.

The scores were as follows:—

C. H. LAIRD.

200 yards	4	5	5	5	4	5	5	4	5	5	—47
300 yards	4	4	3	3	5	3	5	3	4	3	—37—84

CAPT. CHAMBERS.

200 yards	4	4	4	4	5	5	4	5	4	5	—44
300 yards	3	3	3	5	3	4	3	4	4	3	—35—79

COLONEL BURNSIDE

800 yards	3	5	5	3	5	5	5	4	5	5	5	4	5	5—69
900 yards	5	5	5	5	5	5	5	5	5	5	5	4	5	5—72
1,000 yards	5	4	5	5	5	5	5	5	4	5	5	3	5	4—70—211

P. J. LAURITZEN.

800 yards	5	5	5	5	4	5	5	5	5	5	5	3	5	5—72
900 yards	5	5	3	5	5	3	5	5	5	4	5	4	5	5—71
1,000 yards	3	5	5	3	5	3	4	5	5	5	4	5	5	5—65—208

DR. S. I. SCOTT.

800 yards	4	4	4	5	5	5	5	5	5	5	5	5	5	5—72
900 yards	4	2	3	5	5	5	5	5	5	4	0	5	5	5—63
1,000 yards	5	5	5	3	4	4	5	5	5	5	5	5	4	5—70—205

On Monday, the 29th ultimo, notwithstanding the delightful day, only eight marksmen faced the butt. The light was tricky, and pulled down the off-hand scores especially, much more than the normal high winds at Benning's are apt to do. At long range, however, the slight haze did not seem to interfere materially with the comfort of the shootists. The gentle puffs that danced over the marshes scarcely moved the great vane, which still pointed to 9 o'clock, as if in memory of Saturday's gale. Mr. Lauritzen piled up a clean score at 900 yards, and Colonel Burnside very nearly did the same; these

To going back to the last stage with 148 and 146 to their credit respectively. Dr. Scott was breaking in a new prize gun which, although fairly tractable on being sighted for elevations two days before, now distinguished itself at first appearance in a match by unruliness of temper of a most deplorable kind. The scores for the day's shooting were as follows :—

	200.	300.	Tl.		200.	300.	Tl.
C. H. Laird	41	39	80	H. H. Miller	42	34	76
J. B. Burnside	42	38	80	A. A. Adee (military rifle)*	40	33	76
Capt. B. Chambers	41	37	78				

*Allowance 3.

COL. J. O. P. BURNSIDE.

800 yards	5	5	5	5	5	5	5	5	5	4	5	5	5	5	5	4–73	
900 yards	5	5	5	4	5	5	5	5	5	5	5	5	5	5	5	4–73	
1,000 yards	5	4	4	5	5	5	5	5	5	5	5	5	5	5	5	5–73–219	

P. J. LAURITZEN.

800 yards	5	4	5	5	5	5	5	5	5	5	5	5	4	5	5–73		
900 yards	5	5	5	5	5	5	5	5	5	5	5	5	5	5	5–75		
1,000 yards	5	5	4	4	5	5	5	4	5	5	3	5	5	4	5–69–217		

DR. S. I. SCOTT.

800 yards	5	5	4	4	5	5	0	3	5	5	5	5	5	5	3–64		
900 yards	3	3	3	5	4	3	4	5	5	0	5	4	5	5	5–59		
1,000 yards	4	0	5	3	3	5	5	0	4	3	0	5	5		withdrew.		

Colonel Burnside heads the contestants for the badge thus far, his three highest scores being 213, 216 and 219, aggregating 648, the same total with which he won the Harkness gold medal. Mr. Lauritzen comes next in order. A. A. ADEE.

WEST VIRGINIA.—*Wheeling, Dec. 25th.*—The shooting tournament which was announced by the Wheeling Rifle Club to be held on their range on Christmas was largely attended by riflemen from the city and neighboring towns. The day was quite stormy, and the fast falling snow rendered the bull's-eye very indistinct. The new house lately put up on the range by the club affords good shelter, and as the firing is done through a sliding window it does not matter whether it storms or not. Prof. C. E. Dwight carried off the honors of the day, winning first prize in three of the four matches in which he shot. The Massachusetts target was used, bull's-eye eight inches in diameter with a four inch center, the latter counting twelve, and remainder of bull's-eye eleven, and this down to two by rings two and one-fourth inches apart. The whole target being four feet by six. The shooting was all at two hundred yards and off-hand. The leading scores were :—

First Match.—Amateur's championship match for club members only :—

Babcock	10	7	9	14	11–48	Coe	9	9	7	10	4–39						
Jeager	9	7	8	7	10–41	Clark	9	2	9	6	7–33						

Second Match.—All comers :—

Babcock	8	7	12	9	9–45												

OHIO—*Cincinnati.*—The following is the score made by the Cincinnati Shooting and Fishing Club, at Trimpe's Range, in the fourth competition for the Baker Medal. Messrs. Weston, Caldwell, Fender and Gindelin in this match shot against Messrs. Baum, Henson, Topf and Hall, the stakes being a game supper for the club ; the conditions of the match being that the score made in the medal match should count for both. As will be seen, Weston's side won by a score of 574 points against 549 points made by Baum's. Distance, 200 yards, off-hand:—

																	Mass. Creed.
W. Caldwell	10	9	10	9	10	11	8	11	10	9	12	10	10	9	10–148		63

Cincinnati, Jan. 3d.—At the benefit shoot held at Trimpe's Range last week, the following scores were made out of a possible 60 points ; re-entries allowed ; 200 yards : Massachusetts-Creedmoor target, those using a rest being confined to a target reduced for 50 yards :—J. R. Weston, off-hand, 55, a gold scarf-pin ; F. Weiserest, 54, a clock ; L. Fender, off-hand, 51, a razor ; Kastlehorn, rest, 51, box of cigars ; M. Gindelin, off-hand, 50, keg of powder ; G. Henson, off-hand, 50, muzzle-loading rifle ; Harmes, rest, 49, silver cup ; W. Caldwell, off-hand, 48, two hundred bullets ; F. Varmore, rest, 48, cap extractor ; W. Powell, off-hand, 47, a large pound cake ; — Don, rest, 45, cleaning rod ; J. A. Henochsberg, rest, 44 ; C. Kettler, rest, 32, won a small earthern vase, being special prize given for lowest score of the day. A large number of shooters were present.

Score made on the 28th inst. by the Cincinnati Shooting and Fishing Club, in their fifth competition for the Baker Medal ; 200 yards ; off-hand ; target, Massachusetts-Creedmoor :—

																	Mass. Creed.
M. Gindelin	10	10	6	11	10	9	9	11	9	10	12	12	11	10	9–144		64

C.

ILLINOIS—*Chicago*—The business boom has knocked the wind out of the rifle clubs hereabouts, and until the ethereal mildness of spring time there will not be any practice to speak of on the ranges. The galleries are too tame for us old cocks who can't see any fun in pop guns. LU.

LOUISIANA—*New Orleans, Dec. 21st,* 1879.—The ninth and final competition for the Inter-State Mobile Trophy was shot on the range at Frogmoor to-day between teams of the Washington and Louisiana Field Artillery. The conditions were teams of eight each, military rifles and rules, 200 and 500 yards, seven rounds at each range, with two sighting shots. The atmosphere was clear and bright, light good, and wind somewhat choppy. At the first distance both teams shot in good form, the average being almost centres per shot, but with Glynn's team two points in the lead—213 to the 211 of the Washingtons. As the afternoon advanced the light became bad, the wind strengthened, causing some of the most reliable to come to grief. At the close the Louisianas had gained ten more points, having had 209 to the 199 of the Washingtons, and thus winning by 12 points. Of the nine matches the Louisiana team won the first with 365 ; second, 396 ; third 345 ; seventh, 399 ; and ninth, 422 ; and the Washington team the fourth with 345 ; fifth, 363 ; sixth, 403 ; and eighth on 390. The following are the scores :—

LOUISIANA FIELD ARTILLERY.	200 Yds.	500 Yds.	Total.
Geschwind	32	29	61
Weiss	28	32	60
Bercegay	31	26	57
Fortier	22	33	55
Glynn	29	25	54
Salleau	27	24	51
Durel	20	24	44
Thompson	24	16	40
Grand total			442

WASHINGTON ARTILLERY.	200 Yds.	500 Yds.	Total.
Miller	30	28	58
Selph	25	32	57

Grand total			410

Game Bag and Gun.

GAME IN SEASON IN JANUARY.

Hares, brown and gray. Wild duck, geese, brant, etc.

FOR FLORIDA.

Deer, Wild Turkey, Woodcock, Quail, Snipe, Ducks, and Wild Fowl. "Bay birds" generally, including various species of plover, sand piper, snipe, curlew, oyster-catcher, surf birds, phalaropes, avocets, etc., coming under the group *Limicolæ* or Shore Birds.

GAME AND FISH DIRECTORY.

In sending reports for the FOREST AND STREAM Directory to Game and Fish Resorts, our correspondents are requested to give the following particulars, with such other information as they may deem of value ; State, Town, County ; means of access ; Hotel and other accommodations ; Game and its Season ; Fish and its Season: Boats, Guides, etc.; Name of person to address ;— after the following model :—NEW YORK, *Bay Shore*, Suffolk County, Long Island. Reached by Long Island Railroad, forty miles from Hunter's Point. Hotel—Prospect House, John S. Rogers, proprietor. $12 per week. *Game*—Ducks of all varieties and geese, October 1st to May 1st ; bay birds, after July 10th ; quail, November 1st to January 1st. *Fish*—Bluefish, June 1st to November 1st ; sea bass, kingfish, porgies, and sheepshead, all summer. Boats, $3 per day. Address, John S. Rogers, as above.

PATTERN TESTS.

It is impossible to fix upon any one pattern as a standard by which to guage the shooting qualities of individual guns, because of so wide a diversity in the degree of choke. We have therefore selected the two extremes, a cylinder bore and a very full chokebore, and give below such patterns as good guns of each class should make. Between the two limits of 110 for cylinder and 240 for extreme choke most of our readers will probably find their records to accord with the divergence of their guns from these two bores.

A cylinder bore gun loaded with 1¼ oz. No. 7 shot should put 110 pellets into a 30-inch circle at 40 yards.

An extreme choke bore gun, loaded with 1¼ oz. of No. 7 shot should put 240 pellets into a 30-inch circle at 40 yards.

A good choke bore, such as we prefer for general shooting, should put between 180 and 200 pellets into the same circle under the same conditions. There is a golden mean in pattern. While a gun that drives its shot packed like a bullet requires sure aim, and a big score with it counts more than with a scattering chamber, the game is terribly mutilated and butchered.

The patterns given above are with the following charges of powder :—

TWELVE BORE.	TEN BORE.
6¼ lbs. to 7 lbs.	2¼ dr. to 3 dr.
7 lbs. to 7¼ lbs.	3 dr. to 3¼ dr.
7¼ lbs. to 8½ lbs.	3¼ dr. to 4 dr.
7½ lbs. to 8 lbs.	3½ dr. to 4 dr.
8 lbs. to 8½ lbs.	3¾ dr. to 4 dr.
8½ lbs. to 9 lbs.	4 dr.
9 lbs. to 10½ lbs.	4 dr. to 5 dr.

—The New Jersey State Sportsman's Association will hold its annual meeting at Osborne's Hotel, Jersey City Heights, to-day at 1 P. M.

MICHIGAN VENISON.—It was before the first of January that we received from Mr. S. A. McLean, of Bay City, a saddle of venison from the Michigan woods, a trophy of Mr. McLean's skill with the rifle. May his arm never falter nor his aim be less true.

CHEAP GUNS.—We need hardly caution our readers against investing in the $4 guns now advertised so extensively. The man who puts his money into one of these arms puts it where he will never get any return for it. In buying a gun deal with first-class, reliable firms, and do not think to get a good arm for a song. The dealers in sportsmen's goods whose names are found in our columns are all reliable, and an order may be sent to them with perfect satisfaction. The cheap guns which are given away are either unsafe to handle or else they are old models for which no ammunition can be found.

—Mr. Henry C. Squires, who has advertised with us from the founding of this paper, assures us of his appreciation of FOREST AND STREAM as an advertising medium, and attributes much of his success in building up a business by which he is supplying the finest guns of foreign and domestic manufacture to leading sportsmen in every State in the Union, to the fact that he has appealed to this class through our columns. We understand that he is arranging for a largely increased trade in fine breech-loading guns during the coming year, and so gratifying has been the success of the Greener hammerless, that he has given orders for the building of 200, and will carry a full line in stock of all sizes and grades.

HUNTING THE WILD TURKEY.—The valuable paper on the "Origin of the Wild Turkey," contributed by Professor Elliott Coues to our last issue, is supplemented today by a sketch of turkey-hunting in Virginia. And here is a note from Indianapolis, Ind., under date of Dec. 30th, which shows that Virginia is by no means alone in her abundant supply of these game birds :—

Our winter is mild. Few quail have been taken, but I believe we have a goodly supply for next season's breeding. A few days since one of the men on my farm, thirty miles north of here, while hunting for wild turkeys found one hanging in a jungle of oak limbs, where several trees had been blown down, just at the edge of my corn field. It had evidently been flushed, and in its sudden flight had caught its neck and strangled to death. Three weeks since, near Spencer, this State, my brother killed a large wild gobbler which came from the woods into his barnyard to visit his tame turkeys. It weighed twenty pounds, and the beard was eight inches long.

THE FLORIDA PARTY.—If four men do not enjoy the next two months it will not be from a lack of fine country or pleasant companionship. We have the following advices from the Florida party recently made up through ourselves. The letter is dated at Cedar Keys, Dec. 29, 1879 :—

We leave Cedar Keys to-morrow for a trip down the Gulf coast as far as Ten Thousand Islands. Have chartered the sloop *Sam Johnson*, owned by Mr. E. Faber, the great lead-pencil maker. He owns a large cedar mill here, running day and night for the supply of his pencil trade. Our outfit is said to be the best ever having left Cedar Keys. Our party consists of Dr. A. Ferber, W. L. Brooks and H. H. Benedict, of New York ; Thos. C. Steel, of Philadelphia ; a pilot, a cook, and our setter dog, Tom. We will be gone two months and anticipate a good time. We have a valuable addition to our party in Dr. Ferber, who being an M.D. can administer to our wants in case of sickness. Our mail point is at "Punta Rassa," where we get the mail but twice while on our trip.

T. C. STEEL.

NEW HAMPSHIRE—*Nashua, Jan. 1st,* 1880.—Our record for the past year shows that while fishermen have had more than good luck, hunters have had poorer than usual. Trout fishermen brought in magnificent strings the past summer, pound and pound and a half fish were frequently exhibited by successful anglers. I do not hesitate to give our fish laws full credit for the showing ; the law is respected in this vicinity—that is to say, as much as any law—and we are a law-abiding people. Woodcock shooting has not been good, only a few good bags have been brought in. Ruffed grouse have been scarce. Snares have caught thousands from Hillsborough county alone within the past few years. We have now a stringent law against snaring, and judging from the scarcity of snares on the partridge ground the past fall, the exterminators of this noble game bird have given up their nefarious business, at least for a season.

Pickerel fishing through the ice has commenced in good earnest. Good luck has been the rule ; five hundred weight or more have been taken within the past fortnight by the lucky ones. Fox and rabbit hunting is now in order. Reynard is successful, as usual, in giving the boys the "go-by," but half a dozen this year's brushes attest that he has lost so many of his uncles or his aunts through the skill of some of our friends.

WEBB.

THE BEAVER RIVER CLUB.—*Springfield, Mass., Dec. 30th,* 1879.—The sixth annual re-union and supper of the Beaver River Club will be held at E. C. Barr's, Springfield, Mass., Jan. 16th. FRANK BOLLES, JR., Sec.

FOXES AND QUAIL.—*Aslfield, Mass., Dec.* 22d, 1879.—Foxes are increasing to such an extent in this section that unless something is done to check them they will materially lessen the "bird crop." I have been shooting grouse and woodcock constantly since Sept. 1st with fair success, and have not found a single tick. But judging from the piles of feathers I came across, old Reynard is getting more than his share, and I hope our law-makers at the "Hub" will not fail to pass a law offering a generous bounty for the scalps of such game-destroying "varmints." Hares are fairly plenty, and mink, muskrat, etc., unusually so. I think there are grouse enough left for a fair stock for another year if the foxes let them alone. RUFF.

CONNECTICUT—*Granby, Jan. 5th.*—The great northern hare, or white rabbit, is very abundant a few miles from here, and last Friday my pack of English hare beagles ran one several hours, when I ended the chase by shooting the hare. A. E.

NEW JERSEY—*Beverly, Dec. 27th,* 1879.—New Jersey people respect their game laws and observe them as much as any other State, consequently we find good shooting. Most of the farmers post their lands, but a polite request is as politely granted. More than the usual number of quail are left over for another year, especially "down in the pines," where the cover affords them better protection. Cover did I say? I mean the "cripple," or the "spung." That's where the native Jerseyman hunts for quail. We found several coveys of quail in the "Big Gum Spung." Christmas day we bagged several woodcock, one weighing nine ounces. Seven and eight ounces are very common at this late season. To see these fat noble birds ought to extinguish any desire one may have to shoot the poor little things in July and August. May their numbers increase. But we hope and pray in vain, unless the close time is extended. DOWN-EASTER.

KENTUCKY—*Owensburg, Dec. 24th*, 1879.—The organization of a shooting club is being earnestly discussed by the leading sportsmen of this city. It is a sensible move and one in the right direction. Mansfield Martin, a citizan of Murray's Precinct, aged 81 years, killed a hawk recently with a rifle, out of the top of a tall hickory tree, being at the distance of 100 yards from the tree at the time of firing. Darien County is not exactly the garden of the gods, and yet, wild violets have been found blooming in the woods and fields here in the middle of December, while an old turkey here, at Jack Heads, near West Louisville, took advantage of the business boom in this section and hatched out sixteen young turkeys on the 19th inst. John Hancock captured an eagle in his corn field several days ago that measures eight feet from tip to tip.

The glass-ball shooting match that occurred in Griffith's Woods on Friday, Dec. 12th, 1879, resulted in the following scores; five balls each; 18 yards:—

No. 1. Charley Elder, 4; Dick White, 3; Claude Harris, 2; Clarence Boulware, 3; Seth Palmer, 4.

No. 2. C. Elder, 2; Dick White, 1; C. Boulware, 1; Seth Palmer, 2; C. Harris, 4; Allan Boyd, 4; first money divided by Harris and Boyd.

No. 3. C. Elder, 4; Dick White, 1; D. Vowels, 3; Claude Harris, 4; C. Boulware, 1; Seth Palmer, 2.

No. 4. Dick White, 1; Clarence Boulware, 2.

No. 5. White, 5; Boulware, 4.

No. 6. White, 1; Boulware, 4.

No. 7. Elder, 4; White, 3; Harris; Vowels, 1; Palmer, 2; Boulware, 5.

No. 8. Eight balls; Boulware, 2; Palmer, 5.

No. 9. Five balls: D. M. McHenry, 2; Palmer, 2.

Tie shot off; McHenry, 3; Palmer, 4; TENNESSEE.

ARKANSAS—*Jacksonport, Dec. 27th*, 1879.—The shooting prospects of this region were greatly injured by a long continued drought. Ducks and geese came on in force, but finding our lakes and sloughs dry, went on.

In Cache River bottom deer have been moderately plenty. Turkeys in reasonably full supply and well distributed. Only the chosen few, however, are able to feast upon birds of this species of their own killing. Coons and possums in abundance, and plenty of squirrels to fall back upon.

Virginia partridges, though known to be in unusual quantity, owing to the dry weather, it is thought, have been hard to find until quite lately. They seem now to have packed, after the manner of prairie chickens, and are found in very large droves, are very wild, and do not lie well to the dog. They have so far suffered no damage from severe weather, and if they continue to take care of themselves, as against the ravenous hunter, there will be a magnificent breeding stock left. So mote it be.

YELL.

WHERE ARE THE DUCKS?—*Willis, Tex., Dec. 30th*, 1879.—Always previous to this winter, when we had an abundant mast, we had plenty of ducks. We have this season the greatest abundance of mast and all other kinds of acorn, together with an abundance of wild rye along the margin of the San Jacinto River, yet but few ducks have visited us so far. Some friends and myself have made some good bags of mallard, wood-duck, and greenwing teal, yet all kinds are scarce. Some attribute it to the drought, all the ponds having dried up; but in the river and creeks there is plenty of running water. What ducks we do kill are extremely tat. We get 15 to 25 mallard to the gun, hunting along the banks of the river and creeks, which I consider the cream of duck hunting, when the day is cool and you have a good spaniel along and a good breech-loader, and a flock of greenheads from five to thirty in nearly every bend—the finest sportsman's duck on earth—the handsomest, gamiest of his tribe. Talk about your canvas-back, sprigtail, teal, red-head, etc., but of all the feathered tribe on land or in water, I think the mallard duck, and the manner and methods of hunting him, combined with his beauty, size, and elegance, and his excellence as a table fowl, render him the most attractive game bird in the world. C. L. J.

MICHIGAN—*Detroit, Jan. 3d.*—E. H. Gilman and Jno. E. Long, of this city, were out on a hunt three days last week, bagging 26 quail, 25 partridges, and 5 rabbits. Wm. McSweeney, of Frazer, Mich., formerly of this city, and Ed. H. Gillman, of this city, paid the feathery tribe of Her Majesty's domains a visit of two days this week, and bagged 21 partridges, 28 quail, and 3 wild turkeys. DRUID.

PROVOKING.—*Brooklyn, N.Y., Jan. 2d.*—An old friend of mine, and an excellent shot, writes me from the country describing his experience in shooting at a single solitary duck swimming in the "Old Pond." "After shooting deliberately at the duck eleven times, framing it closely with bullet holes, the bird deliberately arose and flew away unharmed and untouched. I never indeed, or 'hardly ever,' felt deliberately meaner and more sneakingly unwell in my life, and I immediatedly headed for home, avoiding everybody on the way, and crawled in." L. B. F. H.

KENTUCKY CAMP LIFE.

IN my recent account of a trip taken in April last down on Nolin River I promised, after saying I would go again, to give an account of the luck we had. I would hardly do so if it were not that I remember one of my old Professors saying, in lecturing on a certain operation, that statistics were not reliable, for only the successful cases were reported. If the operation killed, nothing was ever said or reported; therefore I take it that the failures in hunts and fishing are hushed up, and only those in which the writer himself was surprised by success are ever written up. Therefore I shall give you this, though I can claim neither success nor failure. I left here on Saturday, September 13th last, on the early train for Millwood, a station on the P. and E. R. R. 36 miles distant, and met the party with which I had arranged to go. There we prepared tent, provisions and all necessary camp equipage, and left before day Sunday morning for Nolin River in Edmonson County, with "Old Elvis" (colored) and his hounds. The point aimed at was eighteen miles away, over a mountain road or path that an Indian of the Cooper pattern would lose his way in traveling. After a walk and ride (principally walk) of the whole distance, we arrived at our destination at twelve o'clock; prepared a hasty dinner, pitched our tents, collected straw for bedding, putting baggage away, fixing eating table, etc. Right here let me say what I have found out in regard to that most important thing in camping, a good bed. I have slept on everything, from a pile of rotten wood to a camp lounge, and wished I was at home every night, until I had my better half make me what is known as a "tick," *i. e.*, a piece of bed-ticking sewed in shape of a matrass with a hole in one end to fill up by. Fill this with wheat or oat straw and lay it on a good straw foundation, and with a good tent and plenty of "kiver" you can defy the elements. No disparagement is intended to the camp lounges, but it is a standing joke with us old campaigners to allow the green-horns to rush off to bed first for the purpose of getting the lounge and then to have the laugh on them next morning.

Monday morning Old Elvis—the happiest darkey on earth—awoke the camp from a deep, peaceful rest with his old cow horn bugle that set the hounds a howling. A fresh bath in the clear waters of Nolin gave us new life and mastodon appetites. After breakfast Capt. W. called the roll and assigned each man to his duty for the day. We had been by appointment joined the evening we arrived by a party of three from Senora, Ky. This made the party eleven strong, not counting Old Elvis and our three dogs. A portion were detailed to drive for deer and the rest for fishing, and all left camp to rendezvous at noon. I was in the detail ordered down the river, and with a bucket of minnows and rigging footed it over "high bill and low dale" the longest one and a half miles I ever walked; up and down is not counted in that country. The river was in a low stage and, if possible, in bloom (as I see that is the latest excuse), consequently the nibbles were very few, but, as in all such cases, the excitement more intense. We fished some of the best looking pools I ever saw, changing minnows and using all the art we were capable of, but almost in vain, our efforts being rewarded at noon by a total string of six bass of medium size and a five pound catfish. Getting back to camp in time for dinner, we found the deer hunters had returned with worse luck than the fishermen. A good rest until four o'clock put us in the humor for another trial, and we selected the foot of the dam for the evening's fishing. Luck was again poor, and we early dropped into camp for supper. After supper came the usual flow of good humor, and jokes were cracked, pipes smoked, and the camp fire sent out its ruddy flame, lighting up the grand old trees in that peculiar weird and fascinating manner so dear to all of us who have experienced it. Ten o'clock found us all in bed preparing to go to sleep, when Tom G. alarmed us by announcing that a panther was prowling near the camp. Every man seized a gun and stood on the defensive. The fire burned low and the silence was awful. Soon a low, plaintive quivering cry was heard, causing half the crowd to shudder, the other half to burst into a fit of laughter, for it was the well known cry of the little screech owl. This event kept us awake and up until one in the morning, when we were more successful in wooing the drowsy god.

Daylight, Tuesday, found us around the breakfast table in a cloud of steam from the coffee boiler and hot rasher of breakfast bacon. Pretty much the same work was laid out for us as on Monday, and as far as fishing went pretty much the same success. However the hunters returned at an early hour with a spike buck as a bag, and great at an early hour with a spike buck as a bag, and great at an early hour with a spike buck as a bag, and great rejoicing followed, for we had begun to fear that our trip would be a failure. To make this long story short, I will say that we remained until Friday morning, having a fair share of success in fishing and lots of fun in driving deer, as one or two were started every day, but they seemed to know where the new hands were stationed, and invariably run through their stands, consequently we got no more. But the one we had gave us all the meat we wanted and a saddle to carry home. The same can be said as to the fish, for we ate all we wanted and carried some home. The country is extremely rough and rugged, and some of the people are the reverse of hospitable; but we treated them well and I think won over the most of them. It is a great country for "moonshine," and they look on every one with great suspicion, being always on the lookout for revenue officers. A. W. M.

Elizabethtown, Dec. 13th, 1879.

SHOOTING MATCHES.

NEW YORK CITY—*Jan. 1st.*—Match at pigeons; 25 yards rise; 80 yards boundary; Hurlingham rules; sweepstakes:—

A. H. Brown	1 2 0 1—3	S. W. Johnson	1 0 0 0 1—2
Will Herring	1 0 1 1 1—4	J. K. Taylor	0 1 0 1 1—3
Harry Pitt	1 1 1 1 0—4		

Herring and Pitt divided.

In shooting off tie Tay.or won, killing 1 and missing 1; Brown missing 2.

Second sweepstakes:—

Anderson	1 0 0 0 0—1	Grain	0 1 1 1 1—4
A. H. Brown	0 1 1 1 1—4	Taylor	1 1 0 1 0—3
S. W. Johnson	0 1 1 1 0—3	Will Herring	0 1 1 1 1—4
Harry Pitt	1 1 1 1 1—5		

Ties shot off—Brown, 10; Herring, 10; Grain, 11.

Third sweepstakes:—

A. H. Brown	0 1 1 1 1 0 1 0 1 0—6
Taylor	1 1 1 0 0 1 0 1 0 1—6
Harry Pitt	1 1 0 1 1 1 1 1 1 0—8
S. W. Johnson	1 1 0 1 1 0 0 1 1 1—8
Grain	0 1 1 0 1 1 1 0 1 1—7

Ties shot off, miss and out:—Taylor, 0; A. H. Brown, 1 1 0 0 0; L. W. Johnson, 1 1 0 0 1.

LONG ISLAND—*Brown's Driving Park, Jan. 1st.*—The following match was shot for satisfaction, "etc.," New Year's Day afternoon. The birds flew wild and had to be hit hard; 25 birds each; 5 traps; 3 yards apart; handicap rise; 80 yards boundary; 15 ounce shot; American Hurlingham rules.—

Allan Nichols, 28 yards	21	4	25
W. R. Henderson, 25 yards	17	8	25
George Henderson, 25 yards	17	8	25

Mr. George Henderson won in shooting off the tie, killing three birds straight; Mr. W. R. Henderson missing his third bird. Referee—Mr. Leonard Brown. Manager—Elvert Brown.

NEW JERSEY—*Saturday, Jan. 3d.*—A fifty-bird match between Messrs. M. D. Slocum and Walter Dayton was shot at Farmingdale, N. J. The conditions were 21 yards rise, single barrel, H. and T. traps. Slocum killed 40 and Dayton 37 birds.

Messrs. L. Benjamin and D. Thomas, both of New York, shot a pigeon match at Long Branch. The conditions were 25 birds each, 25 yards rise, two traps, each to find trap and handle, Long Island rules, $50 a side. Thomas won by a score of 21 to 20.

Members of the Middlesex, Amboy and Rahway pigeon clubs held a number of events at Tremley Shooting Park. The most interesting match was a competition for a handsome pigeon gun. The conditions were 10 birds each, handicap rise, Hurlingham rules. Mr. William Burnett, of Amboy, carried off the trophy, shooting off a tie of 9 with Dr. Mott, of New York.

A pigeon match came off at New Brunswick, N. J., between Messrs. U. C. John-on and Gustave Granger. The match was for $100 a side, 50 birds each; find, trap and handle for each other. H. and T. traps, single barrel. Johnson won by killing 39; Granger, 37.

Some "sweep" shooting took place for purses at Bayonne, N. J., the first being between Messrs. Fits, Woods and Ingalish. The conditions were 3 birds each, two traps, handicap rise, single barrels. The first round ended in a tie. The shoot-off resulted in favor of Fits. In another sweep of three, with the same conditions, the first two were find, Ingalish, who killed all three, the second money, after the shoot-off of a tie, went to Mr. Johnson. In a bird about sweep, first miss out, the first share of the stakes went to Mr. Childers on 7 birds; Mr. Fits took second money and Mr. English third.

Newark, Jan. 5th.—Shoot on New Year's Day: 15 glass balls; 18 yards; Bogardus' trap; left, right and away:—

Wmans	1 0 1 1 1 1 1 1 1 1 1 1 1—13		
Speer	0 1 1 1 0 1 1 1 1 1 1 0 0 1 0—10		
Wooden	1 0 0 1 0 1 1 1 1 1 0 0 0 0 0—7		
Mulford	0 1 0 1 1 1 0 0 0 0 0 0 1 0 0—5		
Holden	0 0 0 0 1 0 0 0 1 0 0 1 0 0 0—3		
Rawley	0 0 0 0 0 0 0 0 0 0 1 1 0 0—2		

H. E. W.

Rutherford Park, Dec. 25th.—Match of the Gun and Fishing Club. Pigeons; 21 yards; 1¼ ounce shot; club rules:—

Glastaeter	1 1 0 0 0—2	Lane	0 1 1 1 1—4
Coe	0 1 1 0 1—3	J. Vreeland	1 0 0 0 0—1
Van Roden	0 0 0 0 1—1	Wood	1 0 0 0 0—1
Jeaneret	0 0 1 1 —2		

Second match; glass balls: 15 yards; club rules:—

Glastaeter	1 0 1 1 0—3	Lane	0 0 1 0 1—2
Coe	0 0 1 0 0—1	J. L. Vreeland, jr	1 1 1 1 1—5
Van Roden	0 0 1 0 1—2	Wood	1 0 1 0 1—3
Jeaneret	0 1 1 0 1—3		

—The Essex Society for the Protection of Game will hold its regular monthly shoot at Erb's, Bloomfield road, Newark, N. J., on the 18th.

PENNSYLVANIA—*Applebachsville, Jan. 1st.*—Match between the sportsmen of Quakertown and Applebachsville; shooting for turkeys and wild geese; 21 yards rise; glass balls:—

Owen Kramer	3 3 3 2 —11	S. T. Laubenstine	5 4 3 4 4 —20
Henry Headman	4 4 5 3 3 4—25	W. Sleifer	2 3 2 —7
Milton Earny	4 4 3 5 3 2 21	Lewis Ahern	—1

Champion match between Earny and Headman:—Earny missed his 18th, and Headman broke 18. S. F. S.

FLORIDA—*Jacksonville, Jan. 1st.*—Colonel C. A. Loud and A. Frenchy Johnson, of Boston, had a glass-ball shoot to-day under the rules of the Jacksonville Gun Club, at 100 glass balls, from a rotary trap. The scores ran as follows:—

Colonel C. A. Loud	5 5 5 5 5 5 4 5 5 5 5 5 5 5 5 5 5 5 5 5	5—49 5—98
A. Frenchy Johnson	5 5 5 5 5 4 5 5 5 5 4 5 5 5 5 5 5 5 5 5	5—49 5—97

GLASS-BALL SHOOTING.—*New York, January 5th.*—*Editor Forest and Stream:*—I want to say a few words in regard to glass-ball shooting. As I was the first man to invent a trap to throw a ball so as to afford good practice, was the means of placing this popular mode of wing practice before the public, I believe I can justly put forth advice without being accused of egotism or improper motives, simply because I sell glass balls or traps.

What I would say is for the benefit of shooters generally, being the honest conclusions I have arrived at after considerable experience in the field and before the trap. The average shooter will practice at glass balls, in order to fit himself for practical shooting in the field; therefore it is sufficiency in the field will depend very much upon the style of glass-ball practice he adopted. I am still convinced that, for practical purposes, there exists at present no better system of glass-ball practice than that which I first put before the public, that shooting from three traps, placed on yards apart, the centre trap to throw the ball straight away, and the two outside traps to throw a quarter ball across the line of the central trap, at about fifteen yards behind that trap. One advantage of this setting of the traps, is that the broken glass falls within a certain space, and can be more easily cleaned from the ground. The reason why I have continued to make and place my traps so as to throw balls as I explained it, is that I hunted for many years in the field for market, and I know that nine birds out of ten raised will fly straight back or present a quarter shot; and if in actual ball practice all clubs will follow my advice, and not be led astray by fancy and impracticable ideas, they will shoot glass balls from my traps, and according to my rules based upon extended experience, which will afford them more genuine practice than any other, besides having the desirable effect of establishing a standard trap, and setting thereof, rules and ball, for all contests and practice, which would result in the greatest good to the greatest number.

A trap for the glass ball is now established at the shooter, in actual practice at wing shooting. I am now about to manufacture my own traps and glass balls, and it shall be my special care that my traps shall be made reliable and serviceable; and in order to establish glass-ball shooting as it ought to be, where clubs wish three of my traps, I am prepared to furnish them at a discount.

My rough surface glass ball is certainly the best ball in the market for all purposes. The smooth ball to break, when hit by shot, must be made so thin that it invariably breaks upon the ground, is shattered in the trap, and hundreds are broken in shipping. My rough ball is strong for shipping, does not break in the trap, nor upon the ground, while it is sure to break when hit in the air by shot.

Shooters will therefore find the rough surface ball more economical even at cost of one or two dollars per thousand more than the smooth ball. I have perfected arrangements to manufacture my own balls, and will place them in the market at a price which makes them come cheaper for club use than any other now offered. I will establish a depot for the sale of traps and balls under my personal direction, and respectfully refer clubs and others interested, to my regular advertisement as to price and my future address. A. H. BOGARDUS.

Archery.

NOTES FROM ILLINOIS.

THE year just closed has seen the "Rational Pastime"—archery—grow from its infancy, in our country, to vigorous youth; and ere another twelvemonth passes it will have arrived at early manhood. The year 1879 must always be a memorable one in the annals of our favorite sport. A great number of new clubs were formed, several State tournaments held, and the first meetings of the National and Eastern Archery Associations will certainly be long remembered. Then the interest in archery shown by the FOREST AND STREAM and its correspondents must date from the last year. The discussion of the relative merits of American and English bows still continues, and as one correspondent has remarked, probably no one has been converted. And argument will not do it. All the printers' ink in the land will not convince an archer that one bow is better than another. Unless a novice he will only judge of the worth of a bow by a thorough use of it. The best bow is not simply the one which will last longest and carry farthest. A steel bow might be made to last a life time, and a sixty pound bow will undoubtedly carry farther than one of forty pounds made from the same material. Yet no one would think of using either. That is the best bow which is powerful enough to do the work required of it and does it with the greatest ease to the shooter.

The 100 yard range may be easily shot with a yew bow of so few pounds pull that there will be almost no perceptable recoil; whereas a hard wood bow powerful enough to command the distance with any reasonable levation would have a very decided recoil. And though

n archer equally acquainted with the two bows might r a time score as well with one as the other, his advancement would certainly be more rapid with that bow which caused the less expenditure of physical force.

And if there is any bow of the same cost, of the same pull, and of slight recoil, that will carry an arrow with as low a flight as a yew, we have yet to see it, or hear of it (we know nothing of the celebrated rawhide bow). And, as I have said several times before, the Highland Park archers believe there is no bow like an Aldred. Perhaps we are prejudiced! But we know a host of the best archers in the country have the same way of thinking; and one of them has recently received a letter from Major Fisher, of England, in which he gives his preference for Aldred's goods. Our experience has been that Aldred's bows not only shoot better than any other, but wear better. Mr. Hall had one break, after it had done long service. Dr. Weston had an English yew which began to pinch; without waiting for it to break, he had one half of his bow and the unbroken half of Mr. Hall's put together by Spalding Brothers, of Chicago. We do not believe there is a bow in the country which has shot a greater number of arrows than the Doctor's, and the bow is as perfect and shoots as strong as ever. Mr. Kyle has a beautiful Aldred Spanish yew, which has been owned by three different members of our club, and shot thousands of arrows, and is still a perfect bow. Mr. Carver has never broken an Aldred yew, though he has been trying to. For some months he has been using a 5 feet 6 inches, 28 pounds, ladies' bow, with a 28-inch arrow, doing his best shooting, and without injury to the bow. With this light bow he scored at 100 yards 72 arrows, 33 hits, 113 score. We believe no bow of the same pull, save a yew, could have done the same work.

American dealers in English archery have made a great mistake in charging from 35 to 50 per cent. more than they should have done for their goods. We import our goods directly from Aldred, Mr. Carver kindly acting as agent for us, and charging nothing for his trouble. In this way we save at least 25 per cent. on arrows, and 50 per cent. on bows. For $20 we can get as fine and durable a Spanish yew as one would wish, and a better one than can be bought here for $40. If your wish a better bow for half your money, do your own importing.

Since the national meeting in Chicago our archers have improved very fast, and chiefly for two reasons—they do not shoot half as much, and use from ten to twenty pounds lighter bows. Don't shoot too often nor too many arrows in a day, and a 40lb. yew bow is heavy enough for any man.

The advancement which archers make in their second season's practice is much greater than they will ever make in any one year after. Last year only three members of our club scored over 100 with 30 arrows at 60 yards. Two made 102 and one made as high as 147. This year the following scores have been made:—

W. B. D. Gray	29—165	E. B. Weston	28—160
Ford P. Hall	28—164	H. C. Carver	29—159
O. W. Kyle	28—162	E. H. Beebe	28—152

Since the commencement of winter the following scores have been made—the 60 yard shooting this week with snow covering the ground and the mercury below freezing:—

AMERICAN ROUND.

	—40 Yds.—		—50 Yds.—		—60 Yds.—		—Total.—	
Dr. Weston	30	174	28	148	28	150	86	472
Mr. Gray	30	190	29	151	26	122	85	463

144 arrows at 60 yards:—

	1st 24.		2d 24.		3d 24.		4th 24.		5th 24.		6th 24.	
Dr. Weston	24	108	22	130	19	85	22	102	19	95	20	80
Mr. Gray	19	93	20	84	23	103	21	87	22	100	20	90

Who will join the Winter Practice Club?

Already we begin to think of the next grand annual meeting of the National Association. We believe it is the wish of every member of our club to shoot no more "American Rounds" at the grand annual meetings. By all means continue the team shoot, but let it be at 60 yards, or at 60 and 80.

We understand there is to be a meeting of the National Association in Chicago on the 28th inst., and we urge all clubs to send representatives. The place and time of holding the next grand annual meeting are to be decided, and other arrangements made. N. K. D.

CHICAGO.—The following scores were made at the Exposition Building Jan. 1st; 30 arrows; 60 yards:—

	Hits.	Score.		Hits.	Score.
H. C. Carver	29	147	S. B. Eagan	22	101
	28	159		20	107
	30	174		26	127

NEW YORK ARCHERY CLUB.—As noticed in our last issue, a team of this club visited the Ascham Archers of Brooklyn, E. D., at their hall, corner Division avenue and Clymer street, to shoot a friendly match, Dec. 30th, 1879. The hall being triangular, with the targets at the small end, they have the appearance of being at a greater distance than they actually are. The Ascham Club have experimented with lights to the best advantage, but will, without doubt, improve much upon the same more before long. Tuesday evening the Ascham team had their target, as usual, on an iron stand, while the New York team had their target suspended by ropes close to the butting. The New York team had visited the hall but once before for practice, and it was comparatively a new ground for them.

The shooting commenced shortly after 8 o'clock, and sixty arrows were shot. The New York team shooting much quicker than the others, finished their scores first. The bows used in the contest were of American make, and the New York team used the patent rawhide-backed bow, which is the favorite with them, the club using them altogether, with one or two exceptions. The following shows the record of the match; and while, perhaps, the scores are not high, it must be borne in mind that it was the first attempt of amateurs, and their first appearance in public:—

NEW YORK ARCHERY CLUB TEAM.

	Arrows.	Hits.	Scored.	Total.
Mrs. De Luna	30	24	106	
	30	29	100—	206
Miss E. T. Morton	30	21	89	
	30	28	114	203
John W. Sutton	30	30	152	
	30	30	150—	302
George D. Pond	30	23	105	
	30	23	117—	222
Dr. A. B. De Luna	30	23	91	
	30	25	99—	190
James W. Auten, Jr.	30	29	151	
	30	28	116—	267
Grand total				1,390

ASCHAM ARCHERY CLUB TEAM.

	Arrows.	Hits.	Scored.	Total.
Mrs. A Geyer	30	19	81	
	30	25	91	172
Miss Von der Luke	30	18	51	
	30	18	81	148
Mr. J. L. Chapman	30	28	170	
	30	28	154—	324
Mr. A. Geyer	30	24	110	
	34	20	136—	246
Mr. Joseph Marsh	30	26	116	
	30	30	130—	246
Mr. W. H. Robinson	32	18	98	
	30	23	87—	185
Grand total				1,321

The New York team thus won the match with 69 points to spare. It is expected that as soon as the New York Club obtain their hall for evening practice, a return match will be shot, and we may look for another splendid contest. Any of our readers desiring to witness the New York Archery Club shoot are welcome, Tuesday, Thursday and Saturday afternoons, at Excelsior Hall, corner Ninth avenue and Twenty-seventh street, where they are at present located, until a place can be obtained for the evening. The club met as usual at their hall Saturday, Jan. 3d, a large number of members and spectators being present. The weekly meetings seem to be attracting a greater number each week. What will be the result when they shoot in the evenings?

Yachting and Boating.

☞ *The time for electing officers for the ensuing year being now at hand, we request secretaries of yacht clubs to forward the new lists as soon as convenient.*

LIST OF RACES SAILED IN AMERICAN AND CANADIAN WATERS, 1879.

As this list is necessarily compiled from accounts published, it cannot be complete, but what omissions there may be are few in number and not of importance. The dates of two or three races, where the results have not been recorded, are inserted in the list. Again, several accounts only give the names of the winners, and not of the starters. This interferes with the completeness of this list; but what affects it more seriously is the practice of not putting in the accounts the number of prizes sailed for, merely numbering the boats in their order. In such cases only one prize in a class has been inserted in the list, and several second prize winners must have been omitted.

The following abbreviations are used:—1, 2, 4 after a boat's name signify first class, second, or fourth prize. 1st c., 2d c., etc., 1st class, 2d class, etc.; w. s. stands for "walk over;" entries signify actual starters; Y. C. stands for yacht club; and the following letters before Y. C. for the names of clubs:—Atb., Albany; A., Atlantic; Bat., Baltimore; B. Q., Bay of Quinte; B., Beverly; Bn., Boston; Bc., Brooklyn; Buf., Buffalo; B. H., Bunker Hill; C., Charleston Ice; Car., Carolina; Chi., Chicago; C., Columbia; C. P., Coopers Point; D., Dorchester; Dux., Duxbury; E., Eastern; E. B., East Boston; Emp., Empire; Hv., Haverhill; H. R., Hudson River; J. C., Jersey City; L. I., Long Island; L., Lynn; Mad., Madison; Mon., Montreal; N., Nahasset; N. Bd., New Bedford; N. H. I., New Hamburg Ice; N. J., New Jersey; N. Y., New York; New., Newburyport; O., Oceanic; Oc., Oconomowoc; Py., Pavonia; Ph., Philadelphia; P., Portland; P. L., Poughkeepsie Ice; Pros., Prospect Park; Prov., Provincetown; Q. C., Quaker City; Q., Quincy; R. C., Royal Canadian; Sav., Savannah; S. F., San Francisco; S. S., Sans Souci; S., Seawanhaka; S. C., South Camden; S. B., South Boston; south., Southwark; Tar., Tarrytown; W., Warwick; W. Y., Washington; W. L., West Lynn; W. B., West Brighton; Yon., Yonkers; R. N. S. Y. S. stands for Royal Nova Scotia Yacht Squadron; J. C., Jeffries Club; Clev. Y. A., Cleveland Yacht Association; Bat. S. C., Battery Sailing Club; J. C. C. C., Jersey City Canoe Club; N. Y. C. C., New York Canoe Club; S. B. M. F., South Boston Mosquito Fleet; S. S. M. F., South Salem Mosquito Fleet.

January 3, Prospect Park—P P and Capitoline I Y C Race, 5 entries, Mazeppa wins.

February 1, Poughkeepsie to New Hamburgh—N H I Y C Race, 4 entries, Comet wins.

February 3, Poughkeepsie—Match. Flying Cloud, N H I Y C, beats Icicle, P I Y C.

February 3, Trenton—Tr I Y C, 3 entries, Beach Prince wins.

February 8, Trenton—Tr I Y C, 2 entries, Beach Prince wins.

February 13, Poughkeepsie—P I Y C race for Ladies' Pennant. Hail wins.

February 13, New Hamburg—N H I Y C Race for Kidd Pennant. Flying Cloud wins.

February 13, New Hamburg—N H I Y C Owner's Race. Dart wins.

February 14, Poughkeepsie—N H and P I Y C Championship Race, 18 entries. Snow Bird wins.

February 15, Poughkeepsie—P I Y C Regatta, 10 entries, Gracie wins.

February 17, New Hamburg—N H I Y C Regatta for first class, 7 entries, Quickstep wins.

February 17, Poughkeepsie—Match. Comet, P I Y C, beats Sappho, of Athens.

May 3, South Boston—S B M F Regatta. C B's first class, 4 entries, Flora Lee wins 1st; Lizzie 2d; second class, 2 entries, Starlight 1st; Keels, 4 entries, Sadie 1; Winsome 2.

May 7, Savannah—Sav Y C Regatta. First class, 5 entries, Idaho 1; second class, 4 entries, Virgie 1; third class, 3 entries, Talluiah 1; Bateaux Round, 5 entries, Restless 1; Bateaux flat, 2 entries, Fat Tub 1.

May 12, South Camden—S C Y C Regatta. First class, 4 entries, McClees 1; second class, 2 entries, Anna 1; third class, 2 entries, Pooley 1.

May 12, Philadelphia—Match. J. H. Allen, Ph Y C, beats Wm. Douglass, South Y C.

May 12, Philadelphia—Match. Elmer W. Barr, C P Y C, beats Chas Cobill, C P Y C.

May 19, Hudson River—Match. Emma D., Empire Y C, beats Unknown, Empire Y C.

May 23, Portland—P Y C Regatta. First class, 2 entries, Viva wins; second class, schooners, 2 entries, Nellie wins; sloops, 3 entries, Twilight wins.

May 24, Quincy—Q Y C Regatta. First class, 2 entries, Waif 1, Folly 2; second class, 7 entries, Thisbie 1, Elf 2; third class, 7 entries, Rocket 1, Imp 2.

May 26, Southwark—South Y C Regatta. First class, 5 entries, Frank Lawrence 1, Maid 2; second class, 4 entries, Emma 1, Oliver 2; tuckups, 9 entries, Thomas Ledyard 1, Hugh Boyle 2.

May 26, Coopers Point—C P Y C, 12 entries, Espen Ashton, S C Y C, 1; Holland, C P Y C, 2 and Champion Pennant of club.

May 26, New Orleans—Southern Y C Regatta. Cabin sloops, 3 entries, No Name 1; first class, 5 entries, Albertine (Susie) S. 1; second class, 2 entries Xiphias 1; third class, 4 entries, Juniata 1; fourth class, 4 entries, Olivia 1.

May 28, New Orleans—Southern Y C Open Regatta. Cabin sloops, 2 entries, La Belle 1. First class, 4 entries, Lady Emma 1; second class, 2 entries, Puck 1; third class, 4 entries, Juniata 1; fourth class, 4 entries, Claire F 1.

May 28, Portland—Match. Marie, P Y C, beats Gracie, P Y C.

May 29, Cape Fear River—Carolina Y C Regatta, 5 entries, Rosa wins.

May 29 to 31, Portland—P Y C Cruise.

May 30, South Boston—D Y C Union Regatta. First class, schooners, 5 entries, Adrienne, Boston Y C, wins; second class, sloops, 5 entries, Siren Dux Y C wins; third class, sloops, 5 entries, Waif, D Y C, wins.

May 30, South Boston—S B Y C Union Regatta. Keels, first class, 4 entries, Gael, J C 1, Annie, S B Y C, 2; second class, 5 entries, all but one disabled; no race. C B's, first class, 1 entry, no race; second class, 7 entries, Thisbie, Q Y C, 1, Flyaway, Q Y C, 2; third class, 3 entries, Fancy, B Y C, 1, Sheila 2.

May 30, Jersey City—J C Y C Opening sail.

May 30, Staten Island—S Y C Opening sail.

May 30, New York—A Y C Opening Sail.

May 30, East River—Nereus Y C Regatta, 4 entries, Estelle wins prizes with and without allowance.

May 30, San Francisco—Match. Lively, S F Y C, beats Fawn, S F Y C.

June 2, Philadelphia—Sweepstakes for tuckups of Phil and South Y Cs, 16 entries, Crawford, Ph Y C, 1; Boyle, South Y C, 2; Mitchell, South Y C, 3.

June 2, Baltimore—Bal Y C Regatta. First class, 2 entries, both capsized; second class, 2 entries, Nat. C. Robinson 1; third class, 6 entries, Adeline 1.

June 3, Savannah—Sav Y C Cruise.

June 7, New York—Canoe Regatta, 10 entries, Elfin, N Y C C, 1; Louise 2; Clochette, N Y C C, 3.

June 7, Montreal—Mon Y C Opening sail.

June 9, Cape Fear—A Y C Regatta. Schooners, 3 entries, Peerless 1; cabin sloops, first class, 4 entries, Regina 1; second class, 6 entries, Winsom 1; third class, 2 entries, Nimbus 1; open sloops, first class, 2 entries, Pilot 1; second class, 2 entries, Wind 1.

June 9, North River—H R Y C Regatta. Sloops, first class, 2 entries, Adelaide 1; second class, Irene walk over; third class, 2 entries, Geo. B. Dean 1; fourth class, 6 entries, Joe Eagan 1; cats, 6 entries, Maria 1.

June 9, Cape Fear River—Carolina Y C Regatta, 6 entries, Frolic wins.

June 9, Quincy—Q Y C First Championship race. First class, 4 entries, Muriel 1; Folly 2; second class, 4 entries, Elf 1; Psyche 2; third class, 8 entries, Dandelion 1; Imp 2.

June 10, Salem—Salem Y C Regatta. First class, 4 entries, Mignon 1; second class, 4 entries, Dash 1; third class, 5 entries, Tulip 1.

June 10, Brooklyn—Bk Y C Regatta. Not sailed for want of entries.

June 11, Harlem River—Empire Y C Regatta. First class, cabin, 4 entries, H. W. Beecher 1; second class, open, 3 entries, Martha M. 1; third class, open, 3 entries, Mary Gibson 1; fourth class, open, 2 entries, Peter O Brien 1; catamarans, 2 entries, Tarentella 1.

June 11, New Orleans—Southern Y C Race for $1,000 Cup, 5 entries, Albertine (Susie S.) 1.

June 12, Philadelphia—Q Y C Regatta. First class, cabin sloops, 8 entries, Clara 1, Minerva 2, Comet 3; second class, cabin sloops, 5 entries, Lillie 1, Chris Gallagher 2, Stella 3; third class, open, 6 entries, Adelphi 1; Eddie 2; Bianca 3.

September 4, Nahant—Match. Psyche, B Y C, beats Mirage, B Y C.

September 5, Newport—Newport Y C Regatta, 6 entries, Dick 1, Ruby 2.

September 6, Toronto—R C Y C Open Regatta. First class, 6 entries, no race, buoy missing, postponed to September 8th; second class, 9 entries, Katie Gray 1, Emma 2, Gracie 3; third class, 14 entries, Fiona 1, Nellie 2, Wanderer, 3.

September 6, Geneva Lake—Race on, 7 entries, Geneva 1.

September 6, City Island—Race for cats, 6 entries, Estelle 1.

September 6, Boston—B n Y C Regatta. Second class, sloops, 4 entries, Viking 1, Lillie 2; second class, schooners, 2 entries, Leighton 1; third class, sloops, 6 entries, Rebie 1, Edith 2, Sunbeam 3.

September 6, Quincy—Q Y C Regatta. First class, 3 entries, Allie 1, Flyaway 2; second class, 3 entries, Wildfire 1; third class, 6 entries, Dolly Varden 1, Rocket 2, Undine 3.

September 6, Nahant—Match. Josie, B Y C, beats Nora, B Y C.

September 6, Mattapoisett—Race at. First class, 7 entries, Eleanor 1, Gipsy 2, Sprite 3; second class, 8 entries, Dot 1, Indeo 2, Ripple 3.

September 6, Mattapoisett—Match. Gipsy beats Sprite.

September 6, Cohasset—N Y C Regatta. First class, no entries; second class, 3 entries, Peri 1, Fancy 2; third class, 4 entries—the two prizes were taken by Psyche and Avis; but, owing to a confusion about firing starting gun, it is yet undecided which has first prize.

September 6, Cohasset—N Y C Race for Little Pennant. No entries; no race.

September 8, Detroit—Detroit Y C Regatta. Announced; no account. Probably not sailed.

September 8, New Orleans—Match. Zoe, Southern Y C, beats La Belle, Southern Y C.

September 8, Toronto—R C Y C Regatta. First class, 8 entries, Oriole 1, Enid 2, Cygnet 3.

September 8, Philadelphia—Sweepstakes for Ph and South Y C's. Alex. Crawford, Ph Y C, 1.

September 9, New York—C Y C Open Cat-boat Race, 8 entries, Jennie Dilks, W B Y C, 1.

September 9, Swampscott—E Y C Fall Regatta. Schooners, first class, 4 entries; second class, 2 entries; sloops, first class, 2 entries—in these classes no race was made in time—postponed to the 15th; third class, schooners, 3 entries, Sylph 1; second class, sloops, 4 entries, Shadow 1.

September 9, Swampscott—E Y C. Second attempt to sail handicap race. Final class, 5 entries, calm, no race in time—postponed to the 15th; second class, 4 entries, Sylph 1, Dream 2.

September 9, Fall River—Race for cats, 23 entries in all. First class, Hebe, of Newport, 1, Lookout, of Pawtuxet, 2, Glide, of Fall River, 3; second class, Gerbica, of Newport, 1, Rarus, of Providence, 2, Reindeer, of Newport, 3.

September 9, San Francisco—S F Y C Regatta. First class, 2 entries, Anhauser 1; second class, 2 entries, Clara 1.

September 10, Dorchester—D Y C sail off in fourth class. Rocket beats Nattie.

September 10, Cleveland—Cleve Y Asso Open Regatta, 9 entries, Vixen 1, Ida 2, Humming Bird 3, Unique 4, Lady Ida 5, Silver Spray 6.

September 11, New Orleans—Southern Y C Regatta for Challenge Cup. Cydnus beats Albertine (Susie S) and Litmnas.

September 11, Providence—Providence Y C Open Regatta for Cats. First class, 5 entries, Lookout of Pawtuxet 1, Hebe of Newport, 2; second class, 6 entries, Wilcox, War Y C, 1; Henry White 2; Rarus and Vision ruled out.

September 11, Nahant—Match. Psyche, B Y C, beats Josie, B Y C.

September 12, Salem—Salem Y C Third Championship Race. First class, centre-boards, 2 entries, Leona 1; second class, keels, 2 entries, Aurora 1.

September 13, Halifax—R N S Y S Regatta. First class, 2 entries, Petrel 1; second class, 4 entries, Psyche 1, Volante 3; third class, 2 entries, Mutai 1.

September 13, Chicago—Chi Y C Race announced, not sailed, too much wind.

September 13, Nahant—B Y C Fifty-first Regatta, third championship. Class 2, 2 entries, Nina 1; second class, 6 entries, Peri 1, Fancy 2, Peri takes pennant, tieing with Holden and Fancy; third class, 6 entries, Bessie 1, Psyche 2, Bessie takes pennant, tieing with Psyche and Nora.

September 13, Haverhill—Hv Y C Regatta. Five entries, Empress 1.

September 13, Geneva Lake—Race for Second Class. Three entries, Bonita 1.

September 15, Lansingburg—S S Y C Regatta. First class, 3 entries, Sans Souci 1; second class, 2 entries, Coquette 1; third class, 4 entries, Addie 1.

September 15, Swampscott—E Y C. Second attempt to sail autumn race. First class schooners, 3 entries; second class schooners, 2 entries; first class, sloop, 1 entry. No wind, no race, postponed to the 16th.

September 15, Swampscott—E Y C. Third attempt to sail handicap race in first class; 5 entries; no wind, no race, postponed to the 16th.

September 16, Swampscott—E Y C. Third attempt to sail autumn race, and fourth to sail handicap race; only 3 starters; wind again gave out; no race in time, postponed to 1880.

September 16, New York—N Y C Regatta. First class, Letitia, w o; second class, 3 entries, Dare Devil 1; third class, 3 entries, Dione 1.

September 17, New York—A Y C Regatta. Schooners, 2 entries, Peerless 1; first class, sloop, Dolphin, w o; second class, sloop, 2 entries, Lizzie L 1; cats, Wind only started, she upset.

September 18, South Boston—S B Y C. Open Regatta. First class, 3 entries, Lillie, E H Y C, 1; Annie, S B Y C, 2; second class, centre-boards, 3 entries, Allie, Q Y C, 1, Mamie, Dux Y C, 2; second class, keel, 9 entries, Banneret, W Y Y C, 1, Lena, E H Y C, 2; third class, 5 entries, Peri, B Y C, 1; Topsy, Prov Y C, 2.

September 18, New Bedford—N B Y C Regatta, 4 entries, Metric, 1.

September 18, Albany—Albany Y C Regatta. First class, 4 entries, Sans Souci 1, Artful Dodger, 2; second class, 2 entries, Coquette 1, Alban 2; third class, 5 entries, Aggie 1, Addie 2.

September 18, South Boston—Championship: no wind; Rocket, Q Y C, 1 on allowance; Fancy, B Y C, 2.

September 19, Cleveland—Cley Y Asso Regatta, 9 entries, Unique 1, Chimes 2, Silver Spray, 3, Gipsy 4.

September 19, Halifax—R N S Y S sail off to settle protest about second prize in race of June 21. Phantom beat Daphne.

September 20, Halifax—R N S Y S Handicap Race, 12 entries, Hebe 1, Ina 2.

September 20, Salisbury—Salisbury Y C Open Cat-boat Race, no account of number of entries. First class, Blanche 1, Clytie, 2; second class, Idolette 1, Alatus 2; third class, Francis 1, Keturah 2.

September 20, Dorchester—D Y C Open Race. First class, 5 entries, Siren, Dux, Y C 1; Viking, D Y C, 2; second class, centreboard, 3 entries, Eva, B Y C, 1; Mamie, Dux Y C, 2; second class, keels, 3 entries, Annie, S B Y C, 1; Gael, J C, 2; third class, keels, 9 entries, Veronica, S B Y C, 1, Empress, J C, 2; third class, centre-boards, 5 entries, Muriel, B Y C, 1; Fancy, B Y C, 2; fourth class, 8 entries, Rocket, Q Y C, 1; Nattie, Q Y C, 2; Helen, D Y C, 3.

September 20, Yonkers—Yonkers Y C Regatta. First class, 5 entries, Minnie, 1; second class, 2 entries, J. F. Garrison, 1; third class, Wiuema, 1.

September 22, Quincy—Q Y C Race for Nicholson Pennant, Nattie 1.

September 22, Philadelphia—Q C Y C Regatta announced, no account, probably not sailed.

September 23, Nahant—B Y C 52d Regatta. Sail off for championship in third class, open to Nora, Bessie and Psyche; 3 entries, Psyche 1.

September 23, New York—L I Y C Regatta. First class, 3 entries, Joe Saunders 1; second class, 2 entries, Rosy H 1.

September 23, Philadelphia—Ph and South Y C's Sweepstakes, 10 entries; T. Ledyard, South Y C, 1.

September 23, Belleville—B of Q Y C Open Regatta, 10-ton class, 8 entries; Kathleen, B of Q Y C, 1; Katie Gray, B of Q Y C, 2; Emma, B of Q Y C, 3; Surprise, B of Q Y C, 4; second class, 7 entries, Mystery of Kingston, 1; Widewake, B of Q Y C, 2; Mabel, B of Q Y C, 3; Amorette, B of Q Y C, 4.

September 24, New York—Empire Y C Regatta. Cabin sloops, 2 entries, Chester A. Arthur 1; open sloops, first class, Mary Keegan, w o; second class, 3 entries, T. W. Reeves, 1; third class, 2 entries, Sophia Emma 1.

September 25, Providence—Providence Y C Regatta for Anderson Cup, announced, but no account to be obtained.

September 25, Cleveland—Cley Y Asso Regatta. First class, 8 entries, Lizzie Warner, Hv Y C, 1; Empress, Hv Y C, 2; second class, 7 entries, Abbie M, Hv Y C, 1; Eclipse, Hv Y C, 2; Josie J, Hv Y C, 3; third class, 6 entries, Alatus, Salisbury Y C, 1; Psyche, New Y C, 2; Nora, Salisbury Y C, 3.

September 27, Boston—E B Y C Open Regatta. Schooners, 2 entries, O K, 1; keels, first class, 4 entries, Viking, D Y C, 1; Daisy, E B Y C, 2; second class, 8 entries, Veronica, S B Y C, 1; Dictator, S B Y C, 2; third class, 2 entries, Vanquard, W Y Y C, 1; centreboards, first class, 3 entries, Siren Dux Y C, 1; Lillie, S B Y C, 2; second class, 6 entries, Eva, B Y C, 1; Muriel, B Y C, 2; third class, 7 entries, Water Witch, S B Y C, 1; Peri, B Y C, 2.

September 27, Boston—B Y C Open Regatta. Schooners, 2 entries, Adrienne, Bn Y C, 1; sloops, first class, 3 entries, Siren, Dux Y C, 1; second class, centre-boards, 4 entries, Eureka, S. Boston, 1; second class, keels, 7 entries, Gael, J C, 1; third class, Muriel, B Y C.

September 30, S Boston—Match. Water Witch, S B Y C, beats Fancy, B Y C.

October 1, S Boston—B Y C 53d Regatta, sail off for championship schooners, open to Adrienne, Bessie and Peri; two latter started, Holden being laid up, Fancy won, Peri dismasted.

October 5, Bridesburg—Match. Hasse beats Pauline, both of Bridesburg.

October 5, Philadelphia—Match. T. Ledyard beats Sullivan, both of South Y C.

October 5, New York—Bat S C Race. First class, Robt. C. Poyater 1; second class, Richard Ganley 1; third class, L. P. McQuick and G. C. Kearney tie.

October 6, New York—Bat S C, Sail off of tie, D. P. McGuick 1.

October 16-18, Sandy Hook to Cape May and return—S Y C Sloop Race for Centre Cup, 14 entries, Mischief, S Y C, 1.

November 15, Lake George, Fla—Lake George Y C Regatta, 4 entries, Forest and Stream 1,

TRIED AND FOUND WANTING.

Edi[tor] Forest and Stream:—

In your last week's edition you speak of the recent experiments of Mr. Froude, which demonstrate that the density of water at say twenty feet is no greater than at say five feet. If this is so, it is certainly an important point in favor of deep-draught yachts, and I should be glad if you can refer me to any document or book where I can gain any information on this subject. I have been many years engaged in yachtsailing, and having tried catboats and centre-board sloop yachts of the prevailing flat-iron type I have for some time past come to the conclusion that such boats, are just fit for mill-pond sailing, and nothing else. At any rate I am discharged "cured" from that hospital, and am now having built a keel yacht, say 25 feet water-line, 28½ over all, and 5 feet draft, "cutter rig," 9 feet beam. On this question of draft I have had long discussions with my builder, who holds to the opinion that "the deeper the draft the more resistance," and it is only by hard work that I have been able to induce him to increase the draft and lessen the beam. Without knowing anything of Mr. Froude's experiments, I had some months ago rejected the prevailing opinion on that point, and shall be glad to have them corroborated. There remains one point which I have often discussed, i. e., iron on the keel. I stipulated for 1,500 pounds at least on the keel, but influenced by my builder's arguments have reduced the weight to 1,000 pounds, he claiming that while the extra 500 pounds would undoubtedly make the boat stiffer and enable her to carry more sail, still that she would not be so easy, would not "lift" so well in rough water. What have you to say on this point? MOGADORE.

As we propose during the winter to cover the whole ground of yacht design in a series of popular papers, our correspondent's patience must be taxed a while longer. For the present he is informed that draft of itself is not a factor of resistance at all, though it is commonly supposed to be such by popular acclamation, and in consequence of the erroneous teachings of the "old school" whose creed has been upset by more modern practical and theoretical investigations as yet little understood or appreciated on this side of the Atlantic. Resistance is due to "wave making"—traceable to form—to "friction" of wet skin and water and to "eddy resistance," this latter an item of no consequence in yachts with sharp cut-waters and chamfered stern-posts. Give your boat, therefore, all the draft you want, limit her wet surface by cutting away forefoot, and if necessary by raking the post; give her plenty of drag, so as to get the most effect out of the remaining longitudinal section by taking hold of fresh, solid water as the boat moves along; and give to the hull such form that no waste of power will take place in creating useless waves.

Concerning weight in keel, it is a bugbear and popular delusion to suppose that it interferes with "lifting" if you confine the weight as much amidships as possible. On the contrary, stretch your ballast fore and aft inside, and you do more to prevent "lifting" than by putting it in a solid lump on the keel, for the horizontal leverage of the ballast is greater when stowed inside. The five-ton cutter *Yolande* is as dry a boat as ever floated, and she carries four and a half tons of lead on her keel in 30 per cent. of her length, and not an ounce of ballast inside, except 300 pounds used for trimming. The "swing" of ballast on keel is not near as hurtful in a seaway as the long, horizontal leverage of inside pig. Draw a diagram and prove it to your own satisfaction. You will find Froude's experiments in the "Transactions Institute Naval Architects," in White's "Manual," and we believe in Kemp's "Yacht Design," also in several numbers of "Naval Science"—no longer published. Inquire of importers of English books.

BEVERLY YACHT CLUB.—*Editor Forest and Stream:*—I must take exceptions to one of "Rouge Croix's" statements in the last FOREST AND STREAM. Under date of July 4th, he says, "four yachts disabled and one capsized, was the record of the Beverly Yacht Club racing." The fact is, fifteen yachts started, and none capsized. By making this correction you will oblige,

W. LLOYD JEFFRIES, Com. B. Y. C.

Boston, Dec. 27th, 1879.

THE CAPE MAY RACE.—*Editor Forest and Stream:*—Permit me to correct a statement in your last issue regarding the *Blanche* in the Cape May race. The *Blanche* was entirely re-sparred, re-rigged, and had a new suit of sails, and was only put in the water the day before the race. We were not prepared for the extra strain consequent upon a one-third larger rig, and when at a critical moment in a heavy sea the bob-stay gave way, it was decided to put before the wind and make for home. It must be remembered that the *Blanche* had no chance of winning; that she only entered to make a race, and that she was within a mile of the lightship when the accident happened. She behaved admirably—reports to the contrary notwithstanding—and was dry and comfortable.

CHAS. H. GRUNDY.

It is well known that Mr. Grundy entered his *Blanche* to make up the list, and deserves this acknowledgement of his sportsmanlike spirit, especially considering the odds against him, no time being given by the larger vessels.

THE HENRIETTE.—The accident to this steam-yacht, before noticed, has turned out to be due entirely to one of those flaws in the material which it is next to impossible to prevent in a shaft, and which develops only upon actual use. The shaft was seven inches diameter, which is ample for a vessel of her size. Before would-be critics launch out in senseless tirades against builders, in irresponsible sheets, they would do well to find out how much the builders and designers are responsible for and to what extent the owner interferred with his petty crotchets about cabin fittings, etc. Ten to one they would find that the blame, if there be any, rests with the owner, who, with a liberal amount of arrogance, generally assumes to know more than experts, and in his self-complacency orders beams secured without knees or kneeplates "because they don't look nice in the cabin," and compels the builders to model and work in opposition to their experience and convictions. More than one failure has been laid to the doors of experts which should have been charged to the caprices of novices who may not know a jib hank from a tar pot.

COLUMBIA YACHT CLUB.—The annual ball of this club takes place Friday evening, Jan. 30th, at Lyric Hall, Sixth avenue. We acknowledge receipt of complimentary invitation.

UNION B. C.—The second annual reception of the U. B. C. takes place January 12th, at Lexington Avenue Opera House, Third avenue and Fifty-eighth street. A very pleasant time is anticipated by the many friends of the organization.

DEFERRED.—Much matter is necessarily deferred this week owing to the publication of our annual List of Races.

Cricket.

AVERAGES FOR 1879.

COLUMBIA CRICKET CLUB, OF HOBOKEN, N. J.

This young organization played five games, of which one was won and four lost. The following is from the official report:—

SUMMARY OF MATCHES.

Date and Place.	*Sides.*	*First Innings.*	*Second Innings.*	*Total.*
May 22, at Staten Island	Columbia	52	36	88
	Staten Island (2d).	45	37	82
Won by 7 wickets.				
June 19, at Prospect Park	Columbia	51	57	108
	Manhattan (2d)...	72	59	131
Lost by 23 runs.				
July 5, at Staten Island	Columbia	94	136 (7 w)	230
	Staten Island (2d).	202	—	202
Lost by 108 runs.				
August 7, at Hoboken.	Columbia	68	40	108
	St. George's (2d).	62	47	109
Lost by 1 run.				
October 2, at Hoboken.	Columbia	50	37	87
	St. George's (2d).	101	54	155
Lost by 68 runs.

THE RESULTS OF INTERNATIONAL MATCHES.—Six foreign teams have visited the United States and Canada; they have played forty-nine matches, of which they have won forty, lost but one, and had eight drawn. The annexed table tells the story:—

Year.	*Names of Foreign Teams.*	*Matches Played.*	*Against Sides of 22.*	*Against Sides Under 22.*	*Against Sides of 11.*	*Won.*	*Lost.*	*Drawn.*
1859	George Parrs' English Professional Eleven	5	5	0	0	5	0	0
1865	E. Willsher's English Professional Eleven	6	6	0	0	6	0	0
1872	Gentlemen of England	8	8	0	0	7	0	1
1873	Australian Eleven	6	6	2	1	4	0	2
1879	Richard Daft's English Professional Eleven	11	7	3	1	8	0	3
1879	Gentlemen of Ireland	13	0	8	5	10	*1	2
	Totals	49	29	13	7	40	*1	8

* Won by the Philadelphia Eleven.

Daft's Eleven, in addition to the above, defeated a team of eighteen selected base-ball players.

A scratch match was also played in 1879 between an eleven, including seven of Lord Harris' Australian team and an eleven of New York and Philadelphia players, which the foreigners won.

BOSTON ATHLETICS.—The Athletic Department of the Boston Driving and Athletic Association has been organized by the union of a number of gentlemen of that city who are interested in athletic sports. A suitable space has been secured at Beacon Park, where ample facilities will be afforded for cricket, base ball, foot ball, tennis, archery, and lacrosse, with a quarter-mile track for running and walking. The grounds allotted to each of these sports have been prepared after the most approved fashion, and the members are provided with club rooms, sleeping, bathing, and dressing rooms, and lockers. The plan promises to accomplish very much for the development of amateur athletics and is a most happy acquisition to the Hub. The President is Mr. Henry D. Russell; the Secretary, Mr. Henry W. Lamb, 33 Federal street.

—The Staten Island Cricket Club have made a skating rink of their ground, which reminds us of an old rustic epigram:—

"'Tis felony in man or woman,
To steal a goose from off a common;
But what must be that man's excuse
Who steals the common from the goose?"

—It is not improbable that the Staten Island Cricket Club will make a tour through Canada and the West during the coming season. A good week's cricket could be arranged as follows: Leaving New York on Saturday, play in Toronto, Monday and Tuesday; Hamilton, Wednesday and Thursday; and Detroit, Friday and Saturday. It is about time an Eastern club returned the visit of the Western cricketers. The St. Louis, Detroit, and Hamilton clubs have been to New York and Philadelphia, and as yet no Eastern club has gone West.

—Mr. C. W. Millward, the energetic Secretary of the Onondaga Cricket Club, is corresponding with the several clubs in Central New York, with a view to establishing a "Central New York Cricket League." The League to be comprised of the following clubs: Albany, Utica, Oswego, Oswego Falls, and Syracuse. Each club to play home and home matches, making a total of eight games for each club; the winner to hold the silver cup and pennant, awarded last season at the Syracuse Tournament, for one year.

—Mr. W. G. Grace's batting average for last season, in first-class matches, was 35.5. It was virtually the highest in England, although M. Riley claims 58.1, two innings played. Mr. Grace played in eighteen matches, including twenty-eight innings, scored 880 runs; top score, 128; contributed 166 in one match, and carried his bat three times. The next highest were: W. F. Forbes, 34.1; A. N. Hornby, 30.6; Hon. A. Lyttleton, 28.16; A. G. Steel, 27.13; Scotton, 27.4; Oscroft, 26.27; A. P. Lucas, 24.15; I. D. Walker, 23.16; Ulyett, 23.15; A. J. Webbe, 23.8; and H. Ross, 23.3.

Women's Column.

REBECCA'S FISH STORY.

"If, in a picture, Piso, you should see,
A handsome woman with a fish's tail,
Or a man's head upon a horse's neck,
Or limbs of beast, of the most different kinds,
Covered with feathers of all sorts of birds;
Would you not laugh, and think the painter mad?"

* * * * * * *

"Yet there are things improper for a scene,
Which men of judgment only will relate."

WERE I in San Francisco, in Bierstadt's studio, on Russian Hill, with the inspired artist's hand to guide the brush, I would not portray on canvas the scene I am about to present in verse, as blank as plain prose.

We will immediately repair to the great fishing grounds of North America, Puget Sound. Just at the hour, "when the sunbeams smite the water," the Indian goes forth to spear his favorite salmon. You will discern on the little bay in front of metropolis Seattle, fifty canoes or more, no longer than a respectable baby's cradle, each manned by a dusky figure with a weapon. A little to the left, and considerably in the background of these figures, is a larger boat manœuvering, perhaps, rather clumsily; and, until they round the point yonder, you will hardly discover its import. Hark! "Life on the Ocean Wave" comes rippling in by every breeze; "Rocked in the Cradle of the Deep," rolls along with the surges on the sand. 'Tis a mystic moment. Four girls—a small part of the paraphernalia of a certain surveying party—and nothing more. Women are not always slow to catch an inspiration, so into the current they swing for a peep at the fun. At the most unconscious moment, thug! came a spear into the side of their boat. A glance revealed the fifty savages, with spears aslant, each poised in his boat for an attack. "Great heavens! we are murdered!" cried Mary. "What shall we do?" gasped Anna. "John knew better than to leave us. I shall be dead the next time he sees me," whined Belle. "To the oars and away!" said noble Kate. "They don't like our noise. Don't you see we scare the fish." One tremendous pull at the oars, and our girls are out of danger. Fearing to return home in range of the enemy, they must again round the point and make for the other port—and it is our business to follow.

Port Ludlow owns the largest saw-mill in the world, and under its ample canopy our heroines thought to seek shelter for the night. To steer straight for the port would hardly do, for fear of encountering another hostile fishing party, consequently they decided to land a mile below the mill. It would be safer to feel their way among the logs on land than to take any more chances on the water.

With exhausting efforts a landing was gained. Belle was the first to discover a cap, which she recognized as John's own. "The boys are here; they have lunched on this very spot; here's a cup, a knife, a tin can and Dick's great horseshoe magnet. O, girls, they will be in Seattle to-night, and we won't be there. They will think we have been stolen. Oh, dear! oh, dear!" "Let's shout halloo with all our might," said Kate. "They are not far off, perhaps; they will hear us." So shout after shout the majestic pines looked sorrowfully down on so much misery and sighed and wailed the agony up—up even to the top of Mount Rainier's old bald head, for ought we know—but no beloved John answered. Kate was the first to speak. "Hush! I hear a voice." Very near and in a clear, ringing tone came the word, "Kla-ha-ya!" which

each acknowledge in the Flathead dialect was, "How do you do?" "It's a joy to know that some one human is near us, if it be no more than a poor, old squaw," ejaculated Kate. "That's not an old voice, Kate," said Mary. "Kla-ha-ya?" came again so near the "breath of it did almost cleave their ears." "True enough," replied Kate. "I am nervous to-night. We will know who it is," and a search was at once commenced.

The larger the mill the larger the sawlogs, therefore the logs about the Ludlow mill are all the way from two hundred to three hundred feet in length, and from six to twelve feet in diameter. You can calculate the amount of pluck required to climb a mile of them. But then it is nothing to climb when you know how, and our girls gave no thought to that part of the programme. They are in search of a voice. "Kla-ha-ya?" a third time, but not so frightful. "It's on the other side of the log," and no sooner said than done. Kate was a third of the way over the monster; a moment more and she had reached the pinnacle. One look on the opposite side, and Kate's face turned to an ashen hue. She clasped her hands in an agony of despair, and screamed, "A Jew and a baby!" "A Jew and a baby?" echoed the group below. "No, a jew-fish," answered Kate. "Don't come down, we want to see, too," shouted Anna, and Kate was very soon joined by her companions. Sure enough here was *Mr. Stereolepis gigas* high and dry, and to all appearance fearfully sick. "Why, he is as large as a whale!" exclaimed Mary. "I wonder if he has swallowed Jonah, and has 'come upon dry land to vomit him out?" queried Anna. "You silly girl, didn't the whale rid himself of Jonah centuries ago," replied Belle. "This is no whale. Kate says it is a jew-fish." It's large enough to be a whale, any how," muttered Anna. "Did you say Jonah, girls?" spoke out Kate, who all this time had been quite oblivious to the remarks of the others, "It's the dearest little pappoose that he has in his jaws. See how writhes again," and out popped Kla-ha-ya to the shoulders, spry as a cricket, and back again. The girls laughed outright. "He hasn't the strength to expel her, or else something holds her, I am not certain which," said Kate. A tremendous gust of wind, and puff came a shower, as though an over-stuffed feather bed had been ripped from one end to the other. Feathers flew in all directions; the air was smotheringly thick with them. "Kla-ha-ya!" but this time on the other side of the log. The girls turned, but the atmosphere was still so stifled with feathers they could discern no object. "Kla-ha-ya!" repeated with a wonderfully metallic ring. Another moment, and there was our pappoose reposing on the great horse-shoe maguet, with Belle's embroidery scissors grasped in her tiny fingers. (Belle, by-the-way, had accidentally flung her scissors into the water a few days previous.) "But, Kate," said Anna, "that's not a real pappoose; it has a fish's tail." "A fish's tail!" exclaimed the other three. "Yes; come and see." True enough, a change of position revealed a tail. "It's a mermaid, then," said Kate. "I am so glad. She will soon take off to the water, and then be out of trouble. I fear, however, Dick's magnet has made sad havoc with the fish. But for the secret power in that magnet, the fish could have very easily disposed of the mermaid. The moment she had cut herself loose she had only to flop over the log, as you see."

A weird, strange light began to spread in every direction, and for the first the girls saw that the sun was gone. "Can it be the moon?" whispered Belle. "No; this must be some phosphorescent light," replied Kate. "Let us look about for its source." They had scarcely turned on their heels when directly in front of them appeared an immense cavern, at the entrance of which poised an eagle's wing and a vulture's eye. In the centre, on a huge cake of ice, sat a young seal, apparently floating on a sea of fire. Here in all the glory of the Aurora Borealis sate this creature in state. The dome of this cave was like a canopy of gems; stalactites of every hue of the rainbow fringed the interior. In the soft cadence of the Æolian harp came the melody, "It seems as if this world was made for only you and I." The seal was evidently wooing the mermaid. "Kate! Kate! where are we?" ventured Belle. "Well, I have just determined," replied Kate. "This is the abdominal cavity of that jew-fish, and the facts are simply these:—Like ourselves he is journeying; he wasn't born up here among these pines any more than you and I were. He belongs in the Colorado River and to the south of San Francisco. But this fellow must have been as far north as Sitka to have secured that seal; possibly his objective point was the open Polar Sea." "More likely he was travelling for Barnum or collecting specimens for the Smithsonian Institute," quoth Anna. "The limit of fish intellect is still an unsettled question," replied Kate.

"One thing is certain, like all creatures of the male persuasion, he possesses a ravenous appetite. He has never called for particular recipes for cooking meals, that I know of; but to the contrary, he takes anything and everything that happens in his way. You see that he has feasted on birds, although he was unable to digest their feathers, and he knew no better than to swallow the seal, ice and all; for this lack of judgment he has suffered. The ice from its very nature would freeze his vitals, and furthermore he had previously gormandized to the extent of a ton of sick salmon, which left in a state of repose possesses the wonderful faculty of devouring itself. The salmon to a certain extent is pure phosphorus, and from this phenomena we have also our illumination."

"Verily, the salmon is a wonderful fish," exclaimed the other three girls. "Yes," replied Kate, "but the jew-fish is the biggest eater." REBECCA.

☞ *Correspondents will please address all letters to the Forest and Stream Publishing Company.*

PUBLISHER'S DEPARTMENT.

THE NEXT PRESIDENT.—The politicians are anxious on this subject, but a much more important thing for all who have poor appetite, or skin diseases, or an enfeebled constitution generally, is to know that Warner's Safe Bitters will cure them. $1,000 will be paid to any one who will prove that there is a better medicine of its kind.—[*Adv.*

IMPROVED BATHING.—The insufficiency of the ordinary bath is conceded. Let those who have just taken their ordinary bath rub their skin with the tips of their fingers, and it will be seen that the scarf-skin will come off in dirty granulations, thus proving the insufficiency of the simple bath. The pores are yet clogged. To remove this dead skin (so to speak) something is necessary. After much investigation and numerous experiments, the desired result has been reached, and we are able to recommend to the use of the public, who desire an enjoyment of healthy action of the skin, and especially those whose sedentary occupations results in imperfect action of the pores, the wonderfully efficacious article, Weston-Rowelline, which tones and invigorates the system, lessening liability to ill-effects of sudden changes of temperature natural to our climate. A sample will be sent to any one by addressing, enclosing twenty-five cents, 331 Sixth avenue.—[*Adv.*]

ARE BEARS LEFT-HANDED?—*Bethel, Me., Dec.* —, 1879. —"Ursus," in FOREST AND STREAM, Dec. 18th, gives his opinion that bears are left-handed, because, he says, "they are usually caught by the left foot." For that very reason I contend that they are right-handed. A bear never takes bait directly with his muzzle, but takes it with his paw and so passes it to his mouth if he likes it. The very fact of his stepping his left foot forward into the trap, shows that he intends to take the bait with his right foot. And further, I have seen many a dog which had approached too near his bearship, knocked several feet with the bear's right foot.

I once saw a Boston schoolboy in his vacation, on an excursion with me, against my advice, go too near a bear in a trap to strike him with a club, get all the clothing on the hinder part of his person let down in a hurry with the right foot of the large bear, to the great discomfiture of himself and the amusement of his schoolfellows who were with him. Therefore, I conclude, our Oxford bears are likely to be like us hunters, sometimes left-handed and at others right-handed; they, however, know how to use either hand very spry in an emergency.

J. G. R.

—It doesen't hurt a good man to have his character investigated; neither does it hurt a gold coin to try its ring on the counter.

Forest and Stream and Rod and Gun.

AS WE do not employ any authorized agents or canvassers, we offer our friends in every locality who will give any time or attention to collecting and forwarding subscriptions, the following inducements to obtain subscribers for the **"FOREST AND STREAM"** at the rates and commissions given below:

"THE FISHING LINE."

TAKE THE

Grand Rapids & Indiana R.R.

Mackinaw, Grand Rapids and Cincinnati Short Line

FOR THE

Trout, Grayling, and Black Bass Fisheries,

AND THE

FAMOU SUMMER RESORTS AND LAKES OF

NORTHERN MICHIGAN.

The waters of the

Grand Traverse Region

and the Michigan North Woods are unsurpassed, if equaled, in the abundance and great variety of fish contained.

BROOK TROUT abound in the streams, and the famous AMERICAN GRAYLING is found only in those waters.

The TROUT season begins May 1 and ends Sept. 1.

The GRAYLING Season opens June 1 and ends Nov. 1.

BLACK BASS, PIKE, PICKEREL and MUSCALONGE, also abound in large numbers in the many lakes and lakelets of this territory.

The sportsman can readily send trophies of his skill to his friends or "club" at home, as ice for packing fish can be had at many points.

TAKE YOUR FAMILY WITH YOU. The scenery of the North Woods and Lakes is very beautiful; the air is pure, dry and bracing. The climate is peculiarly beneficial to those suffering with

Hay Fever and Asthma Affections.

The hotel accommodations are good, far surpassing the average in countries new enough to afford the finest of fishing.

During the season Round Trip Excursion Tickets will be sold at low rates, and attractive train facilities offered to Tourists and Sportsmen.

Dogs, Guns and Fishing Tackle Carried Free at owner's risk.

It is our aim to make sportsmen feel "at home" on this route. For Tourist's Guide (an attractive illustrated book of 80 pages), containing full information and accurate maps of the Fishing Grounds and Time Cards, address A. B. LEET, Ger. Pass. Agent, Grand Rapids, Mich.

GUNPOWDER.

DUPONT'S

RIFLE, SPORTING and BLASTING POWDER.

The Most Popular Powder in Use.

DUPONT'S GUNPOWDER MILLS, established in 1801, have maintained their great reputation for seventy-eight years. Manufacture the following celebrated brands of Powder:

DUPONT'S DIAMOND GRAIN,

Nos. 1 (coarse) to 4 (fine), unequaled in strength, quickness, and cleanliness; adapted for Glass Ball and Pigeon Shooting.

DUPONT'S EAGLE DUCKING,

Nos. 1 (coarse) to 3 (fine), burning slowly, strong, and clean; great penetration; adapted for Glass Ball, Pigeon, Duck, and other shooting.

DUPONT'S EAGLE RIFLE,

A quick, strong, and clean Powder, of very fine grain for pistol shooting.

DUPONT'S RIFLE, FG, "SEA SHOOTING," FFG and FFFG. The FG for long range rifle shooting, the FFG and FFFG for general use, burning strong and moist.

SPORTING, MINING, SHIPPING, and BLASTING POWDERS of all sizes and descriptions. Special grades for export. Cartridge, Musket, Cannon, Mortar, and Mammoth Powder, U. S. Government standard. Powder manufactured to order of any required grain or proof. Agencies in all cities and principal towns throughout the U. S. Represented by

F. L. KNEELAND, 70 Wall Street, N. Y.

N. B.—Use none but DUPONT'S FG or FFG Powder for long range rifle shooting.

THE HAZARD POWDER COMPANY

MANUFACTURERS OF

GUNPOWDER.

Hazard's "Electric Powder."

Nos. 1 (fine) to 8 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. *only.*

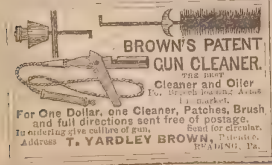
Hazard's "American Sporting."

Nos. 1 (fine) to 6 (coarse). In 1 lb. canisters and 6¼ lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shot guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6¼ and 12½ lb. kegs. Burns *slowly* and very clean, shooting remarkably close and with *great penetration.* For field, forest, or water shooting, it makes any other brand, and it is equally serviceable for muzzle or breech-loaders.

Hazard's "Kentucky Rifle."



FFFG, FFG, and "Sea Shooting" FG in kegs of 25, 12½, and 6¼ lbs. and cans of 5 lbs. FFFG is also packed in 1 and ½ lb. canisters. Burns strong and *moist.* The FFFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard *Rifle* Powder of the country.

DITTMAR POWDER.

Champion Shot Gun and Rifle

POWDER OF THE WORLD!

IS UNEQUALLED BY GUNPOWDER

for strength, accuracy, cleanliness, and gives little smoke, recoil, or noise. It is absolutely safer than gunpowder, as it cannot explode when not confined, and does not strain the gun or heat the barrels as much in rapid firing. Captain Bogardus, champion wing-shot of the world; Dr. Carver, champion rifle-shot of the world; and all the leading shots, use DITTMAR POWDER in their matches. Our challenge to shoot a long range rifle match, as published in our circulars, was never accepted, and is yet open to the world. Address

"Sapanule," the wonderful *Glycerine Lotion*, is a positive cure; it has never failed.

"Sapanule" has no equal for Chronic Lameness, Lame Back, Lumbago, Sprains, Piles, Chapped Hands, Chilblains, Bunions, and all diseases of the Skin, Erysipelas, Salt Rheum, Eczema, Humors of the Scalp, etc.; Diphtheria, Sore Throat, Pneumonia, and all inflammatory diseases. Ladies who suffer from local difficulties find immediate relief, and a permanent cure by using "Sapanule." Used in sponge or foot bath removes all soreness of body, limbs and feet. Satisfaction guaranteed or money refunded.

Sold by all Druggists. Price, 50c., and $1 per bottle. Send for illuminated circular and cards.

Volume 13—No. 24. No. 111 Fulton Street, New York

The East Branch of the Penobscot.

TWO HUNDRED MILES THROUGH MAINE IN A CANVAS CANOE.

THE seeker for health or recreation in Maine, who desires to study nature in its primeval state, and drink from her fountains the blessings which she can so bountifully bestow, has three routes of travel before him. These routes are known as the St. John's River, the West Branch of the Penobscot, and the East Branch of the Penobscot trips, and have for their point of departure the Kineo House, Moosehead Lake, where all that is necessary in camp supplies can always be obtained. The most frequented route, and on account of its ease generally recommended by the guides, is that to the St. John's River, which one reaches by passing north from Moosehead Lake through the West Branch, Chesuncook, Chamberlin, Eagle, and Churchill Lakes to Allegash River, and thence northeast through Canada, emerging from the woods at Great Falls, New Brunswick. The second, or the West Branch of the Penobscot trip, passes southeast through Chesuncook to Ripogenus Lake, and follows the West Branch of the Penobscot River through Pamedomcook and Twin Lakes into the Penobscot River. The third and most difficult course through this wilderness, is the tour of the East Branch of the Penobscot, which leaves the St. John's route at Chamberlin Lake, and passes south through Telosurie Lake, and then east through Telos and Webster Lake and River to the Matagamonsis and Matagammon, or Grand Lake, into the East Branch, and after tumbling over the most picturesque falls and rapids in the entire State, unites with the West Branch of the Penobscot at Medway.

To retain my good health, and enjoy, for the fifth season, the dearly loved woods and lakes of Maine, the summer of 1879 soon found me again within her fascinations, a willing captive to her charms. We have never failed, in the past, to impress upon our friends that one companion is sufficient for company in the woods, but this year, the party, although it had small beginnings, increased in the ratio of the demands of my tastes. As gathered upon the deck of the little steamer *Day Dream*, one bright summer morning, while on her way from the Kineo House to the head of Moosehead Lake, we numbered six souls. I had chosen for my route this year the East Branch of the Penobscot River, a canoe paddle of almost two hundred miles, as offering in its swift running streams, lovely waterfalls and majestic mountains that excitement and adventure which my love of nature craved. In addition to the writer, the party was divided as follows: quartermaster photographic artist, and three guides, named, respectively, Bowley, Weller and Morris. My friend who is designated as Quartermaster did not receive his title from any such position in my expedition, but from holding an office of like character in a New England regiment during the late war; and he proved, by the daily use of his knife in arranging the comforts of the camp, that he was to the manor born. Our Artist was from the "land of steady habits," whose sole duty it was to care for the safety of the delicate camera and glass plates, together with the necessary but ill favored bottles of his kit, and to be constantly on the alert for choice or grand bits of scenery along our route.

The first and oldest of the guides, Bowley, was a man of forty-eight years, and lived at Shirley, Maine. He was five and one-half feet high, weighed one hundred and ninety pounds, had brown whiskers turning to gray, checkered shirt, weather-beaten suit, soft brown hat, and a kind, sympathetic face, which I found, before the trip was ended, truly expressed his manly character. I was sometimes inclined to think him slow, and to find fault with the consumptive color of his biscuit and "flipjacks," and urged him to greater diligence and variety in the cooking department, but in matters of importance he always proved his soundness—but he had one fault; he could scent a "carry" three days ahead, and remember its hardships and burdens two days after. He delighted to tell of his many interesting experiences in the wilderness, and of his geological researches through Maine some years ago, with Professor Hitchcock of Amherst College. His moose, bear and caribou stories were endless. The second guide, Weller, aged thirty-seven years, was a French Canadian from Quebec, but living in Greenville, Maine. He was five feet four inches high, weighed one hundred and fifty-one pounds, with reddish moustache and whiskers, brown hair, and wore a dark-colored woolen suit. He was a fine waterman, and occasionally witty, as is proverbial with his class. The third and last guide, Morris, was a vivacious young man of twenty-three summers, but who looked all of thirty. He was about five feet three inches high, weighed one hundred and sixty pounds, had light brown hair and moustache. Dark blue flannel shirt, and woolen pants constituted his habiliments, which latter garment early in the day proved its inferiority by sundry tears, which gave him a picturesque appearance highly appreciated by our artist. A black felt hat was the crowning feature of his Attire, around which was wound "casts" of varied colored artificial trout flies. He was the most venturesome canoeman of the party, ever first to try the dangers of the many waterfalls and cataracts on our route. Morris was also the hunter, and many a plump duck and partridge found its way to our table through his activity

Our personal belongings were numerous, consisting of woolen and rubber blankets, rubber wading stockings, moccasin shoes, fly rods, guns, landing nets, a lantern, and the very necessary black fly ointment, consisting of oil of tar, glycerine, gum camphor, and oil of pennyroyal. We also had extra changes of underclothing, woolen stockings, buckskin suits, and an assortment of tools, waxed ends, and silk thread for the repairs of broken fly rods.

The number of weapons composing our armory was one Sharps, one Ballard, and one magazine rifle, one 38 calibre revolver, and a double-barrel shot-gun, which also contained two auxiliary rifle barrels. Each man also carried the usual long sheath knife, which latter article was never drawn in a more deadly conflict than that he tween hard-tack and salt pork; nevertheless it was often a trial which brought into play the most heroic qualities of the arm. These made us at once feel invincible against the attack of any wild beasts, while, at the same time, it encouraged such hopes of success in the capture of wild animals, that it even troubled the nightly rest of some of the members of the expedition. Three birch-bark canoes, and one Osgood portable folding canvas canoe, constituted our ships of burden, which exerted great influence in exploring the wilds, and added to the enjoyment of its plessures.

How much poetry and romance, the words birch-bark canoe suggest to our mind. The grand old forests have more tender associations when one is paddled through their lights and shadows in a birch canoe. There are thoughts and reveries which make themselves felt as one examines their construction—a natural fitness of things to the regions in which they are used. The delicate colored bark stripped from a prominent tree, is cut at the ends, and gathered up into uniform bow and stern, cut and then brought together again at the sides alternately, to lift the lines fore and aft. This gives a surface to meet the waves, producing that buoyancy so pleasing in the craft. Then a gunwale of strips of wood is affixed sewed with spruce roots or rattan, and the whole lined from stem to stern with thin strips of wood called "knees." A birch canoe will weigh from eighty-five to one hundred and fifteen pounds, when averaging eighteen to twenty feet, but I have occasionally seen those that weighed three times that amount, and had a longitude of twenty-eight to thirty feet. My portable canvas-canoe, made for this special occasion, was fifteen feet long, with a weight of only twenty-five pounds, when the fish-rod-like stretcher was inserted. This canoe could be collapsed at a moment's notice, placed in a bag 17x38 inches, and carried on the shoulders with ease by one person, while it would float eight hundred and fifty pounds. Before the month's journey was completed, I found I could leap falls and rapids more safely than in a birch-bark canoe, and, although I often paid for my audacity by cutting its surface, it was easily sewed and water-proofed, and I continued on my way. On account of its convenient construction and weight, it could be easily transported through the woods to the small bodies of water off our main course, and explorations made not accessible to a birch canoe.

As we were to pass through a country uninhabited, we were obliged to provide ourselves from the start with food sufficient for the entire thirty days' sojourn; and it may be interesting to the reader to know the quantity and variety of the supplies, should he ever undertake a similar enterprise. We did not rely upon the game or fish of the country we were canoeing. Like excursions in the past had taught us that these articles were more incidental surprises than an excess of the daily *menu*. Very few tourists to Maine select this, the hardest of of routes, and we found afterwards that we were the first party who had passed down the East Branch of the Penobscot River during the year 1879. A "camp appetite" is something entirely different from what one enjoys at home. One would turn in aversion from the plainess of the fare, were it placed on the table. But the surroundings, and the daily vigorous exercise, seemed to make us forget the homely dishes, and articles refused at our own boards are devoured in the woods with avidity. Most of the provisions were packed into wooden pails of various sizes, the balance in canvas bags, and were assorted as follows: 84 lbs. of hard tack; 73 lbs. of flour; 1 bushel of potatoes; 12 lbs. of salt pork; 4 lbs. of beans; 2 packages of baking powders; 2½ lbs. of cheese; 10 lbs. of ham; 3 lbs. of candles; 1 bottle each of pickles and chow-chow; 3 cans of potted ham; 7½ lbs. of onions; 12 lbs. of canned corned beef; 6 lbs. of maple sugar; 1 dozen cans of condensed milk; 3 lbs. of tea; 7 lbs. of coffee; and 13 lbs. of granulated sugar, besides a quart of oil for our lantern, which latter article was one of the most useful of the lot. Sugar, either maple or granulated, always disappears in the woods at an early date, and the immense quantities of luscious blueberries and blackberries to be had at any time along our route, greatly facilitated its departure. Our canoes, when packed with all the above articles, and further embellished by sundry tea and coffee pots, kettles, frying pans, broilers, bakers, tin plates and cups, reminded one of the early days of our forefathers, and their pilgrimages to the "Far West." The country towards which we had set our faces was entirely new to tourists, and but one of our guides (Weller) had ever explored its hidden depths, and even his memory was so treacherous as to be of little service to us. Recently issued maps were very faulty, and we were obliged to make many corrections on them, and fabricate the geography as we sailed along.

On reaching the head of Moosehead Lake our many boxes and bags just enumerated were transferred to the sadly dilapidated wharf at the northeast "carry," and afterwards removed by the guides to a heavy lumber box wagon, drawn by a single horse, while the birch canoes, supported by long poles, were lashed at the sides of the cart, Our artist, to secure his photographic materials against harm, rode in front with the driver, but the writer, in company with the Quartermaster and guides, trudged along in the sand at the rear.

This "carry," or path, is about two miles long, rising gradually towards the middle from each end, and terminates on the north at the West Branch of the Penobscot River. There are log houses where one can obtain dinners at either end of this portage, but as our guide, Morris, lived at the further point our party chose to lunch at his house, and our recollections of his mother's preserved strawberries, fresh cream and bread are alive to this hour. After dinner we immediately betook ourselves to the river's bank, launched the birch canoes, stretched the canvas canoe into shape, and balancing the crafts to a nicety with our baggage, swung off down the stream for a month's exploration of the inmost heart of Maine.

One well knows the delights attending a pic-nic in the woods for a day. Arising at early morn and carefully stowing away in baskets sundry choice and toothsome articles, and filling the covers of the basket with beautiful bright flowers from our gardens, we resorted to the woods, and dividing into groups under the shady trees, we spread on temporary tables the savory dishes, and strove to the best of our ability to get in sympathy with nature. But think of a month's pic-nic, daily filled with excitement and pleasure, from running rapids and falls in a canoe to enticing the wary trout or picking strange flowers and berries by the brookside, and at night resting one's tired but invigorated body under a snow white tent, The West Branch of the Penobscot (or Rocky River), after leaving the terminus of the northeast carry at Morris's, flows steadily to the southeast with hardly a ripple for some two miles, until it reaches the mouth of Lobster Stream. Then a stronger current is perceptible, with "rips," and this continues for two and a half miles more, when, after passing a small island, the water again becomes "dead." The birch barks, paddled by guides Weller and Morris, preceded us down the river, while the Quartermaster and I followed in the canvas canoe, the fourth canoe, with guide Bowley and the Artist, bringing up the rear.

Could there have been a looker-on from the shore he would have possibly thought it was a Government expedition in search of the northeast passage, but although our destination was about as little frequented, it was not so grave an affair. After paddling until late in the afternoon through eight or ten miles of still water, we made our first camp on the right bank of the river, at the mouth of the Moosehorn Stream, and transferring our kit to the shore, turned over our canoes in the sun to dry.

THOMAS SEDGWICK STEELE.

(To be Continued.)

THE BLUE GILL CAMPAIGN.

THE Blue Gill Club is composed of six paying members, limited by their constitution to that number. We, being congenial in spirit, have refused applications for membership for fear that a seventh paying member might be a drone and put us in the hands of a receiver, which we so far have avoided, for we all pay and work alike—no grumbling. Our 1879 campaign was the fifth since our organization. We have a constitution and by-laws, and proper officers; funds go into the hands of one member, who is secretary and treasurer, who purchases and pays for everything necessary for a trip, including tickets and freight, and attends to the procurement of special rates and favors. We have also a commissary, who is a first-class cook; he is one of us and very valuable, being a carpenter by trade and a tip-top jack of all trades; he can tie all the knots and make the splices of an old tar; his expenses are all paid for his services. We

always camp, having our own equipage, boats, tents, etc.; our outfit is nearly perfect, much of it having been obtained by reading the FOREST AND STREAM advertisements. Our government is so perfected that we can estimate almost to a pound what supplies are necessary for a given length of time. Having obtained rates of fare and freight, etc., and decided upon the length of the trip, an assessment is made and paid in at once, supplies purchased and shipped together with baggage to destination, and we follow in a day or two. Our set day is July 5th of each year, first train out. We have always started on that date. Three annual trips have been made to Syracuse, Indiana, and one to Maxinkuckee, Indiana. This season, on the strength of Hallock's trips through Michigan, and by special invitation of the Forester Club, of Cadillac, we decided to take Michigan—assessment $25 per capita, paid—and on our day we started on very low rates granted us by the G. R. & I. R. R., for Cadillac. We must say that the employees of all grades on that road are as gentlemanly, polite, and accommodating as can be found; their kindness and favors tended to make our journey pleasant and in short we can hardly say enough in their favor. Arriving at Cadillac we were soon in the hands of the Foresters, who almost put us to shame and under so many obligations by their attention and favors, that we will be unable to extricate ourselves manfully. They are the leading men of the city, true sportsmen and all heart, and a sportsmen is always welcomed by them. Permit me to mention the few names I now remember: Silas Tam, President of the Foresters, Messrs. Moyer, McIntre, Mitchells, McDonald, Peck, Salone, Kennedy, etc., each and every one of them hale fellows well met.

Having partaken of a sumptuous dinner at the residence of President Tam, we wended our way toward Little Clam Lake, where we were met with a pleasant surprise: the Foresters had gone before, and on reaching the dock we found a pretty little steamer, well loaded and snorting; our supplies, baggage and ice had been snugly stored and boats tied astern. Well, it seemed too good to be true, but true it was, and well pleased were we, for we were not used to such treatment on our trips. We concluded we were prisoners for once, and would have to obey orders. In a few minutes we were steaming for Big Clam Lake, which we reached long after dark, and pitched our tents temporarily for the night. We remained in this camp ten days, during which time we had some very fine bass and pickerel fishing. During our stay many pic-nic parties visited us, and the boys made us regular party calls. We here met and became acquainted with many of the whole-souled lumbermen, among whom were Jack and Gene, pilot and engineer of the "Mitchell Lumber Company's" steam barge for towing booms. These two big-hearted sons of toil took a liking to us and said: "Boys, when you get ready to leave, drop your flag to half mast, and we will come in and take you to town for friendship sake." We accepted. On the evening of our ninth day the flag was down half way; next morning at six a young hurricane came upon us, bringing Jack, Gene and the barge in, blowing our tents down and raising Cain generally. We soon had things aboard, and just in the nick of time, for an awful wet rain came down in torrents. We started, and Big Clam being studded all over with sand bars and the channel so crooked, it required a great deal of poling to keep the barge off the bars.

In due time Cadillac was reached, and the same reception awaited us as on our first arrival. By night we voted to go up to Bear Lake. Treasurer purchased tickets. Learning from the conductor that conveyances could not be had at night to convey us from Melrose station to Bear Lake, Superintendent Matheany was telegraphed for advice, who answered: "Tell the boys to come on to Petoskey." Another call on the Treasurer and we stood by the train; at Petoskey everybody had the best place to go fishing; one said here, another there, and so on, until we concluded we were muddled and did not know where to go; a vote of the Club stowed us in bed at the "Occidental" to dream over the matter. Up at five A. M. next day and decide on Crooked Lake. The Bay View and Crooked Lake Railway, or tramway, having been completed the day before, we bought the first six tickets sold on this road, and put the first baggage on the baggage car—so much honor for us—had a delightful ride until the grade at Round Lake was reached; here the engine made three attempts to get up, but failed. Thereupon all hands jumped off and pushed the thing up hill; all went well until a sharp curve was reached, when the push came into play again; finally reached the lake in safety, loaded our goods into a small schooner, a stiff breeze blowing just right, and we went a sailing. About four miles up we disembarked and pitched camp beside one of nature's best gifts, a spring of water. Fished Crooked Lake without any marked success; somewhat discouraged; but Texas Jack, Limber Jim, and Barney the Guide, started with an expedition to find something. They came back with Arabian Night's stories about a lake that had millions in it, whoppers; it was Pickerel Lake, and had enough in it to supply your uncles, aunts, cousins, etc. We in camp believed, because some fine samples were brought in; this encouragement put us to work in building our live box, a scheme of our own. We bring with us wire screening three feet wide, drive stakes in the ground in two feet of water, put the screening around the stakes and press down in the sand; this makes our aquarium ten feet square, and it will hold a large number of fish. We let eighty bass, averaging three pounds each, loose when we broke camp here. That is our honor number two. Having completed the aquarium, minnows were caught, cup of warmed coffee drank, and we retired inside our mosquito bars, leaving plenty of mosquitoes and such on the outside. The following and every day thereafter that we fished, catches were immense, bass and pike in plenty, of large size—all game, in forty feet of water. There were some fellows there that would break a hook and walk off with a line whenever they felt like it. My "Leonard Greenheart" rod was thoroughly tested, and I now feel that I could play a whale with it. We intended to remain at this camp six days, but the wooden railroad engine ran off the track, and was in the hospital two days, which put us back two days from a grayling fish which we determined to have. But we were at the mercy of these railroad magnates, Rose and Matheany, owner and managers of the B. V. & Crooked L. R. R. After a little fuss and a few feathers we cooled down and placed ourselves under the care of Capt. John Andrews to get us off, which he accomplished in due form of law. By the way, he has placed a floating palace on the chain of lakes—Crooked, Mullett and Burt—which will accommodate twenty persons at two dollars per diem. This includes board, lodging, boats, minnows, etc., and the palace to be anchored at any point designated by the boarders. He will make a daily visit from the landing to the palace with his tug, carrying mail and furnishing supplies.

Starting south, we dropped off on reaching the home of the Foresters, found things in readiness for our grayling hunt. Boss McIntyre, who has an aversion to swearing and does not like to hear it (in this respect he resembles Si Tam), hitched up his team of "pullers," loaded our baggage, packed the ice, and started with us for Pine River, twenty miles away. This trip was the climax: we went up and down hill, over stumps, logs, through brush mud and sand, reaching camp about midnight; having been pretty thoroughly bounced for over ten hours, we went to bed to see how still we could lie for the next ten hours. I do not believe a man or a horse stirred or moved a hair until Old Sol had risen. Grayling fishing and fly fishing and casting was new to all of us except Mc——, who is an old stager at the business; but we beginners did well enough to satisfy ourselves and find out that you cannot coax a grayling if he don't want to. This kind of fishing has now caught us, horse, foot and dragoon, and the Blue Gills will take it all in again next year. In July the grayling were feeding on a small black beetle: this we found upon examination.

The whole trip has filled us with newness of life; it was filled with little mishaps, delightful scenery, pleasantries, nominal accidents, experiences that were enjoyed, such as slipping on the clay and going down clear under that ice-cold water, the taking off of our wagon wheels on a bridge and letting them down forty feet by ropes to soak the felloes, sawing off logs run into in the dark, etc., etc., all taken together would be sufficient to write a book, and too much to crowd into a letter. There are many little incidents I would like to write of our trip: George Moon's bear hunt, the bear and snake scare, etc. As I sit writing this I live the whole trip over, and find myself among the Foresters, and become excited and see grayling before my eyes. Next year I shall keep a diary as I have always done, this season excepted.

I do not want this article to be the means of any reader therof going to Michigan expecting all sunshine, for they may be disappointed, perhaps more so than a party of "Buckeyes" who went this season to Burt Lake (the day we reached Crooked L.) with supplies for six weeks, intending to remain that long, and just because the first night they were in camp four of their number upset themselves into Indian River they paddled home in five days. The Solid Comfort Club of Pennsylvania were stickers: they owned Indian Point for a while.

In closing, allow me to say that visitors to Michigan for pleasure will find that everybody up there will do all in their power to make it pleasant for them. Our trip, six men four weeks, cost $190. WILLIS D. MAIER.

Fort Wayne, Ind., 1879.

Natural History.

MEXICAN BIRD NOTES.

CITY OF MEXICO, *Nov. 20th*, 1879.

The Valley of Mexico is, as ornithologically considered, situated in the Central Province, for Mexico, like our own country, is divided into three distinct, and separate divisions or provinces; the Eastern, extending from the Gulf of Mexico to the high inland plains; the Central, including the Mexican table lands; and the Western, extending from the Sierra Madre Mountain range to the shores of the Pacific. With us the divisions are widely extended, and they are in a great degree defined by the main and secondary axis of the continent, or by the difference in moisture between the Mississippi Valley and the arid plains of the interior; and here we find the same great law of division carried out; but the barriers separating the Provinces are much more distinctly defined, and the divisions themselves are much less extensive than those of the North.

The Eastern Province is much the largest of the three, while in the Western we see the smallest. Both of these are purely tropical, not only in fauna, but in flora, though of the two the Eastern is the most productive of both animal and vegetable life, for here, owing to the moist condition of the atmosphere, vegetation is found in the highest profusion, rivaling the greatest beauties of tropical nature, and as a natural consequence animal life is more abundant. On the contrary, the Pacific slope is very dry, and vegetation is much retarded. This is owing to the fact that the formidable mountain barriers intercept the warm currents of air, bearing their loads of moisture towards the west, and this is condensed falling upon the eastern slope, to add greater volume to the streams which deepen the color of the already dark green leaves, leaving the air current to continue its way, but not to add life and vigor to the withered leaves of the western plain, but seemingly to mock them with the taunt that their time is not yet. When the rainy season comes they may brighten and shine in the sunlight of spring, but only for a short time, and then again their drooping heads are once more lowered.

In the Central Province we find more than in either of the other divisions, the birds of the United States. The reason for this is evident, when we observe that the mountain ranges which border the table-land expand as they reach their long arms northward, one turning westward toward California, and the other eastward toward the Central Plains of the United States. Thus the migratory birds, when forced southward by the frosts of early autumn, are retreating into the large end of a funnel, which contracts as they proceed southward, so that by the time they reach the Valley of Mexico they are forced into a range of not more than seventy miles in width.

Aside from the general peculiarities of the three Provinces, each has some special ones of its own. More especially is this true in the Central Division, where a distance of twenty miles will produce such a change of temperature and local circumstances that the birds will be found to be of an entirely different type from those found seven leagues away. For example: One may leave the City of Mexico in either of these directions, Texcoco on the east, Cuernavaca on the south, or north, and by going a distance of from eight to ten leagues he will find the birds entirely different from those which he is familiar in his every day walks in the neighborhood of the city. Thus to definitely establish the distribution of species in Mexico, would take a vast amount of time, coupled with great labor. My own work so far has been in the neighborhood of the capital, though I soon expect to leave for the country where I can more advantageously pursue my studies. In the few short trips I have made into the country, I have met with the following species which I have recognized:—

Carpodacus frontalis. Crimson fronted Finch. The most numerous of all the birds I have seen found elsewhere.

Scolecophagus cyanocephalus. Brewer's black bird. Very common. Equals in number *Q. purpureus* of the North.

Eremophila alpestris, var. *chrysolæma.* South-western lark; Seen in pairs upon the shores of Lake Texcoco. Quite shy.

Catherpes Mexicanus. Mexican wren. Replaces *T. ludovicianus* of the United States. From what I can observe, its habits are much the same.

Dendroeca Audubonii. Audubon's warbler. This is the only warbler I have seen, and it is quite numerous; like *D. coronata* it keeps company with sparrows and finches.

Tachycineta bicolor. White bellied swallow. Every time I go outside of the city I see numbers of these beautiful birds gracefully flitting through the air.

Pyrocephalus rubineus var *Mexicanus.* Vermillion fly-catcher. This beautiful little bird has been seen by me three times. The male I think to be the most beautiful of all the fly-catchers; its beautiful crest and under parts rival in color the brilliant hues of the scarlet tanager.

Sparrows are quite numerous, but I have not perfected my collection in them yet. Hawks are plenty and very tame. Ducks are seen at all times of the day, and I think they are killed in great numbers, from the frequency with which they are served to us at the restaurants.

In my next I shall endeavor to give some observations of the habits, etc., of our Mexican birds. A. W. BUTLER.

LIST OF BIRDS TAKEN AT PEMBINA, DAKOTA.

JULY, 1879.

1. *Turdus migratorius*; robin—not very common.
2. *Harporhynchus rufus*; brown thrush—not common, and much more shy than in the East.
3. *Mimus carolinensis*; cat-bird—common.
4. *Sialia sialis*; blue bird—only one seen.
5. *Sitta carolinensis*; white-bellied nuthatch—very common.
6. *Troglodytes ædon*; house wren—common.
7. *Cistothorus stellaris*; short-billed marsh wren—very common in the sloughs.
8. *Eremophila alpestris*; shore lark—common on the freshly-broken prairie.
9. *Dendroeca æstiva*; yellow warbler—common.
10. *Oporornis agilis*; Connecticut warbler—a male taken July 11.
11. *Geothlypis trichas*; Maryland yellow throat—common.
12. *Setophaga ruticilla*; redstart—several shot July 16.
13. *Tachycineta bicolor*; white-bellied swallow—not common.
14. *Petrochelidon lunifrons*; cave swallow—very numerous; several large colonies nesting in the village.
15. *Stelgidopteryx serripennis*; rough winged swallow—only one seen July 13.
16. *Progne purpurea*; martin—one colony nested in Pembina.
17. *Ampelis cedrorum*; cedar bird—common.
18. *Vireo olivacea*; red-eyed vireo—common.
19. *Vireo gilva*; warbling vireo—several taken July 14.
20. *Collurio ludovicianus*, var. *excubitoroides*; white-rumped-shrike—one pair seen, very shy and difficult to approach.
21. *Chrysomitris tristis*; yellow bird—common.
22. *Passerculus savanna*; Savanna sparrow—the most numerous bird, occurring on the prairie wherever there were any bushes or brush, especially along the edge of the timber.
23. *Poœcetes gramineus*; bay-winged bunting—not very common, and we took but few specimens.
24. *Coturniculus lecontei*; Leconte's bunting—very common in the sloughs on both sides of Red River; they were similar to marsh wrens in their habits, and generally kept in the tussocks of grass. They were quite difficult to shoot, and still more so to find when shot, so that but few specimens were taken.
25. *Coturniculus henslowi*; Henslow's bunting.
26. *Spizella pallida*; clay-colored sparrow—generally numerous in bushes and low second growth.
27. *Melospiza melodia*; song sparrow.
28. *Goniaphea ludoviciana*; rose-breasted grosbeak—very common in the timber along the Pembina River.
29. *Pipilo erythrophthalmus*; chewink—met with but once.
30. *Dolichonyx oryzivorus*; bobolink—very common on the prairie, especially where there were scattered bushes. Specimens shot July 16, had begun to change their spring plumage. They were then commencing to go in flocks.
31. *Molothrus pecoris*; cow bird—common.
32. *Agelaeus phœniceus*; red-winged blackbird—not so common as next.
33. *Xanthocephalus icterocephalus*; yellow-headed blackbird—great numbers on the sloughs in company with the redwings.
34. *Sturnella magna*, var. *neglecta*; meadow lark—common, and quite as shy as its eastern relative.
35. *Icterus baltimore*; Baltimore oriole—generally common in the woods along the Pembina.
36. *Icterus spurius*; orchard oriole—not nearly so numerous as the last.
37. *Scolecophagus cyanocephalus*; Brewer's blackbird—the most common of the blackbirds.
38. *Quiscalus purpureus*; crow blackbird—several flocks met with.
39. *Corvus americanus*; crow—common.
40. *Cyanurus cristatus*; blue jay—common, very shy, as much so as in the "East," and differing in this from those since met with in Northern Iowa, where they were quite as tame as the European sparrows in our streets.
41. *Tyrannus carolinensis*; king bird—very common in all localities near the timber.
42. *Empidonax* (spec.)—a young fly-catcher taken too young to determine the species (probably *Traillii*).
43. *Antrostomus vociferus*; whippoorwill—heard on one occasion.
44. *Chordeiles virginianus*, var? Night hawk—a number were seen, but as none were shot, cannot say whether they were of the Eastern or Western variety.

45. *Chaetura pelasgia*; chimney swift—common around woodland, where they probably were nesting in hollow trees, from the entire absence of chimneys in that section of the country.

46. *Trochilus colubris*; ruby-throated hummer—common.

47. *Coccyzus erythrophthalmus*; black-billed cuckoo—one of the most common birds in the timber.

48. *Picus villosus*; hairy woodpecker; several specimens taken.

49. *Picus pubescens*; downy woodpecker—common.

50. *Sphyrapicus varius*; yellow-bellied woodpecker—two specimens taken, one of them a young one just out of the shell, July 15th.

51. *Colaptes auratus*; flicker—common.

52. *Falco sparverius*; sparrow-hawk a female taken July 10th.

53. *Circus cyaneus*, var. *Hudsonius*; marsh-hawk—very common on the prairies everywhere.

54. *Buteo borealis*, var. *Kriderii* (?); white-breasted hawk—a buzzard with white breast and head flow over out of gunshot, at St. Vincent. Since that time, during the latter part of August, we found this hawk quite abundant in Northern Iowa, where we took several specimens.

55. *Ectopistes migratorius*; wild pigeon—one small flock met with.

56. *Zenaedura carolinensis*; Carolina dove—a single individual met with July 16th.

57. *Pediœcetes columbianus*; sharp-tailed grouse—common, saw several covies just able to fly July 18th. They were generally on the edges of the prairie, among bushes and scattered trees.

58. *Aegialitis vociferus*; killdeer—common.

59. *Tringa minutilla*; least sandpiper; a pair seen July 17th.

60. *Totanus flavipes*; lesser yellowshanks—saw four individuals of this species on Red River.

61. *Totanus solitarius*; solitary sandpiper—not very common.

61. *Actiturus bartramius*; upland plover; one of the most frequent birds on the prairie.

63. *Botaurus minor*; bittern, "slough pump"—a very common inhabitant of the sloughs.

64. *Grus americanus*; whooping crane—a flock of three met with July 6th.

65. *Porzana carolina*; common rail—very numerous in the sloughs. The notes of the Virginia rail were also frequently heard, but it was impossible to catch sight of them.

66. *Anas boschas*; mallard—breeding in large numbers, together with other ducks whose species were not determined.

67. *Hydrochelidon lariformis*; black tern—breeding in great numbers in some sloughs about a mile from Pembina.

WM. L. ABBOTT.

LITORINA LITOREA ON THE AMERICAN COAST.—We have received from our correspondent, Mr. Arthur F. Gray, of Danversport, Mass, a short paper with this title, which originally appeared in the *Science News*. The account of the importation of this species from Europe and of its gradual extension along the American coast from Halifax, south to Long Island Sound, is very interesting.

TENACITY OF LIFE IN A BEETLE.—A correspondent of *Notes and Queries* gives the following instance of a beetle's tenacity of life: A relative of mine, while recently cutting a loaf of bread, found embedded in it a beetle. A small portion of the loaf with the insect in it was cut out entire, and after the lapse of about five minutes the beetle began to crawl out, apparently none the worse for its incarceration. It is, of course, well known that beetles are fond of warmth, but I should not have thought that one would have so comfortably survived some hours spent in a living tomb, escaping the danger of being crushed to death in the making of the bread, and subsequently the risk of being killed either by suffocation or the heat of the oven.

FURTHER NOTES ON THE NORTHERN WAXWINGS IN MINNESOTA.—*Minneapolis, Minn., Dec. 27th*, 1879.—In a communication dated Dec. 3d, I reported the northern waxwings (*Ampelis garrulus*) as abundant at this place, and so they were at that time and up to the end of the first week in December. About that date the greater part of the birds disappeared from the city, and since then only occasional pairs or stray flocks have been seen.

We have been having intensely cold weather and much snow, but I do not attribute their disappearance so much to this, as to the fact that nearly, if not all, of the berries (mountain ash, highbush cranberry, etc.) have been stripped from the trees throughout the city, where they are much cultivated for ornament. Whether the birds have really gone further south, or whether they have merely settled down in some locality near by where food has been found, I cannot at present say. They are very fond of the wild grapes that remain hanging on the vines, and as the valley of the Minnesota River, and several other places not far distant, abound in grape vines, they may have left the town, which the berries at first induced them to frequent, and retired to feed where food has been found in sufficient quantity. If so, we shall find them again shortly. At all events we shall probably see more of them towards spring now that they are in this part of the country.

I neglected to mention in my former note that the majority of the birds that appeared here were what we took to be young birds. They were not highly plumaged, almost lacking the waxy appendages, and the markings of the wings were white instead of yellow.

In a letter dated Martinsdale, Montana Territory, recently received from my friend, Mr. Robt. S. Wiliams, is the following in regard to the waxwings which will be of interest as a report from another locality: "The waxwings put in an appearance here about the same time as in Minnesota. They are said to be very common some sixty miles down stream (Musselshell River) among the pines." T. S. ROBERTS.

SHOWERS OF SPIDERS' WEBS.—*Waterbury, Conn., Dec. 9th*, 1879.—In your issue of last week, you reply to Mr. Boardman's article, entitled "Showers of Spiders' Webs," and say: "Can any of our readers assist," etc. Your impression as to Darwin are correct; in his journal of the voyage of the *Beagle*, he says: "While anchored in the River Plata, sixty miles from shore, I saw the rigging covered with cobwebs and the air full of floating webs. The spiders, however, when they struck the ship, were always hanging from single threads." Mr. Darwin does not undertake to give any explanation of the phenomenon; indeed, I do not know of any naturalists who have given an intelligent solution of such appearances as your correspondent describes.

Your readers may be interested in the recital of my own observation on the subject. Several varieties of the Spider family, particularly the young of several species of *Lycosa*, are aeronauts; they are more sensible, however, than human aeronauts, for the spider always selects a clear, warm, and comparatively still day in the autumn months in which to take his flight, and after the dew has disappeared, he chooses with great care the highest weed or shrub in his immediate neighborhood, and climbing to its topmost leaf or twig, he at once proceeds to anchor himself by a web cable of considerable strength, by attaching it first to the leaf or twig and then to his body. Then, standing on tiptoe, he elevates the hind part of his body and from his web reservoir (spinnerets) he spins out numerous gossamer threads or streamers, which seem lighter than the atmospheric air, as they rise and float above; presently you may see the spider rise also, and the anchor cable straighten, when, with a sudden stroke of the leg, he cuts loose and sails gracefully away high above the earth. When one of these spider holidays occur, in the middle of the day by lying on the back and looking up, one can see myriads of these silver threads floating slowly along. In Germany, these flights of gossamer are called *Der flugen der Sommer*, (the flying or departing summer.)

The intelligence (reasoning?) evinced by these little insects in their descent to the earth is as marvelous as in their ascent. When they get tired of their aerial flight, they begin to pull in the long threads or streamers with their fore feet and form the web into a tangled mass beneath them, and so gradually lessen the floating capacity of their balloon until they quietly alight, as I have often seen them with but a single streamer out. The number of these floating spiders in an autumnday is prodigious, and no wonder their webs resemble a "shower," and are spread as a net over the earth. I have, myself, seen upon the prairie, the ground so covered as to have the appearance of a web attached to every blade of grass.

Will some one explain why those streamers, or threads of web apparently thrown out by the spider, never converge towards, but always diverge from each other; is it caused by a subtle electrical current, emanating from the insect, or a current passing up and off the point of the weed, or—what is it? W.

Fish Culture.

THE CALIFORNIA SALMON CONTROVERSY.

THE California salmon controversy, carried on in these columns by Messrs. Livingston Stone, and E. A. Brackett, has not been as to whether or not these fish all die after spawning, but as to whether or not Mr. Livingston Stone said that they all died, and whether Mr. E. A. Brackett said that Mr. Stone said that they all died. The interests of fish culture and of science invite a full, free and exhaustive discussion of the original question, but neither the interests of fish culture nor of science warrant us in continuing further the controversy as to what any one man did or did not say. We take it for granted that both Mr. Brackett and Mr. Stone desire rather to arrive at the truth in regard to this fact of natural history, and that they hold their own individual and personal interests subservient thereto. It is due to each, however, and to the Massachusetts Fish Commission, which Mr. Brackett represents, that what appears to us to be a mutual misunderstanding, should here be rectified; and we have accordingly taken some pains to review the dispute, which began over a year ago:—

1. The Massachusetts Report (year ending Jan 1st, 1878), under subject, "California Salmon," details the hatching and distribution of 200,000 spawn, and adds: "We do not profess to know the habits of these fish. * * * Mr. Livingstone Stone, in his report to the United States Commissioners of Fisheries, asserts that they spawn but once, and then *die*." The writer then goes on to give the reasons adduced by Mr. Stone regarding the McCloud River fish.

2. In the FOREST AND STREAM of May 15th, 1879, Mr. Livingston Stone complains that "in several newspaper articles and State reports I have been quoted as saying that 'All California salmon die after spawning,'" and he asks to be told where he has made such statements.

3. In the FOREST AND STREAM, May 29th, 1879, in connection with a letter from Mr. B. B. Redding, California State Fish Commissioner, addressed to Prof. Spencer F. Baird, adducing "positive evidence that 5 per cent. of Sacramento salmon do not die the year they reproduce," is published a communication from Mr. E. A. Brackett, Massachusetts Commissioner, in which the writer explains to Mr. Stone that "the California salmon of the Sacramento and its tributaries are the fish that have interested the State Commissioners as well as the public, and whatever criticisms or remarks have been made in the State reports have reference to these salmon and to no other." Mr. Brackett then quotes Mr. Stone's testimony as given in the United States Commissioner's Report, 1872-73, that "the salmon of the McCloud and Little Sacramento do not spawn but once in these rivers, for they all die after spawning."

Replies and counter-replies have since been published, but they have consisted, mainly, of reiterations of former statements, and we need not repeat them here. The merits of the case lie in the correspondence already quoted, and are substantially as follows:

a. The assertion quoted by Mr. Stone above:—"All California salmon die after spawning"—is not contained in the Massachusetts Report. The language, "Mr. Livingston Stone * * * asserts that they spawn but once, and then *die*," might have been legitimately interpreted by that gentleman as applying to "California Salmon," the subject then being discussed by the writer.

b. Mr. Brackett's explanation, in his communication to the FOREST AND STREAM, that "whatever criticisms or remarks have been made in the State reports have referred to these salmon [*i. e.*, of the Sacramento and its tributaries], and to no other," was an ample and entirely satisfactory one, and, so far as the Massachusetts Report was concerned, should have been accepted by Mr. Stone.

With this review of the matter, which we have attempted to make a just one to both parties, we must close the subject.

THE UNITED STATES REPORT.—The Report of the United States Commission of Fish and Fisheries, by Spencer F. Baird, Commissioner, is a large volume of something over a thousand pages, embracing, besides the report proper, an exhaustive history of the Menhaden, by Prof. G. Brown Good, and a variety of original and foreign essays on fisheries and fishing methods. The Report will afford ample material for two or three papers, the first of which will appear next week.

—The Thompson Brothers have a lot of yearling trout for sale at their Aquetong Pond, New Hope, Penn. See their advertisement elsewhere.

SHRIMP TROUT FOOD.—*Rochester, Jan. 8th*—The N. Y. State Fishery Commission will furnish a supply of fresh water shrimp from Caledonia Creek for the purpose of stocking any streams or ponds in this State to any parties who will pay the express charges on cans from the N. Y. State hatchery to place of destination and return. There is no better food for brook trout and other small fish, and they breed very rapidly. Address

SETH GREEN, *Rochester, N. Y.*

I began the use of gas tar in 1864 instead of 1854, as published last week.

FISHING RESORTS.—*Attention is invited to the notice at the head of Game Bag and Gun columns.*

FISH IN MARKET—RETAIL PRICES.—Bass, 25c.; smelts, large, 15c.; smelts, green, 15c.; bluefish, 12½c.; salmon, frozen, 30c.; mackerel, large, 25c.; shad, Southern, each 50c.; green turtle, 15c.; terrapin, $20 per dozen; frost fish, 6c.; halibut, 20c.; haddock, 6c.; codfish, heads off, 8c.; heads on, 6c.; blackfish, large, 15c.; flounders, large, 10c.; sea bass, 18c.; eels, large, dressed, 18c.; lobsters, live, 10c.; boiled, 12c.; scollops, per gallon, $1.; soft clams, per 100, 30c.; large, 60c.; whitefish, 15c.; pickerel, 15c.; salmon trout, 18c.; black bass, 18c.; hard crabs, per dozen, 40c.; soft crabs, per dozen, $1; red snappers, 10c.

On Friday last E. G. Blackford, Fulton Market, New York, received a shad, caught at Dobb's Ferry in the Hudson, weighing 5 lbs. Sold for $5. A few shad are coming in from Florida.

FISH SWALLOWING FISH.

The last of what have already become famous as the FOREST AND STREAM fish stories are published to-day. The publication of several other manuscripts has been necessarily deferred until a future date, when they will appear. We must crave the indulgence of all contributors whose favors have been delayed, as we have been sadly pressed for room. Much trepidation has been felt in this office lest the columns of the paper devoted to Sea and River Fishing should absorb all the other pages, and the FOREST AND STREAM thus afford a melancholy example of the phenomena under discussion. An unflinching use of the excising pen has been found effective, and, being plied as ruthlessly as the jack-knife of the man swallowed by the whale, has brought us out upon dry land again.

It is unnecessary and it would be unbecoming to plume ourselves upon the extraordinary character of the narratives submitted in competition for the big hook. The startling character of some of them, the impressive tone of others, and the bewildering, mystifying and completely staggering intricacies of still others, have proved entirely too much for the Civil Engineer, the Scientific Professor, the Fish Commissioner, the Logician, and the Cabinet Officer, who were appointed a committee of five to make the award. They have released themselves from the dilemma of awarding the big hook by giving to every competitor a little hook, which we hope may serve for each as a pleasant memento of their angling in FOREST AND STREAM.

WASHINGTON, D. C., *Dec. 20th*, 1879.

Editor Forest and Stream:—

That authentic narrative of the fish, which swallowed itself tail first, is very good; but before you send the hook, please hear me. It is useless for any one else to compete, if the prize is to be given for the truest story of the biggest fish ever swallowed. Professor Gill, of the Smithsonian, who missed a few days ago, and his absence remained a mystery until explained. He was examining a small specimen, known as the *Gillichthys*, when that fish, enraged to the Professor's avowed intention to classify it under a new name, leaped at him, open-jawed, and swallowed him, boots and all. How he ever got out was the question. Some thought, not unnaturally, that the Professor disagreed with the fish, and was disgorged on that account. The fact is, however, that the learned eichthyologist took advantage of the situation to investigate the anotomical arrangements and other family secrets of the fish, and began to lecture the poor creature on the subject; and that scarcely had he begun to speak, when the *Gillichthys* gave such a

frightful yawn, that the Professor found no difficulty in backing out gracefully. He is alive and well to-day, but the fish is a corpse. E. C.

P. S.—In sending the hook, please prepay charges.

What is it about a man falling into the pit he himself hath digged?

TORONTO GUN CLUB, *Dec.* 16*th*, 1879.

Editor Forest and Stream:—

In what follows I cannot claim to be a competitor for the prize at all, for what I am about to relate is true in every particular.

In September, 1877, we had a fearful rain storm in this vicinity, and the principal bridge over the Don was swept away by the torrent. A square-built woman, with a broad face, obtuse nose and a mouth that almost severed the upper part of the face from the lower, was trundling a perambulator, with a baby six months old in it, over the bridge at the very moment that the bridge took it into its head to emigrate down stream; and she, the baby and the family carriage went with it. The perambulator and contents soon disappeared beneath the angry flood, but a fellow with a pike-hook pulled the woman ashore before she went down for the third and last time.

The next spring, just after the ice had left our bay, a son of Ham was fishing for the fish so beloved by the ebony race, from the end of a wharf about a mile from the bridge where the woman, baby, and all went on the excursion the previous fall. Presently he hooked a large channel-cat, and being unable to land it on the wharf himself, called to his aid some valiant sons of Ireland who happened to be ballasting the railroad on the Esplanade, and the monster was drawn out. The darkey was overjoyed at the sight of his luck, but the white boys were horrified when they saw what "an ugly divil they'd saved from a wathery grave," and legged it up the wharf again in quick time, for fear he'd be "after them." The cat, finding itself out of its natural element, lashed the planks of the wharf angrily with its immense tail, when the wharfinger ordered the darkey to "get out of that with his fish in a hurry, or it would ruin his wharf." After a fierce struggle Sambo succeeded in placing his conquest on *terra firma*, when a crowd soon collected. As the fish was the largest ever seen here, a tape line was procured, when its length from snout to tail was found to be seven feet eleven and three-quarters inches (I'm not going to tell a lie for a quarter of an inch), and the measurement around its body showed exactly the same measure. In fact it was literally as broad as it was long.

Mr. Wilson, our eminent Assistant City Engineer, who has had a life-long experience with the tape-line, verified the length and breadth himself. It was then lugged over to the city weigh scales, and was found to weigh just the same as a hog. [How much is that?—ED.]

Publ o curiosity now became excited, and much to the discomfiture of our colored brother, the cat was lynched and unceremoniously ripped open by an irreverent butcher. To the amazement of the by standers, out rolled, not a shoal of little cats, but a barrel-shaped coffin, hooped together at the ends by the veritable tires of the perambulator swallowed by the Don some six months before. On the removal of the hoops out came the body of the baby. The mother being sent for, identified her long-lost darling immediately, for there were her own flat face, stub nose and diminsionless mouth, and carried it off. DEACON GILL.

N. B.—The hoops may be seen hanging up in our club-room any time you choose to give us a call.

—Here is a tradition from India. It is the account of the Deluge, as told in the *Rig Vida*, and translated by Max Müller:—

One morning water for washing was brought to Manu, and when he had washed himself a fish remained in his hands. And it addressed these words to him: "Protect me, and I will save thee." "From what wilt thou save me?" "A deluge will sweep all creatures away; it is from that I will save thee." "How shall I protect thee?" The fish replied: "*While we are small we run great dangers, for fish swallow fish.* Keep me at first in a vase; when I become too large for it, dig a basin to put me into. When I shall have grown still more, throw me into the ocean; then I shall be preserved from destruction." Soon it grew a large fish. It said to Manu: "The very year I shall have reached my full growth the Deluge will happen. Then build a vessel and worship me. When the waters rise, enter the vessel and I will save thee." After keeping him thus, Manu carried the fish to the sea. In the year indicated, Manu built a vessel and worshipped the fish. And when the Deluge came he entered the vessel. Then the fish came swimming up to him, and Manu fastened the cable of the ship to the horn of the fish, by which means the latter made it pass over the Mountain of the North. The fish said, "I have saved thee; fasten the vessel to a tree, that the water may not sweep it away while thou art on the mountain; and in proportion as the waters decrease thou shalt descend." Manu descended with the waters, and this is what is called the *descent of Manu* on the Mountain of the North. The Deluge had carried away all creatures, and Manu remained alone.

DEPOSIT, N. Y., *Dec.* 20*th*, 1879.

Editor Forest and Stream:—

I know I can never get that fish-hook unless I put off giving my story until the last moment, viz., sixtieth minute of the eleventh hour of the last day of December, but I shall send it now, and take the chances.

Two years ago—namely, on the 20th day of January, 1878—Dr. S. and myself were at R—— Pond, fishing for pickerel through the ice. The day was fine, but we had taken no fish. On the shore of this pond had formerly stood a saw-mill, with a bulkhead some forty feet high, and near it on the shore had also been a house and barn. All these had suddenly disappeared a couple of years before, and were well-nigh forgotten at the time of which I write. Well, we kept on fishing, and all the time wishing we could get a bite, when all at once we both saw a "tip-up" tip-up, and both rushed for it. We discovered that we had hooked a big one as soon as we reached it, and both began pulling at the line. We managed, after a long effort, to get him up to the ice, but then found that the hole was too small. We let him back, and enlarged it; brought him up again, and had to make i larger, until finally, to get him out, we were compelled to cut the ice all out of the pond before we had a hole large enough to pull him through, and then we couldn't do it alone, but had to tie him ot a tree, and get all the oxen in the neighborhood to help us land him. We drew him out and proceeded to cut him up in order to take him home. On opening him we found—but I'm afraid you'll think I. L. Y. when I tell you what we found—the old saw-mill, with its forty-foot bulkhead right end up, the house with the family inside, and the barn, with the horse, cow, chickens, etc., just as natural as ever, together with the pond, in which the fish had greatly increased.

We wrote to the editor of the FOREST AND STREAM asking him what we should do, and he answered, through the Correspondents' Column, "to tie his head up in a bag so he couldn't shake his ears, and give him a dose of Fowler's Solution twice a day for a week." This is a true story; at least, it is vouched for by a FISHERMAN.

DETROIT, Mich., *Dec.* 25*th*, 1879.

Editor Forest and Stream:—

One hot day in August I was "stump fishing" at Licking Reservoir, in Ohio. Stump fishing is standing in the stern of the boat, with a stiff pole and long line, while the rowsman backs the boat quietly toward stumps and sunken logs, of which the reservoir is full. When within casting distance of a likely looking stump, the minnow (which for this fishing is always large) is deftly and quietly tossed. Should your bass be there, he strikes like a flash. Only an instant is required to determine whether or not you are to find a fish. If not, off we move for another cast.

This particular day I had fair luck, and toward noon had some ten or twelve bass, all very large—averaging seven or eight pounds each. You know these reservoir or pond bass run much larger than the true black bass. It was getting so hot I concluded to go ashore, get dinner and return later in the day, and was about giving my "pointer" orders to that effect, when I saw coming toward us the largest bass that ever lived, I presume. I had frequently heard old reservoir fishermen speak of him. They even knew his weight, having once had him penned up in the canal lock where they weigh canal boats, and weighed him. This was some twenty years since, they say. Then he weighed 163 pounds. But they were never able to capture him. Well, sir, this monster was coming toward us, with mouth wide open, at a speed of twenty-five miles an hour, tearing through the water like a racing steam-tug. Dan cried out, "He is coming for us!" and started to pull for our lives. The sudden start threw me out of the boat, and I dove a distance of twenty-five or thirty feet, coming to the surface alongside a huge stump. I turned to look for Dan and the boat. They were gone! That bass had swallowed them—the boat, Dan, my string of fish, pole, line, hook, minnow, pail—all, everything. I got ashore in three seconds, and out of the county in three minutes, and never stopped until I got out of the State. They have had detectives on my track ever since to arrest me for murdering poor Dan—or to make me pay my hotel bill. I can't furnish affidavit to this, because Dan is dead; the bass ate him up.

Do you think that big fish-hook would take that fellow in? If so, send it on, and I'll superintend, from some tree-top, the job of angling for him. UNO.

No count on this. Re-entries not allowed. This is not a rifle match.

WASHINGTON, *Dec.* 19*th*, 1879.

Editor Forest and Stream:—

In 1861 I was camped on the banks of the Pecos River, in Northwestern Texas. Being the recognized fisherman of the party, I was deputized by my companions, fish purveyor, and whenever we were in the vicinity of a river I was urged to try my piscatorial skill to add to our rather deficient larder. My outfit consisted of a strong hempen line, that had done service as a wrap for a broken gun stock, and a large redfish hook attached to a strong piece of copper wire some three or four feet in length. With this crude rig I started out one bright sunshiny day in November. I baited my hook with the intestines of a blackbird, and cast the enticing morsel in the swift current of the Pecos, hoping to catch a codfish or turtle. After patiently waiting for an hour or more without even the satisfaction of a glorious nibble, I gave up in disgust, fastened my line to a root, and went back to camp. The next morning I returned for my line, and was surprised to see a coyote wolf calmly sitting on his haunches near my fishing place, and apparently watching my line. Not caring for his company, I shied a stick at him, which caused him to make a rush from me for a few yards, when he suddenly rolled over and over, howling as only a coyote could. Regaining his feet, he again attempted to run, with similar results. I supposed him rabid, and put a quietus to his anetics with a load of buckshot. Approaching him, I found that my line was down his throat, and on further investigation found that my hook and bait had first been gobbled by a catfish, then a young otter had swallowed the fish, then the coyote had bolted the otter, and the hook had caught in the throat of the wolf. Knowing that the coyote is as chary of going in the water as a cat, I was puzzled to learn how he had captured the otter, until I found the tracks of the otter where he had crawled up the bank after eating the catfish, and had then been captured by the wolf. A. R. S.

A. R. S. is declared out the race. We are all willing and bound to credit anything and everything he may tell us, so long as he sticks to the water; but when he ventures out upon dry land we shall rule it a "foul."

KANSAS CITY, Mo.

Editor Forest and Stream:—

About ten miles west of Spirit Lake, in the extreme northern portion of Iowa, lies a beautiful little sheet of water, locally known as Silver Lake. Nine or ten years ago, when the settlements began to spread outwardly from the nucleus formed about Spirit and Okoboji Lakes, an adventurous spirit named Nicholson located in a beautiful grove on the east bank of Silver Lake. Here he resided with his family for a number of years, and made a comfortable living by farming in summer and trapping in winter. He was born a sportsman, was a capital story-teller, and an entertaining host, as every one who ever partook of his hospitality will testify.

One day while skirting the lake in quest of game, Nicholson winged a magnificent pelican. It was a large specimen, and being only wing-tipped, he resolved to save it. Careful nursing and a liberal diet of fish taken from the lake soon reconciled the bird to his altered state, and eventually he became quite a pet. With restored health he was abundantly able to provide his own food and never was happier than when, after a half-hour of fishing on the lake, he came to the house with a pouch filled with bass, and squatting himself in some sunny spot, he proceeded to gorge himself upon the contents of his well-filled creel. But at last it was noticed that a change had come over him. He no longer brought fish home for his dinner, and his Aldermanic proportions rapidly shrunk away until he became a withered skeleton. Not wishing to loose his bird, Nicholson brought his rod and line to the rescue and caught scores of fish, which were swallowed with avidity, without in the least bettering the condition of the fowl. The more it ate the more emaciated it became. Nicholson fished industriously, and the bird sat on the bank and swallowed fish after fish as fast as caught. One day a fine perch was pulled from the water, and before Nicholson had time to disengage it from the hook the hungry pelican had gobbled it, hook and all. Here was a dilemma. All efforts to extricate the hook were futile. Converting his rod into a disgorger Nicholson strove to remove the hook until, in his frantic efforts, the bird was killed. Seeing that his pet was really dead, and having further use for his fish-hook, Nicholson took his hunting knife and proceeded on a voyage of discovery after that hook. Imagine his surprise at finding in the capacious cavity of the dead bird a living and lively pike thirteen and a half inches long, and inside of this pike his eight-inch perch, securely fastened to his fish-hook.

Nicholson subsequently sold out his ranch and moved further west. But the lake is still there, and if any person doubts this story they can go and see it for themselves. EROG.

"Erog" is a famous rifle shot, whose score was once at the head of the list. He always hits the bull's-eye.

NEW BEDFORD, Mass., *Dec.* 22*d*, 1879.

Editor Forest and Stream:—

While out fishing at the mouth of the Vineyard Sound I chanced to hook a large bluefish with a bone drail. While carefully pulling him toward the boat I felt something give a "jerk," and discovered I had on a larger prize. I readily found out that a striped bass had seized the bluefish, hook and all. This gave me no little trouble, and after two hours' hard struggling I at last succeeded in bringing the bass alongside, or rather under my boat, and reaching down to pick up my gaff so as to take him on board, judge of my surprise in seeing the sword of a swordfish come up through the bottom of my boat, and also through one of the hwarts, or seats. Not to be balked, I at once made my boat's painter fast around the sword, and having no lance for the occasion I, with my gaff, hooked up his tail and made that also fast to the stern of the boat. I now pulled for Gay Head (Martha's Vineyard), one mile distant, and safely landed my catch. The result was as follows:—one bluefish, weight six pounds; outside of it was the bass, weighing seventy-nine and a half pounds; while his body was transfixed by the swordfish, weighing 120 pounds, while around the body of the swordfish was a "gill," or "set" net containing forty-two mackerel. The swordfish, in trying to get at them, had passed through the net, and so took them along with him. Inside the bluefish were six menhaden, which he had eaten before taking my drail bait. If necessary I can call on plenty of brother fishermen who saw the catch. WHALER.

RICHMOND, Va., *Dec.* 13*th*, 1879.

Editor Forest and Stream:—

In the spring of 1876 I was an invited guest of the Captain on the United States steamer *Truxton*, bound for France. On our way out we encountered a wreck, which was dismantled, with nothing but the hull timbers remaining. There was no sign of the name, but on consulting the files of the Shipping Intelligence of *Lloyd's Gazette*, the Captain came to the conclusion that it was the *Betsy Jane*, lost a year before, on her way between Boston and Toulon, France, with all on board, and an assorted cargo of French toys and musical instruments.

A few days afterwards some sailors fishing from the stern caught an immense shark, which, wonderful to relate, seemed to utter from his mouth sweeter sounds, more ravishing notes, than ever came from Orpheus' harp. The sailors wanted to kill and open him, but the Captain refused and ordered a huge tank to be filled up on deck and the monster of the deep confined therein. All this time from the belly of the shark came sweet music—now fast, now slow; now an aria from "Martha;" then a gem from Rossini.

A strange fact we all noticed:—When the music played slow he swam gently in his prison. "Ah! I have sighed to rest me, of Trovatore" made him genial, but when the box played "The Devil's Dream" the tank could hardly hold him. After many hours the music changed to "Sweet By-and-Bye," and the shark's movements became more languid and slow, and when the strains of "Home, Sweet Home" were played the fish pined away; huge tears dropped from his eyes, and he drooped and died.

They opened him and found a patent back-action automatic go-as-you-please perpetual motion music box. MERCUTIO.

How utterly have we lost in these latter days the poetic faith of the wise men of old, who peopled the woods with Fauns and Dryads? Before their eyes floated Mermaids fair, and to their willing ears came the witching Syren's songs. Patent music box! Patent bosh! Give us the simplicity of the ancient mariners of the sea, who never fished with cruel hook for the sweet singers of the deep.

CYNTHIANA, Ky., *Dec.* 10*th*, 1879,

Editor Forest and Stream:—

As you expressed a desire to hear from Kentucky I have concluded to "drop you a line," hoping that you will tie the "big hook" on the end of it, or, as I am not a bit selfish in the matter, the smallest barbless or needle-point will be satisfactory.

I could duplicate many of the fish stories so far published in your columns, but I have long since ceased to wonder at the vagaries and inconsistencies of the finny tribe, and especially in regard to their gluttony and swallowing capacity. In some instances their eyes prove to be "larger than their stomachs," but I know of but one case where such a mistake proved fatal *per se*, and then "one swallow" made the last "summer" for a big pickerel. Said pickerel attempted to swallow a full-grown rock-bass, but the stout fins of the latter became firmly locked in the gills of the pickerel, and he died of starvation, as his emaciated form bore witness, leaving the thrilling narrative to be unfolded from the "tale" of the bass, which projected from his mouth.

From fishes to frogs is an easy and natural transition, and I wish to say a word about frogs—bullfrogs. Once while angling for black bass on Genessee Lake, near Oconomowoc, Wis., I concluded to catch some frogs, and soon had a mess of two dozen averaging twelve inches long, that would have delighted the heart and tickled the palate of a Frenchman, or any one else, for that matter, as gastronomically wise. While skinning them I found in the stomach of one a flat, triangular stone measuring three inches long each side and a half-inch thick. Now, was he handicapped for a swimming race or a standing jump? Or had this especial "greenback" been converted into a "sinking fund" by some batrachian syndicate?

Another frog in the same lot appeared unusually plump and puffed-up, and reminded me of old Æsop's frog that tried to emulate the bull in size, and "busted" in the attempt. Upon opening this frog I found a spotted water-snake some eighteen inches long, in a snug and compact coil, and the process of digestion had already commenced. Now I had often seen snakes swallow frogs, but this turning of the tables I had never even dreamed of. I knew that frogs were insectivorous, herbivorous and "wormivorous," but I never suspected that they sometimes got "snakes in their boots." Now, did the frog find the snake dead and so take

him in, or did the too confiding ophidian crawl through the open countenance of the wily batrachian, and thus "shuffle" off his mortal coil by a "misdeal?"

The above are facts—sober, serious gradgrinds.

J. A. HENSHALL.

This subject has proved an expansive and comprehensive one. We have allowed many competitors greater license than strict justice would dictate. Possibly others may have notes on the habits of frogs, which will find a place in our Natural History columns.

WILLIAMSTOWN, Pa., *Dec. 22d*, 1879.

Editor Forest and Stream:—

On the eleventh day of September, 1873, the writer in company with a friend was trolling on the "cannon-hole" on the Susquehanna, a few miles below our city. Our boat capsized at 10 A.M., and we lost the contents of our lunch-basket. On the 11th of September of the following year, while fishing at the same place with the same friend, we hooked and landed a wall-eyed pike, weighing 9 pounds 13½ ounces. I happened to look at my watch, and found that again the time was exactly 10 A.M. Noticing the large abdomen of the fish, we made an examination and found that his stomach contained a silver butter-knife, with my friend's name engraved thereon, and one large box of sardines, both of which articles we lost from our basket when the accident occurred the year before. Now, Mr. Editor, were I not a truthful fisherman I might—in order to make sure of your gilded prize—say that when we opened the box we found the sardines alive, ready again to swim the briny deep; but, like the immortal George, I cannot tell a lie—nay, even if I should be rewarded with a golden hook as large as the anchor of the *Great Eastern*. The fish were not alive, but, flavored with lemon juice, they made us an excellent lunch. If there should be a fisherman with soul so base as to doubt this true history, and as to insinuate that a 9 pound 13½ ounce fish could not swallow a large sardine-box, I would remind the incredulous wretch that the gullet of Prof. Gills' fish was smaller in proportion to the fish it swallowed than the gullet of my fish was in proportion to the sardine-box. Besides, my theory is that the fish first swallowed the butter-knife, to which adhered about a pound of butter, which prepared the way for the box. Furthermore, perhaps the pressure brought to bear upon the box may have been so great that a portion of the oil oozed through the pores of the tin, thus further lubricating the fish's throat. Should this not be sufficient proof, I need only add that I still have the empty sardine-box in my possession. Hoping that when you send the gilded barb you will not forget to pay the freight, I remain your truthful BOBOLINK.

ROSLYN, N. Y., *Dec. 31st*, 1879.

Editor Forest and Stream:—

I had a friend, an innocent, confiding soul. Alas! one evil day he chanced to see some late numbers of your paper, and at once became interested in the tales of "Fish Swallowed by Fish." He read them all! And what is sadder still, he *swallowed* them, became a raving maniac and wandered by the sea *in-seine*. Then was this poor man in turn swallowed by the *sole* survivor of all the fishes that had previously swallowed each other. Now, although my unhappy friend is "lost to sight," I have faith that he still lives (in *whales*), and what I want that extra large hook for, is to angle after the fish that swallowed the man who swallowed the *tales* of all the fishes that swallowed each other. QUI VIVE.

HAMPTON, Ill., *Dec. 28th*, 1879.

Editor Forest and Stream:—

The Mississippi closed here on the 18th ult. I was down on the ice and saw something underneath that seemed to be alive. I got an axe and cut it out and found it to be two catfish, whose combined weight was thirty-five and a half pounds, trying to swallow each other—tail first. They had swallowed about one half of each other, and formed a perfect circle. I took them out and supplied them with water, and now at this time (ten days) they have swallowed about an inch more of each other. The question is, after they get through will there be any thing left? H. F. T.

QUEBEC, Can., *Dec, 29th*, 1879.

Editor Forest and Stream:—

I have been a follower of the gentle Izaac, and have, when occasion offered, sought "the solitary sport." Not that I am ambitious to gain your big hook, but anxious to lay before your readers a few scientific facts. I crave a space in your columns.

Where the stream Lairet empties itself into the river now called the St. Charles, called at that time the St. Croix, or the Cabir Coubat, the indefatigable explorer, Jacques Cartier, over three centuries ago wintered his vessels within a short distance of the ancient city of Quebec, to which in the summer season so many tourists resort to find what is curious and old on this continent and so remindful of the mother countries across the water. Being an inhabitant of the city of Quebec and of archæological tastes, I wished to discover all that was true and positive in reference to the locality above mentioned, and one evening in July past I went there to pursue my studies. Armed with a tape line, I measured the distance between the mouth of the Lairet stream and the site whereon remnants of Jacques Cartier's vessels have been discovered, and also of the sight of the bornwork erected by Jacques Cartier. While looking at the water I saw in its depths a large fish of about two feet in length, which by its stolidity I discovered to be a member of the sterionidæ family, commonly known as a sucker. I might possibly have taken no further notice of it had I not been startled by the arrival of another fish on the scene, and here I may be permitted to acknowledge that up to that moment I did not credit the theory of the fish taking the fly by a rapid flop of the tail. I was then convinced of the truth of your argument, for while watching the sucker I was almost overwhelmed by surprise by the sudden approach of a pike, which by an extraordinarily clever execution of his tail sought to swallow the sucker, but unfortunately for it the sucker was at that very moment taking a long breath, and before the pike recovered from its disappointment it found that about six inches of its under part had been drawn into the sucker's body. The struggle was for a time exceedingly violent, but at length the victim succumbed to irrevocable fate. I made up my mind as soon as I saw that arrangements had been arrived at between the two combatants to capture both for scientific purposes and therefore secured a flat dish from the house of a farmer near by. By placing a couple of pebbles on my tape line I sank it just beneath the mouth of the sucker and by a dexterous jerk landed both, and then placed them in the dish of water. As soon as possible, I conveyed them home and put them in my fresh-water acquarium, the sucker at that time having drawn in about eight inches of the pike. It cannot at all be a matter of surprise, when it is considered that the vacuum in the pike, caused by the suction powers of the sucker was very great, that the pike was in a most voracious condition, and that during the two following days all my gold fish, speckle-backs, minnows and trout, were disposed of, and in the maw of the hungry pike. On the third day he had commenced to eat up my plants, such as anacharis and ranunculus, but by that time the sucker had consumed the digestive organs of the pike and very little but its gills appeared. After the consummation of the feat, I was so annoyed at the loss of the contents of my acquarium, and also by the voraciousness of the sucker that I threw it to a couple of tom-cats, which within a short time settled the fact of so despicable a fish. O.

NEW HAMPSHIRE—*Dover, Jan. 6th.*—Some fine strings of pickerel were brought to town last week by Dr. Carl H. Horsch, Geo. E. Foot, and Captain William Perkins, and others. Some fine trout have been in the market taken from Lake Winnipiseogee and Merry Meeting Pond. There are also a good supply of smelts, also eels. They are a drug in the market just now. A short time since a new turbine water-wheel was placed by the Cocheco Manufacturing Company in one of the shops. For a few days everything went well, when, for some cause unknown at the time, the wheel stopped and could not be started. On taking it apart, more than a barrel of eels were found of all sorts and sizes. One of the eels measured 4½ feet in length and 15 inches round. How the eels got there is a mystery, as at the mouth of the flume there is an iron gate. The bars of which it is made is ½-inch iron, 1½ inches wide, and braced every two feet. There is no possible way for them to get to the wheel without passing through this gate. How did the large eels get through, the bars of the grate being only one-half inch apart? W. A. Y.

ARKANSAS—*Jacksonport, Jan. 5th.*—While writing I cannot resist the temptation to drop a line to the "fishing department," even though it be to report no sport. This is on account of high water. This in Southern rivers, in some years, operates as a pretty good substitute for game laws by creating a close season. It is however, a lamentable fact that our game and fish are gradually disappearing, and that without any hope of remedy or help from legislation. SAM MONROE.

The Kennel

BEAR DOGS.

A MASSACHUSETTS correspondent who has hunted bears annually for the past twenty years, and who has promised to send us some of the fruits of his experience, is collecting a large pack for a great crusade this winter. He complains that he has been unable as yet to find just the breed of dog for a Maine bear hunt. Those he has tried before have failed to bring Bruin to bay and hold him until the huntsmen could come up. We shall look for some suggestions on this subject from our friends who have been most successful in the pursuit of bears with dogs. Those who have already detailed their experiences in these columns seem to have employed a mongrel breed of our dogs.

Bear hunting has been mostly carried on by the backwoodsmen of the North and West, and by a few gentlemen of the South. For this reason little is generally known of the *modus operandi* of a first class American bear hunt, few sporting works having devoted their pages to the description of large game shooting. We therefore have to fall back upon the books of travel and adventure for the little we know of the way the sport is carried on. These accounts are often so inaccurate and impracticable that we are either amused at their absurdities or terrified with the accounts of the hair breadth escapes and slaughter. With the novelist the bear seems to be an especial favorite; he is continually poking his nose into the story—and proving a God-send to both hero and heroine. Even George Sand, in the novel of the Snow Man, describes very accurately how the bear of Norway is tracked to his lair and killed.

In Northern Europe the bear is seldom hunted in winter with dogs, the hunter more often following it on snow-shoes, or awakening it in its den and shooting or stabbing it as it rushes forth. Here in America the bear of the South and Southwest is almost exclusively hunted by dogs, a cross generally of the large slow fox hound with the mastiff. We should think, however, that curs who "bark when their fellows do" would answer well in bringing the bear to bay.

The following extract from an article on bears and bear hunting, taken from Porter's "Hawker on Shooting," tells more in a few lines concerning the dogs used for the sport than any article we have ever read. The graceful narrator, H. J. P., Esq., of Sicily Island, Louisiana, certainly shows that he knows whereof he writes:—

The description of dogs that are preferred for bear-hunting, is a cross of the hound, bull and cur dog. This cross is very generally admitted by the old bear hunters of Arkansas and Louisiana to be preferred for several reasons. This mongrel has, in a great degree, the fine nose and bottom of the hound, with the speed and fierceness of the genuine cur. Now, the term "cur," is very vague and indefinite, and is applied to many varieties of dogs. The dog we allude to is an active dog, of a yellow color, a pointed nose, an ear that is partly erect and partly dependent—a watchful, sprightly guard dog. This half-breed, crossed again on the bull dog, produces a heavier and more powerful dog. The full bred bull dog makes but a very indifferent bear dog; he cannot smell well, and of course is no hunter. He is a slow runner, and when he comes up with a bear he seizes hold of it, and the bear kills it as quick as thought; and even if disposed, he has not sufficient activity to get out of a bear's way; when the bear makes a charge upon the dogs, the same objection that applies to the bull applies to the bloodhound.

A gentleman on Little River, in our parish, who is quite an amateur of bear hunting, concluded he would get him a pack of bloodhounds, and would force the bears to come to a stand forthwith. He accordingly raised and obtained nine of them. He started with another acquaintance on a hunting excursion on the Tensas River, a few miles distant. The first bear he happened to start was a very large he-bear. The bloodhounds soon came up with his majesty, who gave them a very warm, but rough reception. The bear came to bay in a very extensive cane-brake, where a footman could make but slow progress, in consequence of the drifted and tangled cane, hence not one of the hunters was able to come up in time to get a shot; in the meantime the bloodhounds fought with the fury of devils; but the bear killed and crippled seven out of the nine in a few minutes; breaking the shoulders and backs of some, and tearing out the bowels of others—serving some with his teeth and clipping others with his claws; for, although the claws of a bear are very blunt, when compared with those of our Louisiana tiger—called by the naturalists "*cougar*"—still they are used with such power when he makes his passes, that if a dog comes within the reach of them, one rake will tear out his bowels or break his bones—for the bear is a scientific boxer.

We are under the impression that the Scotch terrier would make most admirable bear dogs in our cane-brakes. He has courage, speed and a good nose; he has action in a high degree, and the smallness of his size would enable him to get out of a bear's way whenever the bear would attempt to strike—when, on the contrary, a larger dog could not dodge from the bear in consequence of the thickness of the cane. An experienced bear dog will nip the hind quarters, and as the bear stops to make a pass at him, he will retreat and hold the bear at bay, and as soon as the bear turns to retreat, will again seize him, and almost as soon dodge aside to evade the claws of this gigantic animal; for, reader, you must know that an old he, that weighs about five hundred pounds, has the strength of an ox, and a dog in a bear's reach stands no more chance than a mouse in the claws of a cat; and in bear hunting the old adage holds remarkably true—that

"He that fights and runs away
May live to fight another day."

TREATMENT OF DOGS.—Our friends who may receive advice through our Answers to Correspondents, as to the treatment of their sick dogs, are requested to communicate to us the result of the prescriptions and methods there given.

ST. LOUIS KENNEL CLUB'S NEW IMPORTATION.—The steamer *City of New York*, of the Inman Line, which arrived here on Saturday morning last, had on board a fine white and liver pointer bitch from the kennel of Mr. S. Pilkington, Widnes, Lancashire, England, for Mr. C. H. Turner, of the St. Louis Kennel Club. The dog was consigned to Mr. E. B. Goldsmith, of 58 Wall street, the well known Custom-House and Forwarding Agent, through whose hands so many of our crack dogs have passed during the last five years. In despite of the unusually rough voyage, the bitch, although very large with pups, arrived in splendid condition. Mr. Goldsmith superintended in person the transfer of this fine animal from the ship to the cars of the express company, and no doubt, by this time, the dog has reached her future home. In our next issue we shall endeavor to give full particulars about her.

FECUNDATION AFTER SPAYING.—*Dec. 30th*, 1879.—In the last number of FOREST AND STREAM a correspondent quotes the case in which a bitch spayed for Prof. T. G. Thomas afterwards gave birth to pups. I have had the same accident occur, and have no doubt that in this case a third ovary, or separate and unnatural portions of the normal ovaries, existed in the broad ligament, and in such a position that they would be overlooked by the surgeon. The bitch in question belongs to Mr. H. Clark, of Ithaca, N.Y., and has given birth to seven pups (one litter). That her two ovaries were removed entire, I am certain, as I took especial pains during the operation for the purpose of showing several persons who were present at the time, and made sections of the two to demonstrate their structure.

The dog is a valuable one, otherwise I should have procured her and made a post-mortem examination. She will probably continue to œstruate and bear pups just as though she had not been spayed. Such cases are probably very rare; they are at least seldom reported, and the operator cannot be on his guard against freaks of nature. MARK WEST.

If the ovaries were removed as thoroughly as you say, we very much doubt her ever having a second litter. It must be remembered that the dog's œstrum occurs only about twice a year, and it is possible that her condition at time of spaying was physiologically such as to permit of oval fecundation. The similar operation upon the opposite sex has often left the power to procreate once—at least it has been so reported.

MR. A. H. MOORE'S KENNEL BURNED.—The following letter, received from Mr. Moore, tells briefly of the fire which occurred a few days ago in a section of his kennel. The fire is supposed to have originated near the heating apparatus in the section of the kennel occupied by the brood bitches. We regret very much to hear of Mr. Moore's loss, but congratulate him that none of his most valuable dogs were burned. Dart was in one of the puppy kennels, but was taken out before the fire reached him:—

PHILADELPHIA, *Jan. 13th.*

Editor Forest and Stream:—

The fire which destroyed part of my kennel broke out in the hospital, and extended further to the puppy kennels, etc. The loss amounted to $1,200, fully covered by insurance.

I had burned in all about ten dogs and nine puppies: Gordon bitch Charm, by Grouse, out of Dream II.; Bessie, English setter, and three puppies by the Laverack Dash; bull terriers, Deaf Burke and Rose; sky-terrier Billy; Italian greyhound Shadow; red Irish puppies Shamrock (Berkeley Dash-Lulu), and Countess (Elcho-Loo II.); imported cocker bitch Cicely and seven puppies; two bull terrier puppies by Deaf Burke, out of Rose.

I shall start at once rebuilding. A. H. MOORE.

EASTERN FIELD TRIALS CLUB.—A meeting of the Eastern Field Trials Club was held Tuesday evening at the office of the Ditmar Powder Company, Park Place. The election of officers for the year 1880 resulted as follows: President, Dr. H. F. Aten; Vice Presidents, Messrs. C. Du Bois Wagstaff, J. G. Heckscher, Horace Waldo, H. N. Munn, Shepard Knapp, L. H. Billings; Treasurer, G. C. Colburn; Secretary, Jacob Pentz; Executive Committee, Messrs. G. L. Lorillard, Frank Palmer, Shepard Knapp, J. G. Heckscher, T. Emmett, Charles Banks, W. Wynn, F. M. Hall, W. A. Coster, Jacob Pentz, Travis Van Buren, Benjamin De Forest, August Belmont, Jr.; Martin Van Buren, General E. B. Grubb, Horace Waldo, H. N. Munn, P. H. Morris, G. C. Colburn and J. Von Lengerke. The advisability of limiting the number of members to 100 was laid over for consideration at the next meeting. Mr. G. C. Colburn, Dr. Aten, Mr. W. A. Coster and Mr. Jay each proposed several well-known gentlemen as members, all of whom were duly elected, and the membership is now exactly 100.

On motion it was resolved to make the initiation fee for and after the year 1881, $10; the yearly dues to remain as at present, $5, to be paid on or before Sept. 1st of each year.

The following committees were then appointed by the Chair, each committee to report to a meeting of the club on the call of the President:—

For the Revision of the By-laws—Messrs. G. C. Colburn, Jacob Pentz, and Dr. H. F. Aten.

For the Framing of Rules for Governing the Running of Dogs at all Field Trials—Messrs. J. Von Lengerke, L. H. Billings, F. F. Anderson, W. A. Coster, and Edmund Orgill.

BULL DOGS.—*St. Leonard, Quebec, Dec. 29th.*—I was much amused last week by the account of Mr. Rivers-Wilson's bull dogs, and quite agree with his opinion that this valuable breed of dogs is not justly appreciated. I have had considerable experience with dogs, principally with setters, but have owned and reared several bull dogs, and from what I know of their disposition, I can say that Mr. Wilson does not overrate their good qualities in the least. I am a true lover of the dog, from the beautiful, intelligent, high caste setter, down to the "yellow dog" with the curly tail, and I must admit that, with the exception of the pug, it is hard to like a curly tailed dog. I make of my dogs, companions, and am amply repaid by the affection they give me in return. Many people look upon any dog as being "only a dog," and a fit subject for a kick or a rebuke. To such persons no doubt a bull dog is a "thing of terror," as it is not safe to kick him, and he is not to be frightened by hard words. Bull dogs come in for more than their share of abuse; they are called ugly, vicious, treacherous, sullen, stupid brutes, but I appeal to all who have had any experience with the breed to say whether they have not found as much intelligence and affection in the bull dog as in any other breed of dogs, without exception. Ugly they may be; that is a matter of taste. When properly trained as puppies, they are not vicious; they are only sullen when made so by ill treatment; and stupid they certainly are not. Easily excited, they are hard to control when they have once decided to "go" for anything, but all the tales about their turning against their owner, I quite disbelieve. No doubt if a man is a stranger to his dog, the dog will treat him as such. Most bull dogs are kept too much confined, too highly fed, and not treated as pets enough. Such treatment naturally brings out any savageness in the dog's disposition. Any other dog, treated in a similar way, will be quite as savage, but without the ferocious bravery of the bull dog. As a swimmer the bull dog cannot be beaten, for he will unhesitatingly plunge into the coldest water again and again, or breast the most rapid current. I could write all day in praise of my favorite breed, and if you will allow, at some future time, will give instances of affection and intelligence that I have myself noted. In conclusion I will only say to all who want to try keeping dogs: get a good bull dog puppy, and if you treat him properly you will find the bull dog to be clean, quiet, affectionate, kind to children, brave, and undaunted in defense of his friend. HEMLOCK.

We shall hope to hear further of Hemlock's dogs, although we foresee no sudden rise of favor for this breed.

THE BULL DOG, "GAMBLER."—*La Belle Sauvage Yard, Ludgate Hill, E. C., London, Jan. 1, 1880.—Editor Forest and Stream*—Sir: I see from an advertisement in your paper that I am credited with having said that the bull dog Gambler was the most typical specimen of the breed extant. I never did anything of the sort. I gave him first prize and medal at Bath in 1877, but the remarks attributed to me are incorrect. My only motive for writing this is, that having been pretty successful with bulldogs I don't want it to be thought on your side of the pond that Gambler was, is, or ever will be the most typical specimen of our national dog, in the opinion of

Yours truly, VERO SHAW.

We cheerfully allow Mr. Shaw to make such a correction of any misrepresentation as he may have unwittingly been subjected to in our columns.

ARKANSAS SQUIRREL DOG.—*Jacksonport, Ark., Jan. 3d.*—The usefulness of a squirrel dog depends on where the squirrels are feeding. If in trees on nuts not yet fallen, or buds, or young shoots, a dog is something more than useless—he is in the way, and by his noise and antics keeps the squirrels from moving about freely. At such times the hunter has very little difficulty in finding his game without a dog. If they are feeding upon the ground upon fallen nuts or roots of plants, whether in cane-brake, thicket, or open woods, then the dog is senior partner. He either trails or jumps his squirrel and puts him into the first tree, not giving him time to select the one with his hole or hiding place in it; then hunter and dog go pell-mell for that tree. The dog gets there first; the squirrel, of course, gets on the side of the tree away from his pursuers; the dog passes around and gives a few sharp barks, which generally sends the game back to the hunter's side of the tree, who, if he have a quick eye and obedient hand, makes short work of it. If not, the squirrel passes up the tree out on the longest limb and off to another, and so on, until the tree containing his hiding place is reached. And here again the dog comes to the front, by faithfully informing his master, by an unmistakable sign of language, up which tree the game may happen to be at any given time, so that very good running shots are not unfrequently secured by the help of the dog that might not otherwise be had. To the ardent and not over fastidious sportsman, there is worse fun in the world than shooting squirrels over a good dog. If game is comparatively scarce, or the day unfavorable, the dog will not unfrequently range far ahead. When he trees his game, he will usually let his master know by loud and frequent barking. That is a slow sort of sport, but better than none.

As to the breed, that is not important—a common cur may turn out as well as any. The best I ever had, or saw, was a black and tan terrier. I had a pointer that was all that could be desired, except that he would not bark. Unlike the practice of running rabbits, squirrel hunting does not seem to demoralize bird dogs in the least. Cockers would no doubt do splendidly. It is not however the breed, but the qualities that are to be desired—these are a good nose, a quick eye, and a love of the sport. Given these, and a little practice will do the rest.

NOAH COUNT.

If any correspondent has an older claim (better there is none) to this *nom de plume* let him now speak, or forever hold his peace. We are awaiting the experience of others, as to the best dog for squirrel hunting.

RAY—*New York, Jan. 3d.—Editor of Forest and Stream*:—My English setter dog, Ray, was bred by Charles H. Raymond, Esq., of Morris Plains, New Jersey, (now President of the National American Kennel Club), by his celebrated imported Laverack, Pride of the Border, out of his native bitch, Dimity, and was chosen, as pick of the litter, by Mr. Edmund Orgill, at the Springfield, Mass., bench show, in the spring of 1876, the pup being then just weaned, and having been offered as a special premium, by Mr. Raymond, for the best Gordon setter. Mr. Orgill won this premium, and in due time placed Ray in the hands of Mr. Geo. W. Wimford, of Germantown, Tennessee, who put him through a special course of training, and he has since been hunted by Mr. Orgill. Ray was not exhibited until the Westminster Kennel Club's show here last spring, where he took "V. H. C.," in a class of sixty-six dogs, first prize going to his half-brother, St. Elmo. He subsequently visited the Philadelphia and Boston shows, gaining a first prize in each, in classes of forty-nine and thirty-nine respectively. After the Boston show, Ray was left for some time in charge of Mr. Rogers, the well-known artist, who desired to paint his portrait, and I presume that he has now done so.

Among the progeny of Ray, are Repton, owned by J. J. Pettit, Esq., Galveston, Texas; Katie, owned by H. McComb, Esq., Memphis, Tennessee; the fine young dog, Stanley, who was so highly admired at the show here last spring, owned by Alfred Schnable, Esq., Short Hills, N. J., and King Edmund, owned by S. J. Martenet, Jr. Esq., of Baltimore, Md. The two last mentioned dog is said by his breaker, Mr. C. A. Gladson, to be the best natural retriever and thorough field dog of a dozen good ones handled by him during the past season. Having recently purchased Ray from Mr. Orgill, and advertised "in the stud" in your paper, I hope to aid in supplying sportsmen who are possessed of fine bitches with stock at once pleasing to the eye and having, in a high degree, the proper field instincts. HENRY W. LIVINGSTON.

NEW HAMPSHIRE FOX HUNTING.—*Dover, Jan. 6th.*—A few days since a nice little fox hunt took place on the outskirts of our city, which for amount of game for the time taken in getting it, has not been beaten around here this winter. The hunt commenced at about 9 A. M. and finished at about 3 P. M., and resulted in taking two foxes. The hunt was headed by that fine old dog, Danger, who has no superior and few equals. He is owned by Capt. J. S. Dame, at whose instigation the hunt was gotten up. The trail was very hard to follow, as for the most part of the time it was on ice or frozen snow, and but little scent was left. Not once was the old dog at fault. One of the foxes killed has been run several times by different dogs and has always escaped, but in Danger he found his match. Long live old Danger!

W. A. G.

NAMES CLAIMED.—Mr. E. F. Wells, Morton, Pa., claims the name of Lulu for his black bitch whelped March 13th, 1878, out of his bitch, Black Maggie (Bessie-Dick Connolly), by Smie's (Phila.) Dash.

H. L. Gates claims the name of Brant III. for his black and white Irish Gordon setter, sire Bob (Plunkett-Fan), dam Tip (Godspeed's Brant, Worthington-Kate).

Mr. E. S. Root, Pottstown, Pa., claims the name of Flake for his pointer puppy, whelped April 28th, 1879, from the kennel of Van Cent, Md., by Flake, grand-dam Hart.

The name claimed by Mr. C. M. Bryant, of Boston, for his black dog pup, bred by G. A. Strong, West Meriden, Conn., in paper of the 28th ult., is Dark.

Mr. R. H. Gillespie, of Stamford, Conn., claims the name of Joe Jr.'s Son for his Joe Jr.-Fannie pup, bred by Mr. Geo. W. Campbell, of Tennessee. This is the only Joe Jr. pup north of Tennessee. Joe Jr.'s Son will be run in the Puppy States on Robin's Island next fall, and if he is half as successful in the field as his celebrated sire he will be a hard one to beat.

SALES.—*Lass O' Lowrie.*—Mr. L. H. Smith, of Strathroy, Ont., has disposed of his little bitch, Lass O' Lowrie, winner of the Free For All Stakes at the late Patoka Field Trial, to Mr. A. M. Moore, of Philadelphia.

Rob and Feather.—Mr. Theodore Meyer, of Jersey City, N. J., has sold to Mr. Henry W. Livingston, of New York, his two cocker spaniels: the dog Rob, by Snip out of Flora, and the imported bitch, Feather, winner of the first and special prizes, New York, 1878, first New York, 1879, and second Philadelphia, 1879.

Rose.—Mr. Edmund Orgill, of Brooklyn, N. Y., has sold his champion pointer bitch, Rose (Flake-Lilly) to Mr. A. H. Moore, of Philadelphia.

Mr. A. H. Moore, of Philadelphia, has purchased (by telegraphic message) the three setters, County Dan, Roderick, and Nora, of Mr. J. Cunnington, of Brentford, at their advertised price, which was £220 for the three.

The Monview Kennel Club has purchased the pointer, Count Rocket, by Count Wind-em, out of Norma, of Mr. Llewellin.

The St. Louis Kennel Club has purchased the brood bitch, Leda, of Mr. Llewellin.

SALES.—Mr. H. L. Gates, Brookfield, N.Y., has sold his promising young foxhounds, Sport and Sancho, to H. P. Denison, Saginaw City, Mich.

WHELPS.—*Clare.*—Mr. D. B. Bosworth's cocker bitch Clare (Nimrod-Gip), whelped Dec. 17th, three dogs and three bitches, by Mr. W. B. Goff's imported Dandy.

Gipsie.—Mr. G. W. Bassford's red setter bitch, Gipsie, whelped, Jan. 1st, seven puppies, five dogs, and two bitches, by Rory O'Moore. All of the puppies are very deep red.

WHELPS.—*Detroit, Mich., Jan. 3d.*—Capt. W. H. Littleton's English setter bitch Pat (Royal George-Bell) whelped Jan. 1st eight puppies—five dogs and three bitches (four since died), by L. F. Whitman's Rattler (Rob Roy-Pickles).

Jersey City, N. J., Dec. 30th.—Mr. Vermilye's pointer bitch Dutchess II. whelped three puppies, sired by Mr. W. F. Steel's Glenmask.

PRESENTATION.—Mr. Charles E. Lewis, of Suspension Bridge, N. Y., has been presented with a very fine setter, by Mr. L. H. Smith, of Strathroy, Ont. The puppy is by Gladstone, out of Mr. S.'s bitch, Mersey.

VISIT.—The Montclair, N. J., Hunt's stud beagle Rambler visited last week Gen. W. B. Shattuc's beagle bitches Bessie and Lill.

Cricket.

SCORES OF OVER 100 MADE IN AMERICA.

The following is a list of centuries made in the United States and Canada up to the present time:—

1844—James Turner, Camden	120
1855—T. Sams, New York	114
1857—W. S. Newhall, Young America	105
1869—Martin McIntyre, Germantown	116
1872—W. G. Grace, Gentlemen of England	142
1874—Captain N. W. Wallace, Halifax Garrison	158
1874—A. W. Page, Colborne	101
1875—F. H. Taylor, Dorian	102
1875—R. S. Newhall, Young America	103
1876—Joseph Hargraves, Germantown	164
1876—John B. Large, Germantown	108
1876—H. C. Simonds	106
1876—D. S. Newhall, Young America	106
1876—S. Law, Merion	103
1876—H. J. Campbell, Trinity College School	103
1876—C. J. Ottaway, Hamilton	102
1876—R. S. Newhall, Young America	101
1877—R. Leish, Hamilton	2-2
1877—A. Marsh, St. George's	127
1877—H. C. Simonds, Port Hope	150
1877—John Hargraves, German Town	104
1877—J. W. B. Whetham, Staten Island	114
1878—F. L. Baily, Merion	115
1878—C. Bannerman, Australia	125
1878—C. M. Clark, Young America	101
1879—E. H. Moeran, St. George's	102

In addition to the above:—J. W. Hector 113, and J. Brunel 110. We are, however, without the year in which these scores were made.

AVERAGES FOR 1869.

GERMANTOWN CRICKET CLUB.

The Germantown Cricket Club of Philadelphia, played during the season nine first eleven matches, winning seven and losing two. The club scored in ten innings a total of 1,405 runs, being an average of over 14 per wicket, their opponents in twelve innings securing 902 runs, an average of nearly 8 per wicket.

The second eleven played nine matches, winning six and losing three, scoring in the aggregate 996 runs—an average of about 9 per wicket, their adversaries scoring 763—an average of about 7 per wicket. All things considered, the season was fairly successful, although it is much to be regretted that the club was unable to return more of its match debts at points like New York, Staten Island and Baltimore.

Through the courtesy of Mr. Henry W. Brown, the club's secretary, we are enabled to give the detailed batting and bowling averages, which are as follows:

SUMMARY OF MATCHES.

First Eleven.

Date and Place.	*Sides.*	*First Innings.*	*Second Innings.*	*Total.*
May 10th, Nicetown	Belmont	41	45	86
	Germantown	177	..	177
Won by one innings and 91 runs.				
May 24th, Nicetown	Germantown	107	..	107
	Merion	61	..	61
Won on score of first innings by 46 runs.				
May 30th and 31st, Nicetown	Young America	128	77	205
	Germantown	78	57	135
Lost by 70 runs.				
June 21st, Nicetown	Philadelphia	150	..	150
	Germantown	80	..	80
Lost on score of first innings by 64 runs.				
June 26th, Nicetown	Germantown	186	..	186
	Dorian	97	..	97
Won on score of first innings by 89 runs.				
July 2d, Nicetown	Baltimore	118	..	118
	Germantown	204	..	204
Won on score of first innings by 86 runs.

PATERSON CRICKET CLUB.

The Paterson Club, of Paterson, N. J., played during the past season ten matches, of which, it won five and lost five. This is a good record when all circumstances are taken into consideration. The following are the batting averages of members who played in not less than three matches. Unfortunately, the bowling analysis of all the matches were not kept, which prevents a correct table of bowling averages from being given:—

BATTING AVERAGES.

Names.	Matches.	Innings.	Runs.	Most in an Innings.	Most in a Match.	Times not out.	Average runs per Innings.
W. Brewster	7	12	113	*13	23	2	11.3
F. Bullock	6	11	121	31	59	0	11.02
G. Hozsey	4	6	37	29	29	2	9.1.
N. Graham	8	13	101	38	38	3	7.10

Answers to Correspondents.

☞ *Correspondents who may send us their proper name and address will always receive prompt attention in these columns. We require a man's name for two reasons: (1) sometimes as a guarantee of good faith, and (2) always as a matter of common courtesy. As a rule we do not reply to inquiries by mail, except in cases demanding immediate advice.*

J. O. B., Boston.—Send full address. Letter for you.

W. T. E., Boston, Mass.—The address of Horace Smith is 31 Park Row, New York.

SPORTSMAN, Washington.—The terrier you describe is probably of the Yorkshire breed.

G. H. W., Missouri Valley, Ia.—We have no record of the longest standing jump ever made.

W. D. T.—Book on boat and yacht building referred to will not be published before spring.

J. A. P., St. Louis, Mo.—We know nothing of the rifle. The Winchester is what you want.

R. M., New York.—See list of winning yachts this week, and forward addition if you have any.

H. C. W., Philadelphia.—Are there any Gordon setters white and black? Ans. Yes, plenty of them.

GROUSE, Pottsville.—M. H. Keyes, Indian Orchard, Mass., would be pleased to communicate with you.

E. G., Philadelphia.—We have no copies of the rules requested, but will procure and send them to you.

F. H. W., Saratoga Springs, N. Y.—1. Your subscription may begin with Aug. 1st, 1879. No discount for back numbers.

RUNNER, Albany.—For speed of ice yachts, see our files of last winter, or very able article recently published in London *Field*.

INQUIRER, Philadelphia.—You will find the Bonehill gun advertised by Hartley & Graham on our cover. Write to them.

UNKNOWN, New York City.—The "pheasant" of the Southern States is the partridge of the Northern States, *i. e.* ruffed grouse.

T. M. B., Mount Airy, N.C.—Ferguson's jack and boat lamps are just what they are represented to be, and will give you full satisfaction.

C. H. A., Belleville, Ill.—The cut, No. 5, in the advertisement of the hammerless gun, represents the hammer attached to the tumbler.

C. R., Philadelphia.—1. Ernest Ingersoll's address is 259 York street, Jersey City, N. J. 2. Batty's "Practical Taxidermy" costs $1.50.

W. A. H., New York.—Learn to shoot well with your left eye closed as it is naturally, when you sight. Do not try to shoot with both eyes open.

F. W. G., New York City.—Luke W. White, of Bridgeport, Conn., owns the deerhound Stanley. He can give you the information you need.

J. S., Baltimore, Md.—Althorpe's Map of Florida is the best published, and will give you all needed information. Write to Drew, publisher, Jacksonville, Fla.

R. T., New York.—You may have an opportunity to attend shooting matches by applying to the Jersey Heights Gun Club. You may address the secretary through this office.

C. S. S., San Francisco, Cal.—Please inform me the cause and cure for a kind of weakness in the hind legs of my dog. He is about six months old. Ans. Not described in detail sufficiently.

H. H., Pittsburg, Pa.—We believe that the gun is no longer in the market. It may be that those who have it do not command the capital to carry on the manufacture. Besides a better gun can be bought for the money.

F. N., New York.—I am going West for a few months' shooting What repeating rifleshall I take? Ans. We should advise you to carry a Winchester; it will give you full satisfaction. We do not recommend the other rifle you mention.

A. B. C., Boston.—*Yolands* is 32 feet on deck, 27 feet water line, and about 23 feet keel; 7 feet beam; 5 feet 6 inches hold. Herreshoff has built no sailing yachts of late and we do not know whether he is still in the business. Better write to him.

BEAGLE, Granby, Conn.—1. We do not believe in breeding in. 2. A. Belmont Purdy, 43 Beaver street, New York City. 3. The names of the first prize foxhounds in couples, at the last Westminster kennel show were Life-Guard and Favorite.

H. C. J., South Lake Weir, Fla.—Dew-claws should be removed when the animal is very young. Use a pair of sharp scissors, first dividing the skin, and drawing the dew-claw to one side before it is detached, in order that the skin may afterwards cover the wound.

J. P. S., Rockville, Ind.—Does the Government pay scouts a salary? Ans. Yes. For full information, write to the War Department. We are always pleased to receive descriptions of hunting excursions when concisely written by men who have been on the ground.

A. C. B., Fairmount, Tenn.—1. Jonathan Darling, Lowell, Me., will supply you. 2. The bicycle, we believe, will ascend almost any road practicable for horse and wagon. For further and explicit information about it, write to Charles E. Pratt, 40 Water street, Boston, Mass.

SPORT, New York.—Your dog has the mange. Powdered bicarbonate of potash, one ounce; powdered white vitriol, one-quarter ounce; sub-sulphur, two ounces; lard, eight ounces. Mix and rub well into the skin. Give your dog plenty of exercise and healthy diet.

W. H. P., Seattle, W. T.—Does it ruin brass shells to heat them red hot? I've just had the misfortune of having mine pass through a fire. Ans. You have probably already discovered that the shells do not fit your gun, but there can be no further injury, as the heating cannot harm the metal.

R. H. W., Newton, Kansas.—Please inform me if you know of any successful way of trapping wild geese either on sand-bars or feeding-ground. Ans. We know of no method that has been successfully practiced; but with care and patience we should think that they might be taken in the grain fields.

A. W. S., Minn.—The shaking of your bitch's head and gathering in her ears are caused by canker. Wash out with syringe, using castile soap and tepid water, and pour in once each day diluted lead water, which hold there for a minute. To prevent the flaps of the ears from shaking, tie a cap over the dog's head.

L. P., Adiar.—If your boat is small or of light build, caulk with cotton wick into the seams with a blunt chisel or similar tool, then putty and paint. If of heavy build, caulk with "oakum," taking care not to drive it through or spring the fastenings. Pitch seams in large vessels, scrape off and paint. Possibly filling and soaking your boat may do; the swell of the wood may be sufficient.

G., Flushing, L. I.—I find that my pointer puppy, three months old, is troubled with crooked legs—both the fore legs turn in What shall I do for them? Ans. We presume that you have been kennelling your dog in a barrel; this will crook any young puppy's legs. All young dogs should have perfect freedom, and never be tied up.

CAMPER, Woonsocket, R. I.—1. There are none of the Osgood folding boats on sale in New York. Write to Osgood & Chapin, Battle Creek, Mich. Coughtry's collapsable hunting boat, somewhat after the same plan, may be seen at John P. Moor's, agent, Broadway, N. Y. 2. Send to Chas. W. Farrar, Boston, Mass., for Guide to Rangely Lakes,

J. P. P., Boston.—Is it best to leave the hammers of a breech-loading gun, with rebounding plungers, down on plungers or at half-cock? I mean when the gun is at rest in the house. Ans. If your gun has rebounding plungers, it is impossible for you to leave them down. If it has not rebounding plungers, draw the load and leave the hammers down.

AIX SPONSA, Rushville, Ill.—If your dog has worms, there is no better remedy than areca nut. The nut should be newly powdered. If full-grown pointer or setter, after fasting twelve hours give thirty grains of nut in the evening, followed next morning by similar dose; two hours later, half ounce of olive or castor oil. If puppy weighing about ten pounds, after six hours' fasting give doses of ten grains of the nut, followed by one-quarter ounce of oil.

C. E., New York.—How long will birds keep after being injected with carbolic acid? Also, is it better to use the clear acid or have it diluted with water; if so, in what proportion of water do you use to the acid? Does it injure the plumage to use it? Ans. Birds injected with carbolic acid diluted with water one-half, will keep for a long time. The carbolic acid does not injure the plumage particularly, but such specimens are apt to become greasy after a time, and are not desirable cabinet specimens.

WM. A. ALLEN, Fort Custer, M. T.—1. Where can I get full-blooded, dark Brahma eggs, and would they hatch after being shipped to Fort Custer by river? 2. What is a choke-bore in guns? 1. Write to *Poultry Bulletin*, Hartford, Conn. Dunn & Wilbur, who advertise in our columns, may have them. 2. A choke-bore gun is so made that the diameter of the bore at the muzzle is less than the diameter of the bore behind it—or, in other words, the bore is constricted near the muzzle.

CANADIAN, Montreal.—When was the St. George's of New York originally started? Can I also trouble you to give the date and result of first Canada vs. United States match? Ans. The St. George's Cricket Club of New York was organized in the winter, of 1839 and '40. Cricket, however, was played in New York in 1751, revived in 1799, and again by the Dragon Slayers, as above The first match between Canada and the United States was played at Harlem, N. Y., August 24th and 25th, 1853. Won by the States by 34 runs.

S., Montclair, N. J.—Two of my six imported greyhound puppies were suddenly seized a few days ago with weakness in their back and hind legs. If I attempt to stand them on their feet they suffer pain, but if resting on their sides seem comparatively easy. What shall I do to relieve them? Ans. Your puppies have some spinal irritation, which is common. No active remedies are admissable at their age; a little castor oil in milk to clear the intestines may do good—time will probably put them all right.

W. J. P., Danbury, Conn.—What shall I do for a dog that has taken the distemper? This disease is very prevalent in Danbury, several valuable dogs having died with it. The disease attacks the throat and is accompanied with a drooping at the mouth; the dog cannot swallow and dies in a few hours. Some lose power in their hind legs. We opened one dog's throat, and it was much inflamed and swollen. Ans. No specific for such cases; they require systematic treatment, which must vary with each case according to symptoms. When the throat is much affected, chlorate of potash in fine powder is good. Five grains every hour.

GUN SHY, Paterson, N. J.—I bought a Bonehill $15 shot gun, and after three weeks the lump fastening the fore-end came out; was afraid to use it again; exchanged it, giving $20 for a plain twist Parker. On trying this next day discovered a flaw half way in left barrel, through which the oil or gas oozed. Returned it and got another, and I discovered that there is a flaw about five inches from the breech inside the right barrel, with a smaller one fourteen inches from the breech on the outside. Neither leaks. Ans. You might have had the Bonehill repaired at a trifling cost, or without charge by the party from whom you purchased it. In the guns of the grade you have now there is always liability of some such slight flaw. Your second gun would have lasted a lifetime, so far as the flaw was concerned; and in the gun you have now, the flaw can affect neither the shooting qualities nor the safety. Better be satisfied until you can afford a more expensive one.

W. M., Washington.—I have two bitch puppies, born about the last of September, 18'9. Until the end of November they appeared to be perfectly healthy. When brought to me about a week later I found that they could hardly walk; their hind legs were drawn forward, and the fore legs unable to hold their weight, and in a few days they lost entire use of them. For a long time they could only eat their food while resting their heads on the dish and taking the food in the side of their mouths. They ceased to grow until about a week ago. They have now improved so far as to be able to stand alone, and hobble a foot or two. If excited by hunger or eagerness, instead of going toward their food they totter backwards, as if their limbs were reversed. I have treated them for worms, but found no great number. During the few cold days in November they were not properly cared for, and were much exposed. They are black cockers of a very healthy stock. Their appetite is good. Their food has been milk and bread, mostly corn bread. Can you suggest a proper treatment? Ans. The symptoms accord with those of "inanition" from neglect and exposure. Proper care in the matter of kennelling and feeding may restore them, if not, nothing else will.

☞ CHARLES HALLOCK, having closed his connection with the Forest and Stream Publishing Company, may now be found at his office at 61 Broadway, room 23, where all personal letters and communications should be addressed.

FOREST AND STREAM
ROD AND GUN

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

FOREST AND STREAM PUBLISHING COMPANY.

—AT—

No. 111 FULTON STREET, NEW YORK.

[POST OFFICE BOX 2832.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Advertising Rates.

Inside pages, nonpariel type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial column, 50 cents per line—eight words to the line, and twelve lines to one inch.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

***Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, JANUARY 15, 1880.

To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith and be addressed to FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. Anonymous communications will not be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of mail service if money remitted to us is lost.

☞ Trade supplied by American News Company.

—Our colored posters are universally acknowledged to be the most tasteful things of the kind published. We have opened a special ledger account for our canvassers and each one may be assured of credit for work done. The mails are bringing in responses to our liberal offer far beyond our most sanguine expectations. The increase in the number of subscriptions is extraordinary, scores of names coming in daily from all parts of the country.

—Some of our cousins across the water are comparing notes on big bags of game. The man who is at the front so far seems to be a yacht Captain of Portsmouth, who scored 323 oxbirds (or stints), twenty-one stone plover and four gray plover, a total of 348 head. These were killed at 180 yards with an eight-foot gun, one and a-quarter bore, loaded with a wire cartridge containing eleven pounds B shot, one and three-quarter ounces large grain powder.

—Bicycling is attaining tremendous popularity, and Boston is the true Hub of the wheel. They have a paper, those Boston bicyclists, all to themselves—the *Bicycling World*. Mr. Charles E. Pratt is its able editor. The sport already owes much to Mr. Pratt's energetic literary work. He is an enthusiast, and seems to have communicated his spirit to a large constituency of readers and riders. May the *Bicycling World* move noiselessly on.

LEGISLATION NEEDED IN ARKANSAS.—"Sam Monroe's" note that game and fish are disappearing about his home in Arkansas, is an emphatic commentary upon the rapidly changing game conditions of the country. Ever since the publication of Col. T. B. Thorpe's inimitable sketches of wild life and adventure in the Arkansas backwoods, the State has been regarded as a vast game preserve, and that even a portion of this hunter's domain should have been changed into a region devoid of game and fish is a fact worthy of reflection. The organization of Arkansas game protection societies is now in order.

PREVENTION OF CRUELTY TO ANIMALS.—At the fourteenth anniversary of the Society for the Prevention of Cruelty to Animals, last Thursday, it was reported that the aggregate number of cases which the Society had taken into Court and won since its establishment was 9,809; 18,857 disabled animals had been discovered working, and ordered out of the harness; and in 37,600 cases timely interference prevented cruelty. The Society has branches in thirty-five States of the Union.

THE YACHT RACING ASSOCIATION.

WE are in receipt of many communications concerning the proposed Yacht Racing Association, which has unfortunately met with a temporary obstacle. These we cannot print, as no good ends would thereby be furthered. All of them are more or less of the same import, and consist of a vigorous shutting of the stable door after the horse has departed.

For six weeks a person of notoriously bad reputation was to outward appearance in high feather with the members of the preliminary committee, although his real character was suspected by more than one connected with the movement. The meetings were held in a private office in which the general public could not have asserted its rights to participation in debate, should it have felt inclined to do so. When an individual has not paid his dues to a club for years, he is not generally considered a member in good standing; and when he assumes powers never delegated to him, his conduct becomes all the more reprehensible, even did his past record admit of scrutiny, which in this case it does not. The Committee erred, wittingly, or unwittingly, it matters not, in failing to examine into the title and personality of its composition. In this they were guilty of an oversight, and it is too late now to attempt to throw the blame thereof upon the public, or to lay at our doors the imputation of "throwing cold water." Drawing a line between rascals and honest men is certainly not demanding a very exacting standard of morality. In driving from the circle of yachtsmen any common swindler or jail-bird, we deserve the thanks of the community, and it is gratifying to know that *per contra* our course has received the indorsement of self-respecting men. We have been particular upon every occasion to exempt the many worthy gentlemen who went into the movement honestly from the force of our strictures, and from them we expect in time to receive full acknowledgement of the disagreeable service performed in their behalf. The public, however, is not to be called to account for considering the whole committee more or less tarred with the same stick, and noting the name of a swindler prominently connected with the inaugural steps, it very naturally abstained from coöperation. There is nothing "fastidious" in an effort to prevent the preponderance of an undesirable element among yacht clubs, as one correspondent alleges. It was a want of this "fastidiousness" which sent the Brooklyn Yacht Club down stream and built up the Atlantic Yacht Club, in which members find protection from the encroachments of confidence men.

If the intention to drive a sharper out from among us is "class legislation," as another correspondent asserts, it is exactly the kind of class legislation which we propose to enforce through these columns, and we have yet to learn that the impotent squealing of tadpole sheets will be sufficient to counteract the effects of this determination. The junior yacht clubs know full well that they have no stronger friend or advocate than FOREST AND STREAM, and we question very much whether they will view with favor, any more than the larger clubs, the attempts of any rascal to foist his obnoxious presence upon them by trick or device.

It stands to reason that the quicker the odium of evil association is got rid of, the better; and in enlightening the Committee upon the true state of affairs, we are enabling them to steer clear of the breakers which we discerned ahead, though unperceived by those more directly concerned.

Since the publication of our remarks last week, we have been called upon by a representative of the Committee, and have been assured that prompt measures will be taken at the right moment to absolve the movement from the charges brought against it; that no person will be admitted, unless provided with credentials from the club he claims to represent; that no one will be permitted to turn the movement into an advertising dodge; and that it is proposed to make all future steps acceptable to the public, including the banishing from their midst of any individual open to the charges made in these columns.

It is to be regretted that this assurance was not given to the public at an earlier day, in which event much of the harm already done could have been avoided. As our only cause of opposition to the success of the present effort arose from the presence of a bad character on the Committee, and as we now feel certain that he will be promptly sent into the Coventry so richly deserved, we withdraw from further opposition, and are willing to give aid in furthering the ends in view. Such clubs as may have been deterred from joining will now understand what led to our former remarks. Their intended effect having been accomplished, let the Yacht Racing Association receive all the support which will naturally flow its way, as there is no longer any reason why all clubs should not join and make a success of what is to their individual interest quite as much as it is to the public at large.

ENGRAVING A FUNGUS.—The common fungus found in the woods is susceptible of being wrought into many forms of artistic ornament. It is a common thing to make them into brackets, mounting them upon a suitable board and putting on a coat of varnish. Something I have never seen before is a method of engraving a picture upon the light face of the fungus, *i. e.*, that side of it which is underneath as it grows upon the tree. This is done by scratching through the light coating of the surface and exposing the dark color below. The brown beneath this forms the dark lines, the principle being that of the cameo. Dr. L. C. Nye, of Negaunee, Mich., sends us as a souvenir of the woods, a fungus thus prepared, the scene being a lordly buck with branching antlers, startled from his feeding and snuffing the air. This has been greatly admired by every one who has seen it in the office, and should fungi, thus worked into artistic ornaments, be placed on sale in the sportsmen's stores, we are satisfied they would meet with a ready sale. This process of fungus engraving may be familiar to many; to ourselves and to our friends it is as novel as it is happy.

THE WEATHER AND THE GAME.—The extreme mildness of the weather during the past month will cause the winter of 1879-80 to be long remembered as an extraordinary season. In this part of the country we have had, properly speaking, no winter as yet. The oldest inhabitants are sadly put to it to match these weeks with the recollections of something more unusual in the past, and many of the weather-wise veterans of our acquaintances confess all their former experiences outdone.

The effect upon game is two-fold. The wild fowl have not migrated South in their usual numbers. Our Southern correspondents complain that they are missing all their anticipated sport. Large rafts of ducks and geese are reported about the Illinois River and on other well-known grounds in the Northern, Middle and Western States. A New Jersey correspondent reported, a week or two ago, a flock of geese flying over to the North; and we need not remind our readers that this is a more reliable weather sign than are the prognostications of the Weather Bureau.

While the Southern sportsman is disappointed this winter, those at the North have reason to congratulate themselves that the warm weather will ensure a preservation of the quail, and a good stock for next season's crop. Two years ago the extraordinary fall of snow led us to call for more than usual care in the protection of the suffering birds. This year the case is, so far, exactly the reverse.

The winter abroad is on the contrary most severe. On the Continent and in the British Islands the thermometer fell on the 10th instant down to eighteen degrees below zero, Fahrenheit, and in Switzerland and South Germany the newspapers are publishing accounts of human beings and animals frozen to death. In France it is so cold as to preclude shooting, and the game is dying of cold and starvation, the ground being so deeply covered with snow or frozen so hard that they cannot feed. Wild bears in the forests, and hares, partridges and pheasants, frozen stiff, have been picked up in large numbers. Hunting is at a standstill both in England and in France.

THE NATIONAL RIFLE ASSOCIATION.

THE annual meeting of the N.R.A. washeld on Tuesevening, and the report, which is to be found in another column, was presented to the life members. The past year has been a quiet, but none the less a busy one. There have been no surging crowds at Creedmoor, packing the space behind the firing points to see some exciting contest of International teams. The "Palma" has rested in its dusty place of security, and remains a standing challenge to the riflemen of other countries. They may look at it with longing eyes, but the only way to its possession is over the hard fought battle before the butts. It must be confessed that there is very little chance of a British team taking the Palma for some time to come, and if a British team cannot do it, it is pretty certain that no team of any other nation can bother us. It may be thought that our men are sleeping, and may be caught napping by some foreign team coming on us unawares. There is no cause for alarm in this, however, and with the legal notice given by any challenger for the International Small Bore Trophy, they will find an American team ready to meet them, with weapons, system and men as good as any of the preceding American teams have shown. Some attempt at reviving the old time interest in long range practice is making by the movement to send a picked team of Americans to England this coming summer. But while their shooting will be looked for with interest, they carry with them no official character, and their defeat or victory will not materially take from or add to the standing of American riflemen.

But small bore work aside, Creedmoor has had a busy season of military practice, and the FOREST AND STREAM in its last issue pointed out wherein this practice was important. Were nothing else done at Creedmoor, the military shooting alone would justify the support given the range, and it is a question whether it would be a loss to make Creedmoor an exclusively military practice ground. The All-comers matches at Creedmoor during the past year have been many and varied, and a general interest

one who taken in them, especially at the short ranges and the inches open to military shooters. Long range work has vanished, but on the whole the year shows, so far as the shooting records are concerned, a satisfactory return. Creedmoor is not now the only place in the country where good shooting is to be looked for. Due attention is paid to it as the mother range, but here and there, on a dozen ranges, records have been made which leave to Creedmoor a rusty sort of glory, and an importance as the site where historic matches have been fought.

In the selection of Col. Henry A. Gildersleeve as President of the Association, a good man has been chosen for the head of the riflemen of the country. Col. Gildersleeve has done good work in the past as a practical shot, and his work in the field has been sufficiently well rewarded to warrant a return of effort on his part. He needs only to push the affairs of the Association to make his administration a success. He certainly should have influence enough to bring the Palma out from its retirement, and set it once more before the public as a live object of competition. At all events, shooters, with what they consider cause for complaint on any subject connected with range practice, may lay their grievances before the new President of the Association with an assurance that they will be heard by one who has known what it is himself to lie down for long-range or brace himself for a short-range shot.

With F. J. Donaldson as Secretary there should be no more complaint that the Association is a purely military body, and that civilians had no rights to be heard in the councils. With such a position Mr. Donaldson has power to shape the destinies of the Association very materially. He will make out the monthly programmes of matches, and if the off-hand shooters do not get a good showing now they will have only themselves to blame. Mr. Donaldson may do much in systematizing the business affairs of the Association, and with the abundant time at his disposal may introduce new features, and rouse Creedmoor from its long lethargy.

EATING TWO QUAIL AND A PIGEON EACH DAY FOR A MONTH.—A correspondent has sent us a clipping from the San Francisco *Bulletin*, which refers to a physician in that city who has undertaken to subsist for a month on this diet of fowl. As our correspondent is interested in the subject, he asks that we give the subject notice in the hope that he may learn the result of the attempt. This has been tried successfully so many times that it has lost all interest for most people.

FOREST AND STREAM GAME AND FISH DIRECTORY.—We have already received several appreciative letters in response to our prospectus of a directory of game and fish resorts. Our large cities are full of business men who have but a limited opportunity for sport in the field. Time is precious to them. They cannot afford to spend a week in hunting up a place to go to. It is for the benefit of such that we have established our bureau of information.

Hotel-keepers whose houses are in good game regions are advised that it is to their interest to send us full particulars of their attractions for sportsmen tourists. In no way can they reach a larger class of customers than through these columns.

NEW WATERS FOR FLY-FISHING.—Fly-fishing is the refinement of the angler's art. To cast the Silver Doctor is the antithesis of bobbing for eels. Fishing with the fly is sport pursued alone for pleasure, the fitting recreation of a man at peace with his stomach, not the hunger-impelled drawing out from the waters of something to fry and devour. Anglers, who have felt the thrill which follows the strike when the unwary prey has risen to the lure, have advanced to a plane in the ethics of the craft higher than that attained by the line and lead fisherman. It is natural then that the rod, reel and fly should appear as innovations and their bearer as a pioneer. Seeking new waters for his favorite sport, the fly fisherman becomes the tourist. He carries his methods into regions where they are at first hailed with contempt, then tolerated, and at last adopted.

The great army of fly fishers annually migrate Northward. We unconsciously connect the paraphernalia with the dashing mountain streams on the northern lakes and the salmon rivers of Canada. The attractions offered at the extreme South have not held a high place in general esteem. Possibly this is because those attractions have never been adequately set forth. The approved indigenous method of fishing in Florida, for instance, is with stout line, lead sinker, and hook baited with fiddler, clam, or cut up fish. The fly is used there almost exclusively by transient visitors; the field yet open to those who delight in this sport, is not, we are sure, suitably appreciated.

Dr. Ferber, who is now on the Southwest Coast, will use the fly almost exclusively, and "Al Fresco" has promised us an account of the Doctor's success. The record will doubtless serve to show that the waters of that coast are the proper winter fishing resorts of the country. Indeed, "Al Fresco" goes so far as to claim that they furnish the best fly fishing in the United States.

RIFLE, FISH HOOK, AND SMELTING PAN.

SITKA, Alaska, *Nov. 10th*, 1879.

THE monthly connecting link between us who are exiled (I trust for our country's good) from the rest of the world—in other words, the mail steamer *California* came in, bringing us news from the Eastern States up to Oct. 15th. What said news may be, I haven't the ghost of an idea, except so far as gathered from items of the public, sandwiched in between the layers of private matter in my letters; for, when the mail comes once a month and leaves the day after, one don't have much time for aught else than reading and answering letters. One from your editor gives me a hint that there is an Indian war going on in Colorado, accompanied, however, by his prognostication, based upon familiarity with the situation and good opinion of the Utes (what are Utes?) that it won't last long.

I read with pride of the good work of Laird, Lauritze, Dr. Scott, and Adie, and referring to my score books I found that in quite a number of off-hand rifle matches, I have beaten them as often as they have me, except the Doctor, whose record I find always a little ahead.

I am keeping up my rifle practice on ducks, divers, and other sea birds, and find that on account of the excessive wildness of all which have as yet reported, I can do quite as well as with my Parker. Early in October the ducks began to come, and in a few days they were all around us in countless numbers; and a visit to their feeding grounds at daylight was rewarded with no end of shooting, but when we found at the table that our game was of inferior and fishy flavor, our ardor cooled and we worked harder for less numbers of mallard and teal, a few of which had come. Then came a few days of cold weather, thermometer down to 25 degrees, and every duck started for warmer climes. And now, although the snow is gone (except from the mountain tops, where it is perpetual) and the ice has melted, and a bull movement in mercury has occurred, few successors have arrived. And a long tramp is frequently unrewarded. The Indians bring in plenty of venison and ducks, but they are more enterprising than we are: go further from home, ambush among the lakes up among the mountains, and wait patiently by a deer trail, confident that "Spose he no come to-day, he come to-morrow," and a couple of mallard, at two bits each, rewards them well for a day's work, while a good buck, worth from three to five dollars, proves a fortune and sets them up in hoochenoo and smoked salmon for a month.

We depend upon the Indians, too, for our fish; the salmon season is over. Now and then a purple, humpbacked monster is gaffed out of the head waters of the streams, and welcomed by the capturing Lo; but we don't take stock in them. The trout fishing is ended. I tried Indian River thoroughly, on a bright day a week ago without success, but the Indians bring us splendid halibut and what is called "cod" here, but which is not cod unless said fish has adopted a habit of shaving off its goatee, for there are no—what is the word?—barbels. I mean the tentacle-like appendages to lower jaw. But Alaska waters do furnish plenty of good and genuine codfish.

I have interviewed James Haley, skipper of the schooner *Nellie Martin*, to which belongs the honor of being the only arrival in Sitka Harbor, since our arrival in June, except the monthly steamer. She brought up a load of lumber, 11,000 feet, which was quickly absorbed by the superintendent of the Stewart Mine, at $27 per M.

Haley is a Connecticut man, from Saybrook, and knows all about Yankee cod and menhaden, so is competent to speak, which he does, as follows:—

In the summers of 1877 and 1878 he took the schooner to the entrance of the great bay which makes into Admiralty Island, which island is about the middle of Chatham Straits, on the eastern side. There is now an Indian ranche called Kon-tzi-noo—which, by the way, is supposed to be the original starting point of the fiery liquor named after it. Taking advantage of slack water, for the ebb and flow into the bay produces a fearful rapid, he has moored his schooner well inside, and while lying there, in one run twelve, in the other fourteen days, he has filled her, on each occasion, with eighteen tons of excellent codfish ranging from five or six to thirty or thirty-five pounds weight; that he was not, nor any of his men, permitted to fish, this business being monopolized by the Indians who sold him the fish at $25 per thousand, big and little, just as they run, and that as he paid in trade, their cost was much lower; that the Indians fish with barbless hooks, using herring for bait, and that the herring are beyond computation in their abundance. The season for the cod begins in March, and for the herring at the same time. He says that the Indians say that in July and August they catch the cod in the greatest numbers on the surface, gaffing them into the boat. He describes the herring as being the most oily fish that he knows of—more so than the menhaden—to use his own words: "A dozen of them fried in a frying-pan will furnish fat enough for their cooking, and a yeast-powder box full besides." A barrel of this oil, which he bought for twenty-five cents trade, he sold in Portland for forty-five cents each per gallon, and it proved very valuable for tanners' use. He says, further, that all through Chatham Straits there are banks on which cod are plentiful, and near Auk and several other places where streams abound, salmon are plentiful, all of which looks as though it might pay somebody to establish a fishery up here.

Lots of other businesses are starting. The arrivals by last month's steamer comprised a few miners, accompanied by their satellites, faro-bank men and saloon keepers, but this month's has done more; again a few miners, but with them saloon keepers, gamblers, a skating rink man and a dance house proprietor. Everything indicates that in spring there will be a rush here. Already the town is assuming the characteristic features of a mining camp. Fortunately for law and order we have a good solid basis of actual miners, respectable, orderly, hard-working, adventurous men, who will, I guess, keep down the rough element, with our help. I trust that when the spring comes the mountains will draw away a large percentage of these people prospecting; but unfortunately it will draw away the real miners too, and deprive us of the treats we now enjoy listening to the yarns and tales of adventure, hardships, dangers, starvation and suffering, of which all have good stock, and which is issued freely to the circle around Whitford's big store. I thought a sea-faring life an adventurous one, but it is tame compared with "prospecting."

Wishing them all good success next spring, and that they may all "strike it well," I remain, PISECO.

GAME PROTECTION.

BUTCHERING THE DEER.—Chopping down a huddled herd of deer is exactly the same thing as slaughtering beeves in a slaughter-house; rather, it is worse. Beef is an important article of food, and in killing the ox the butcher is simply doing what society recognizes as a proper because necessary act. But no plea of necessity excuses the brutal deed of a man who makes a slaughter-house of God's forest. The wholesale, cool-blooded, deliberate and cruel murder perpetrated by the old and young "hunters" whose exploits are detailed below, is an offence mitigated by not one single consideration of necessity or sport. If this is the kind of "fun" the participants wanted, we confess ourselves at a loss to imagine what conception they may have of "fun." We know many professional hunters who will indignantly disclaim that these Kentucky deer butchers belong to the craft. It may be added that this slaughter must have been accomplished simply for the "fun" alone, for the laws of Missouri forbid a non-resident killing deer to take out of the State. Here is the story:—

Mr. Clay Rice passed through Paducah a few days ago on his return to his home in Lyon County from a hunt in the swamps of Missouri back of New Madrid. He informed us that himself and son, about seventeen years old, and one other person from his neighborhood, had been there hunting for two weeks or more, having very fine success, and that on the two days after Christmas they and five others killed ninety-three deer. There was a sheet of water pretty much all over the country, with frequent small islands or ridges sticking up just above the overflow, and the deer would get on these in great numbers, and on the two days spoken of there was a thick sheet of ice over the water, which prevented the deer from escaping from one ridge to another, the party driving and slamming them in on the narrow points, until they had all the fun they wanted killing them. One man stood in his tracks and killed eight before moving. Two of the party got about fifty huddled up, and killed fifteen before the others got away. Six were killed on the ice by cutting their throats, that never were shot. Mr. Rice is an old hunter, and says he has never seen such slaughter among deer before. His son, who had never shot at a deer before, killed six in one day. This kind of slaughter, however, only held good while the ice lasted, as at other times the deer would wade or swim from ridge to ridge, and could not be hemmed. Those who had rubber boots waded about and got quite a number, however, even when there was no ice.

MIGRATORY QUAIL IN GEORGIA.—We are publishing from week to week data which when collated will make a very fair history of the introduction of the migratory quail into this country. Our correspondent at Lawtonville, Ga., writes under date of January 5th of their appearance there. We hope that the little fellows will elsewhere enjoy the same immunity awarded to them by St. Clair:—

On the evening of Dec. 19th, on returning from a shooting excursion, my dog pointed as I supposed a covey of quail. Intending to flush them but not shoot them until next morning, for it was nearly dark, I walked up my birds. What was my astonishment to see six dark birds rise, with not half the noise of our own quail, nor indeed near their size. Marking them down accurately, by daylight I was on the ground. In a few minutes I had a point, from which, after "roading" for fully fifty yards, there rose a quail. But not our quail. I could have shot it easily, but I think I had no right to shoot a bird introduced by Northern gentlemen at so much expense. I could find no more of them, owing to the fact that there was a large cypress swamp near by, into which the bird ran, for my dog trailed them into that place, into which it was impossible to follow them, owing to thick briars and covert. I never before saw a true quail (migratory) in the flesh, but from all that I have read, I know that

this was one. They are smaller than our quail, and darker, but they have about the same length of wing, and they fly precisely alike, but not with as much noise. I have gone over the same ground three times since, but I cannot find them any more. Should I see them again I will promptly inform you. ST. CLAIR.

THE NEW JERSEY STATE ASSOCIATION.—The annual meeting of the New Jersey State Sportsmen's Association was held at the rooms of the Jersey City Heights Gun Club on Thursday, 7th inst., President Eaton in the chair. The club-room was well filled, and the best of feeling prevailed. Reports from the different committees, among which was that on the State Tournament, were received and approved. A vote of thanks was given to the President and the Committee for the very satisfactory manner in which the first tournament in the State had been conducted and brought to such a satisfactory ending financially and otherwise.

The amendment to the constitution introduced at the late meeting giving the management of future tournaments to certain clubs, such clubs to pay all expenses and receive all emoluments from the same, with exception of 10 per cent. to the treasury of State Association, was adopted, and the high compliment was then given unanimously to the Jersey City Heights Gun Club—the authority to conduct the tournament for 1880. That it will be a success, the tournament just past, put through for the most part by members of that club, will guarantee.

A committee on nominations of one delegate from each club present was then appointed on motion by the chair. President Eaton having positively declined, on account of his business, to again accept the position, the committee reported the following: President, Sheriff John J. Toffey, J. C. Heights Club; First Vice-President, Wm. Dunlap, Midway; Second Vice-President, Wm. Hayes, Essex; Recording Secretary, P. W. Levering, J. C. H.; Corresponding Secretary, J. Q. Bird, J. C. H.; Treasurer, W. J. Conover, Midway, who were unanimously elected amid general good feeling.

The Association instructed the Committee on Game Laws to do all in their power to have the laws altered to make the open season on woodcock from Oct. 1st to Dec. 15th, and quail, grouse and rabbit from Oct. 15th to Dec. 15th; also to have the fine for shooting out of season or trapping increased to $50 for each offense.

Speeches were made by the outgoing and incoming Presidents, Mr. Hays, Mr. Frances, Dr. Bird, Mr. House, and others, and a good time generally was had.

LUZERNE COUNTY CLUB.—The Luzerne County Sportsmen's Club, of Wilkesbarre, Pa., have sent out posters containing a full digest of the Game Laws of the State, together with the offer of the club to guarantee payment of a sum equal to the full amount of the recovery, to any party prosecuting to conviction any violator of the Game Laws of the State of Pennsylvania.

The club have also adopted an effective plan for the extermination of vermin destructive of game. They give two prizes of guns for the largest score of foxes, skunks, minks, weasels, hawks and owls, these counting respectively 3, 3, 3, 1½, 2 and 1. It will take at least a score of 200 to win the first prize, and a score of 125 to win the second prize. The scalps of foxes, skunks, minks and weasels, and the heads of hawks and owls will be received as evidence.

Any one competing can send the evidence to the hardware store of J. W. Patten & Co., Wilkesbarre, Pa., where the sender will receive credit for the score killed. The evidence must be accompanied with affidavit that the vermin was killed within the limits of the county of Luzerne. The party making the highest score before Sept. 1st, 1880, will receive the first prize, and the next highest score will win the second prize, subject to the above provision. All scores will be counted up on Sept. 1st, 1880, and the result published in two of the county papers.

The Rifle.

A NATIONAL GUARD ROLL BOOK.—Wilbur & Hastings, of 40 Fulton street, are the publishers of an admirably compact National Guard roll book. It was compiled by Sergt. W. A. French, and is complete in its way, containing company, squad and furlough rolls, also civil officers and committees. It is intended for use by non-commissioned officers, enabling them to keep—as the by-laws of the code require—"a full and complete roster of the members, together with their residences and places of business, also a list of their respective squads." The space for company drills is large enough for a whole winter's work of a well schooled organization. Then follow spaces for the roll calls and regimental drills and parades, and also for meetings of the company. The attendance at squad drills are kept in the next section of the book with the same facility for condensed entry and reference. The marksmen may be entered up in like fashion, giving space for the score and also for noting the number of bars each man is entitled to. The entry of any detail of men made from the company may be entered next, and special blanks enable a succinct memoranda of furloughs granted to be kept, noting time of granting and expiration, and what disposition was finally made of it. The squad rolls and the company roll in full are followed by spaces for civil officers and any special committees which may be appointed; the whole ending with spaces for the entry of the regimental, brigade and division officers. The book is small enough to slip into any pocket, or may be carried in the belt, while it is strong enough to bear all the handling it is likely to get in field and armory. To a systematic sergeant this snug little note-book will be regarded as the champion labor-saver.

—Separate Troop D, of the Fifth Brigade, Brooklyn, had a large party in attendance at their thirty-second annual ball on Thursday evening last. Twenty men were presented with marksmen's badges, some of them veteran emblems, and special badges were given Privates Plush and Lakeman. After a review and the presentation dancing was in order far into the morning.

MASSACHUSETTS.—*Boston, Jan. 9th.*—The New Year rifle match which opened on the first of the month at the Mammoth Rifle Gallery has become very popular with one and all who are admirers of the rifle. The gallery was well filled during this last week with members of the several rifle clubs in this vicinity. The competition for leading places has been lively, and no doubt before the month is ended larger scores will be made. This new match is for eight cash prizes valued at $50; conditions, the three best scores during the month to win. The following is the standing of the several competitors; 150 feet; rounds, 8; possible, 40:—

U. A. Pollard	39	39	39—117	N. S. James	36	35	36—107
W. H. Harrison	38	39	39—117	W. W. Mann	36	35	35—106
N. Stone	38	39	39—116	E. C. Grover	37	34	34—105
E. F. Richardson	37	38	39—114	S. B. Brann	36	35	34—105
J. Merrill	37	38	38—113	Isaac P. Gragg	35	35	35—105
A. E. Robbins	38	37	37—112	H. Tyler	35	34	35—105
J. Ames	37	37	37—111	D. Hickey	36	33	34—103
D. L. Neal	36	35	37—108				

Last month Messrs. Richardson and Harrison were tie for the first and second prizes, both making a clean score of eight consecutive bull's-eyes. In shooting off they both tied again, Mr. Harrison outranking Mr. Richardson. G. E. R.

Boston, Jan. 10th.—There was a large attendance of members of the Massachussets Rifle Association, their friends and visitors from other clubs, at the meet to-day at Walnut Hill. The feature was the second competition in "Everybody's Match." A gentle breeze from 9 to 10 o'clock prevailed, with a good light. Some good shooting was done:—

W. H. Jackson	4	5	5	5	4	5	5	4	5	5—47
J. S. Sumner	5	4	5	5	5	5	5	4	5	5—48
A. B. Weber	4	5	4	5	5	5	5	5	4	5—47
E. W. Law	5	5	5	4	4	5	5	4	4	5—46
J. Nichols	4	4	4	5	4	5	5	5	5	4—45
E. Davis	4	5	4	4	5	4	5	5	5	3—44
H. Tyler	5	4	5	4	3	4	4	5	5	4—43
E. Whittier	4	4	4	5	4	4	5	4	5	5—44
E. R. Grilling	4	4	4	4	4	5	5	4	5	5—44
S. Lewis	5	5	5	5	3	5	3	4	4	5—44
S. Wilder	5	4	4	4	3	4	4	5	4	3—40

Capt. Jackson and H. Tyler used military rifles, and according to the regulations of the handicap, two points are added to each of their scores, making Jackson's 49 and Tyler's 45.

Boston, Jan. 14th.—The annual meeting of the Massachussetts Rifle Association for the choice of officers for the ensuing year, and transaction of any other business, was held at Post 113 headquarters, 608 Washington street, on Tuesday evening, Jan 13, at 7 o'clock.

Hopkinton.—The Rifle Club held a shoot at their range at Claflin's Grove on New Year's Day. Weather conditions favorable. Ten rounds at 200 yards, off-hand:—

E. R. Rose	4	4	4	4	3	4	4	4	5	4—40
G. P. Woods	4	5	5	4	3	4	3	3	4	4—39
C. H. Rose	3	4	4	4	4	4	5	4	4	3—39
J. M. Webb	5	4	5	3	3	4	4	4	4	4—39
W. B. Claflin	3	4	3	5	4	4	4	3	4	4—38
J. Wadsworth	4	4	3	3	4	3	3	4	5	5—38

Saturday, Jan. 10th, was the regular shoot. Weather conditions favorable; a good light and little wind. Two hundred yards, off-hand, twenty rounds:—

P. W. Smith	5	5	5	4	3	4	5	4	4	4	4	5	5	5	5	4	5	4	—	89
O. C. White	4	4	5	5	3	5	4	3	5	5	4	2	3	4	5	4	4	5	4	—82
C. H. Rose	4	5	4	4	4	3	3	5	3	4	4	4	5	4	5	3	4	5	—	81
G. P. Woods	4	4	5	4	4	4	4	5	4	4	3	5	5	3	4	4	2	4	2	—79
J. M. Webb	4	2	3	4	4	3	4	5	3	4	4	3	4	3	4	4	4	4	—	74
C. A. Frost	3	4	0	4	3	4	3	0	4	0	4	3	5	5	4	4	3	3	3	—62

RING SHOOTING.—A match took place at Hartung's Park, Morrisania, on New Year's Day; open to all comers; ring target; 25½ in. rings; off-hand; 200 yards; 50 shots per man; prize, a Ballard rifle. The scores were as follows:

P. Fenning	1,039	G. Joiner	984
H. Oehl	1,033	D. Miller	971
C. G. Zettler	1,024	B. Zeuler	950
N. D. Ward	990	M. B. Engle	919
J. H. Brown	989		

BROOKLYN.—The omnibus match which has been in progress at Fisher's long-range gallery in Fulton street closed on the 2d inst. The conditions made it open to all comers; five competitions; the one making the highest aggregate in three scores to have the first choice, etc.; ties to be shot off. The winners were as follows:—

F. H. Holton	48 48 50—146	W. O. Wetherbee	46 47 48—141
T. P. Wilcox	47 49 49—145	Chauncey Marshall	44 45 45—135
P. Ronaldson	46 46 49—141	M. B. Hull	40 42 43—125

A new match has been opened, to be shot on each Saturday. It is open to all comers; rifle, .22 calibre; position standing; five shots on ring target. Every target will be numbered, and each competitor will receive a numbered ticket corresponding with his target. The target when shot will be placed in a sealed box until the close of the match, when they will be counted, and the competitor holding the ticket corresponding with the highest target will be declared the winner. In case of a tie the one having the wildest shot to lose.

Jamestown, N. Y., Jan. 5th.—Leading scores made last week at R. H. Burns' Conservatory of Marksmanship for the champion medal; off-hand; 22-calibre rifle; 350 yards; target reduced to gallery distance; 10 shots:—

John Benson	47	E. J. Blakesley	47
Chancey Woodworth	47	Fred Warner	47
E. S. Blakesley	48	Dr. A. P. Ward	48
W. H. Hotchkiss	48	H. W. Watson	48
H. M. Winsor	50	M. Southwick	50

In shooting off tie Winsor won the medal, which rather necessitates his appearing on the streets with coat thrown wide open, irrespective of cold winds.

PINACENTER.

OHIO—*Akron, Jan. 4th*—On Dec, 27th Mr. Joseph Young, a member of the Akron Rifle Association, met with a very serious accident while loading shells for his breech-loading Ballard rifle by the charge going off while he was driving the bullet into the shell. The explosion broke the metal instrument that goes over the shell, and mangled his left hand so badly that it had to be amputated at the wrist. He is getting along nicely now, but the accident, besides depriving him of a sport that he was very fond of, has taken from the club an active and kind hearted member.

CALIFORNIA.—The closing match of the San F Long Range Rifle Club was held at the Bay View, Saturday, Dec. 27th. The match was shot at 1,000 for the champion diamond medal of 1879, the medal awarded to H. C. Smith, who was declared champion having made the highest percentage for the year.

The highest scores during the year were: H. C. Sm. 73 out of a possible 75; R. C. Hanson, 70; S. H. Harm 69; F. G. Liebert, 68; O. F. Graves, 67; H. J. Burns, F. G. Edwards, 66; H. J. Burns, 67. The club has ma considerable improvement, and a comparison with te Eastern and European long range clubs gives a favoral showing, as almost all the matches here are shot durir the prevalence of high winds, baffling the skill of suc Eastern marksmen as Lawrence Weber, Milton Farrow Colonel Stetson, Mr. Davidson and members of the Britis team.

The Club will shoot a series of matches for the championship of 1880, and also a diamond medal and a second-class medal. The terms of the matches will be the same as those of 1879.

The Winchester Repeating Arms Company has recently made a present of a handsome rifle to Mrs. Ruth, the California lady shot, whose reputation for shooting is scarcely less than her husband's. The rifle is an exceedingly neat weapon, with pistol grip and shot gun butt. It is very finely finished, and with it the lady intends to astonish the world. On Christmas Day John Ruth, her husband, used the weapon at a turkey shoot, killing four successive gobblers at 200 yards.

BALLS FOR A MAYNARD.—*Chalk Creek, Col., Dec. 12th, 1879.*—"Subscriber," who wrote an article upon "Maynard Rifle Shells" in your issue of Nov. 13th, speaks of killing much larger game with a Maynard .50 calibre, for which he had both solid and expansion balls. If you think it would interest others as well as myself, will you ask him which ball proved the most effective? I think of ordering a .50 calibre barrel for my Maynard.

WM. GOLDTHWAIT.

THE SHELL TROUBLE ONCE MORE.

Had I known that the water was so deep I would have kept closer to shore. In FOREST AND STREAM of Nov. 13th I notice the comments of "Rabb" taking me to task about some little off-hand suggestions of mine in a former number regarding rifle shells, loading, etc. I began this "shell rage" in endeavoring to help "Bexar" out of his trouble, but not to make a tirade on all riflemen and shellmakers, yet I find great commotion among them all; however, in all the communications on this subject from other gentlemen, none have found need of that severe rasping as our friend "Rabb."

These other gentlemen, however, may differ with me or with each other on some special points, yet upon the whole they all in a measure agree with me. As to loose bullets shooting more correctly and constantly then bullets that fit snugly, and when dry naked bullets make better targets than lubricated ones, I step down and out. Factory bullets, after being seated in the shell, are dipped into a compound of tallow and wax while warm, which causes a great deal too much to adhere to the bullet, and when I use factory cartridges I take a rag and rub off all that lubricant except just enough to keep the bullet from leading the rifles, but do not use the bullets entirely dry. If my bullets become dry from wearing in the pocket I rub on a little oil before placing in the gun. Dry bullets will do excellent for a few shots, but you shoot fifty or more times with dry bullets and don't wipe out your rifle, you will then see what will become of your target. I don't mean to be "dictatorial" in this, as "Rabb" insists, and I think we have all got much yet to learn about rifles, for they get off some most unaccountable freaks sometimes.

I insist upon having this to say, that if gun and shellmakers don't want their work criticised, let them become clever enough to obviate these difficulties. The sportsman is the consumer, and pays the gunmakers' "swinging" prices for their goods, and if the sportsman finds some great and perhaps dangerous mistake in the arrangements and working of his gun that he has just paid a big sum for, and if he says anything unfavorable about it, the jealous manufacturer "kicks," and considers the hunting man hard to please. These troubles were unknown in old muzzle-loading times.

When a manufacturer ships a gun he should equip it with all necessary tools for loading and include them in the price of the gun, and not expect a man living two thousand miles away to know all the extras that are even essential to a gun that probably he has never seen one of. But they don't do that. They will put in a part of the tools and leave the rest out. I have had three fine double guns made in the past three years, and it took me a month or more to each gun to get together all the necessary tools for loading and shooting.

One word about shells. I think the thin brass shell is the shell of the future. Thick shells will never do unless they fit the chamber so snugly that there is no room for expansion. I have shot FFG powder out of Remington's and Union Metallic Company's thin brass shot-gun shells, using five and six drachms powder and one and a half ounce soft shot, out of ten-gauge Parker gun; also, four drachms same powder or four drachms Hazzard's Electric Nos. 2 and 3, in twelve-gauge Nichol's gun, using same make of shells, and shot them hundreds of times, never having one to snap or expand; nor do I believe any amount of powder could injure one of those shells, no matter whether fine or course, without injuring the gun itself. So it is no use of "Rabb" believing or asserting that there is no shell made that will shoot fifty or more grains Orange Lightning No. 4 or Hazzard's Electric No. 3 without troublesome expansion. This expansion of shells is owing entirely to the elasticity of the shell and the closeness of the shell to the shell chamber. If the shell be thick, it cannot be elastic and made of brass or any other soft metal, and if it fits the chamber, and there being no room for expansion, it cannot expand. In conclusion, if Mr. "Rabb" still thinks that I know nothing about rifle shooting, tell him to come down here and hunt deer and turkeys with me one season, and after that we will compare notes. C. L. J.

Willis, Texas, Dec. 23d, 1879.

A Massachusetts correspondent writes: I have read with great interest the communications from time to time in regard to the expansion of shells, and have hoped that some

one would be able to suggest a remedy for it. I have had the same experience as my brother-sportsmen say they have. I bought about a year ago two Ballard rifles, one of them a Creedmoor and the other a Schuetzen, using 50 grains of powder and 270 grains lead. The shells at first worked admirably, but, after using three or four times, commenced to stick, and some of them could not be driven into the chamber of the gun more than half an inch. After the first time the shells were fired the bullets would drop out of them if they were inverted. I have not a bit of fault to find with the rifles I own, for I know there are no better made; and it seems strange to me that the makers will not try and overcome this really only disadvantage the Ballard rifle has. For accuracy they cannot be beaten. I hope the sportsmen who own and use these rifles will keep up this "Everlasting shell" agitation, and perhaps influence the makers to overcome this obstacle, and give their shells as honest and reliable a name as the Ballard rifle holds. ANOTHER STICKER.

ANNUAL REPORT OF THE N. R. A.

NEW YORK, JAN. 13TH., 1880.

To the National Rifle Association of America—Mr. President and Gentlemen:—

Since the submittal of the last annual Secretary's report in January, 1879, many events of interest to members of this Association, as well as to riflemen generally, have transpired, though they will be but briefly referred to, as it is believed that any extended notice here would be a needless tautology, the various reports of officers and committees, which will appear in the annual report of 1879, being very complete.

The Secretary cannot, however, let this opportunity pass without noting the gratifying financial condition of the Association, the credit for which is largely, if not wholly, due to the careful and efficient management of the Treasurer, Hon. David W. Judd. The balance shown on his report, though smaller than the amount that appeared at the opening of the year 1879, being a clear and true balance without liabilities, shows a more healthy financial condition than has existed in the Association since its organization.

As you are aware, the seventh annual meeting of the Association took place January 14th, 1879, and the action taken thereat was printed in full in the annual report published that year.

The subject of changing that portion of the by-laws relating to annual membership assumed the proportion of a proposed amendment subscribed to by ten members, as required, and to the effect that Section 3 of Article X be amended so as to read:—

"3. Clubs of fifteen from any Company of the National Guard may become members of this Association on payment of two dollars a year per man. Clubs of twenty or over from any Company may become members by paying one dollar and a half each a year."

The passage of this amendment being recommended by the Board of Directors, a special meeting of the Association was called for Tuesday, March 18th, at the rooms of the Association at 4 o'clock P. M. No quorum being present, at 4.30 the meeting was compelled to adjourn without having transacted any business. Following close upon this came another proposed amendment, regularly subscribed to by ten members, and which passed the Board of Directors, with recommendations for its adoption. On the evening of Monday, March 31st, in answer to a call for a special meeting of the Association, its members assembled at the New York State Arsenal, and at a little after 8 o'clock P. M., the President being absent, Gen. Wingate, the Vice-President, took the chair and announced that the object of the meeting was to act upon (either to adopt or reject), first, the proposed amendment of the by-laws, changing the amount of annual dues in Sec. 1 of Art. X—and in Sec. 2 of Art. XI—from three to two dollars; and secondly, as to striking out the whole of Sec. 3 of Art. X.

A motion by Major Fulton to adopt the first part, changing the annual dues from three to two dollars, was made, seconded, put to vote and duly carried.

Following a motion to adopt the second part of the proposed amendment came a question from a member asking if a quorum was present. The Secretary being orderedby the chair to count, discovered that but twenty-four members were then in the room, being six short of a quorum. The legality of action taken being questioned and a ruling called for, the chair decided that the action taken up to time of discovery of a quorum not being present was legal, but that such discovery being now made no further business could be transacted or motions made, except to adjourn, which was thereupon done.

During the past year twelve regular and four special meetings of the Board of Directors have been held, the last one in December, 1879, being the ninety-third regular meeting held by the board since its organization. The average attendance at these meetings has been good, but one adjournment being necessary for want of a quorum. The Executive Committee has met eleven times upon call by the President or any member thereof. The only changes in the Board of Directors has been the vacating of the *ex-officio* Directorships caused by the resignations of the Adjutant-General of the State and the Inspector of Rifle Practice.

Committees for the year were appointed by the President in February, 1879, as follows:—

Finance Committee:—Lt.-Col. E. Harrison Sanford, Capt. William C. Casey, Col. J. H. Cowperthwaite.

Range Committee:—Gen. Geo. W. Wingate, Capt. Joseph G. Story, Col. Geo. Scott.

Prize Committee:—Col. John Ward, Major Joseph Holland, Major Jas. H. Jones.

In June last, Maj. D. B. Williamson was granted leave of absence until his return from Europe. Your Secretary likewise received leave of absence after the Fall Meeting till the end of the year, though such leave was not taken advantage of. The Assistant Secretary was granted forty days' leave of absence to go to Europe upon business. He reported for duty within the specified time. On May 6th, ex-Adjutant-General Franklin Townsend was elected an Honorary Director of this association for the term of three years.

It was early in the year decided to lay aside as a sinking fund that should be applied solely to repairs and improvements upon the Range at Creedmoor, all moneys received as dues from life memberships. This has amounted to $75. Eighteen new names have been added to our roll of life membership, thirteen of whom paid the usual fees, four were offered and won as prizes, and one was awarded as an honor.

Annual members (despite the reduced dues) have not been as numerous as had been hopefully anticipated, and though an increase of nearly fifty per cent., is shown upon the roll, the cash receipts from this source are rather below last year's figures.

The roll of affiliated rifle clubs and associations shows seven as against six in 1878, as follows:—The Empire Rifle Club, Amateur Rifle Club, Seventh Regiment Rifle Club, and Twelfth Regiment Rifle Club of New York, the Massachusetts Rifle Association, the New Jersey State Rifle Association and the Columbia Rifle Association of Washington, D. C.

Two military organizations, viz., Company I, Seventh Regiment, and Gatling Battery E, First Division, N. G. S. N. Y., each joined the association in a body under the by-law permitting such membership at half the usual rates.

Badges have been issued to ten life members numbers numbered from eighty-seven to ninety-six inclusive.

During the past season there have been ninety-seven matches of the N. R. A. shot at Creedmoor against one hundred and thirty-eight in 1878. This reduced number may be accounted for by noting the omission of subscription matches at the Spring and Fall Meetings. They are classed as follows:—Spring Meeting, 14: Fall Meeting, 19; Long Range Tournament, 1; Monthly Competitions, 63.

The total prizes awarded have been as follows:—

Spring Meetings—58 Prizes, value and cash			$1,190 69
Fall Meetings, 124 Prizes (exclusive of 20 Prizes, return of entrance fees	Value	$9,991 50	
	Cash	665 70	10,557 20
Long Range Tournament, 28 Prizes; and 28 divisions of entrance money	Value	$362 00	
	Cash	794 02	1,156 02
Monthly Matches, 264 Prizes	Value	$1,179 65	
	Cash	757 49	1,937 14
Total—402 Prizes			$14,841 06

Excepting the last month of the season, the general attendance at Creedmoor has been decidedly good, the entries in monthly matches comparing favorably with former years. In this connection the Secretary would respectfully call attention to the conditions of certain matches with prizes requiring to be won "the greatest number of times during the season," as a partial explanation of the decreased attendance and falling off of entries alluded to.

A competitor having won a prize four times say out of seven competitions during the season, is the only one then having any interest in the match, others knowing that they have no further chance of winning or even of tieing. Experience shows that the most interesting conditions for a prize (except in such as the "Champion Marksman's Badge" and "Diamond" matches, where objects other than to win the principal prize influence entries) are to require same to be won a certain number of times (not necessarily consecutive), before becoming personal property.

An error of my predecessor in office has been noticed in his report of 1878, in which it is claimed that 6,000 railroad excursion tickets between New York and Brooklyn and Creedmoor had been sold by this Association alone to members of the N. R. A. and N. G. S. N. Y., instead of which but 3,998 were disposed of. During the past year 7,024 have been sold at the rate of thirty cents each, the amount of $2,107.20 having been received therefor, and duly handed over to the Long Island Railroad Company.

Troops of the National Guard have used the range on three days of each week almost continuously from June 1st to November 1st, the approximate number of men shooting thereon during that period not being less than 13,000, which number, added to an estimated 5,000 in meetings and matches, would make the total number about 18,000, which might, perhaps, be safely increased to 20,000.

In the matches of the Fall Meeting a more general representation of military teams (especially from New York State) is to be noted. The presence of teams representing all the divisions of the army is also very gratifying, representing, as it does, the growing and unusual interest in this most important branch of the soldier's education. The Regular Army and National Guard being thus brought into closer competition, cannot fail to create a spirit of friendly rivalry that will develop an increasng skill and consequent efficiency in both branches of the service.

Though the absence of any foreign team at Creedmoor was a drawback to the popular enthusiasm, yet the matches were well attended, and shot with keen competition. The spring meeting, owing to unfavorable weather, was not well attended, and the Secretary is of the opinion that this part of the annual arrangements might be profitably omitted, and in its stead one or two special matches substituted, with popular conditions and prizes.

Major Jones elected Secretary February 4th, 1879; resignation to take effect January 6th, 1880. Major-General Townsend elected Honorary Director for usual term of three years from May 6th. Four life members during past year, viz.: Hon. Alfred W. Craven, Mr. John Klein, Col. J. M. Homiston, M. D., and Hon. H. K. Hackett.

NEW PUBLICATIONS.

CHESS OPENINGS. By H. W. Bird. Howard Lockwood. 74 Dunne street, New York.

The game of chess will always be pre-eminent as an amusement which compels thought and enforces mental discipline, and in this respect some of its best exemplars have been found in the United States. The author of this work has given us something worthy of the game, which challenges the attention of every chess player, and which is full of suggestion to those who hope to excel at chess. Mr. Bird's name is a guaranty of authority, since, he is recognized as an expert and as one of the greatest of English chess players. His book contains a series of forty-five openings, with illustrative games, and diagrams of noteworthy games and problems. These embrace the pith of the lessons taught by the great masters in chess strategy, and present in the plainest and most lucid manner the best openings for chess students to learn. The work is prefaced with a succinct and interesting history of Chess in America.

Game Bag and Gun.

GAME IN SEASON IN JANUARY.

Hares, brown and gray. Wild duck, geese, brant, etc.

FOR FLORIDA.

Deer, Wild Turkey, Woodcock, Quail, Snipe, Ducks, and Wild Fowl.

"Bay birds" generally, including various species of plover, sand piper, snipe, curlew, oyster-catcher, surf birds, phalaropes, avocets, etc., coming under the group *Limicolæ* or Shore Birds.

GAME AND FISH DIRECTORY.

In sending reports for the FOREST AND STREAM Directory to Game and Fish Resorts, our correspondents are requested to give the following particulars, with such other information as they may deem of value; State, Town, County; means of access; Hotel and other accommodations; Game and its Season: Fish and its Season; Boats, Guides, etc.: Name of person to address;—after the following model:—NEW YORK, *Bay Shore*, Suffolk County, Long Island. Reached by Long Island Railroad, forty miles from Hunter's Point. Hotel—Prospect House, John S. Rogers, proprietor, $12 per week. *Game*—Ducks of all varieties and geese, October 1st to May 1st; bay birds, after July 10th; quail, November 1st to January 1st. *Fish*—Bluefish, June 1st to November 1st; sea bass, kingfish, porgies, and sheepshead, all summer. Boats, $3 per day. Address, John S. Rogers, as above.

CHAMBERING BUCKSHOT.—It is the usual rule in chambering buckshot in choke-bores, to place a wad just within the muzzle of the barrel where the choke is the greatest, and on that to chamber the shot. Loads determined in this way will generally give satisfaction. We give below another method which seems to us an excellent one. It is well worth while trying this. We shall be glad to hear from those who may put it into practice.

R. T. writes from Van Buren, Arkansas:—

I have had some experience in the use of choke-bores with all sizes of shot, from No. 10 drop up to No. 1 buckshot. I have owned and shot several breech-loading shot guns, both cylinder and choke-bores. I have now a W. & C. Scott & Sons' No. 12 bore, full choke, and one that no reasonable money would purchase. I have tried all sizes of buckshot that will chamber in the muzzle of the gun. I find that she does not shoot any chamber proper of buckshot more than ordinarily well, not better than the cylinder-bores. But by experimenting with loading in different modes of chambering, I have made, as I believe, an important discovery in shooting buckshot with the choke bore. It is as follows: After the powder—say three and one-half drachms—is rammed tolerably well with two good pink-edge wads, place five buckshot in a ring on wads, and five more alternately around the first five, and five more alternately on those, making the load fifteen in all. Now there will be a space in the centre not large enough for a shot in each five shots, which space I leave open and place a good tight wad over them. When fired the space admits the closing of each ring of shot in passing the choke, and the pattern is more than doubled. I have had the thing thoroughly tried with over ten dozen choke-bored guns of my own and my sporting friends, and in every instance it is equally good. Of course the size of the shot must correspond to the size of gun with twelve bores. I find No. 8 buckshot, St. Louis mould, exactly suits in the U. M. C. paper shell. For a ten-bore No. 7 is the size. I am desirous of hearing from our brother sportsmen on the subject, and if my mode is not novel to them I am at a loss to know why some of them have not mentioned it in giving their experience with buck and choke.

What is meant in using the word "chamber proper," is that five shot is not an entire chamber, as no less than seven will chamber where one is in the centre. R. T.

DIVING DECOYS.—*Lexington, Ky., Dec. 19th.—Editor Forest and Stream:*—I have tried the decoying power of the diving decoy apparatus in a recent trip to Reel Foot Lake, and find the attachment a great improvement. It is easily handled and is very effective in drawing ducks within range. At Reel Foot we killed nearly every species of duck found in that region, and were perfectly satisfied with the diving decoys. B. W. D.

FOWL SHOOTING AT SHELTER ISLAND.—The mild weather of the last few weeks has delayed the migration of the fowl from Shelter Island, and they are now feeding around there in considerable numbers. A half-dozen batteries are now leveled against them, and from ten to forty fowl are killed daily by each boat. If rigorous winter should seal up these bays they will all disappear.

TENNESSEE.—*Savannah, Jan. 5th.*—Our quail season has just closed, and has not been a very good one. I was out several times last week, and shot fifty birds and seven hares. One of the latter was of the grey variety, and weighed five and a half pounds. Some parties driving for deer near Waterloo, a landing on Tennessee River, some fifty miles or more above here, killed, not long since, a buck weighing 199 pounds. He was struck by a single buckshot. A friend of mine, while shooting ducks in the Millwood bend of the Black Warrior River, shot and killed a ninety-pound doe. He had his gun loaded with No. 4's; disabled the deer with the first barrel, and after following her a short distance got in his left, which gave her the *coup de grace*. Duck shooting, owing to warm weather and high water, has been almost *nil*. We are hoping for colder weather this month, when you may expect better reports from us. WILL.

ARKANSAS—*Jacksonport, Jan. 3d.*—The present game season is the worst on record. Having no game law, the gun is not yet laid away. A party from Little Rock, Ark., with General B. Hempstead and several other gentlemen, whose names I have been unable to learn, have gone over to Swan Lake and West Prairie armed and equipped as the law directs. The mail-carrier reports that they have killed several deer and bear, but have heard nothing of their success with the birds. We are anxiously waiting for the spring flight of water fowl and for the snipe and plover. Weather miserably and tediously warm. YELL.

MINNESOTA DEER SHOOTING.—*Farley, Minn., Dec. 22d.* I have a No. 10 bore, full choke, 30-inch barrel, 9½ pounds, manufactured by William Moore, about seven or eight years ago, and I find that it shoots fine shot much better than it does coarse; that is, shot larger than No. 1 and BB. It shoots those as well as any gun I ever saw, and I have seen them all; but in shooting buck shot it does not shoot as good as I wish it did. I have tried most everything I have ever heard of, and this fall gave it up and purchased a Winchester, model 1876, which does all that I could ask of it or any other gun. I have killed four deer and an elk, the nearest shot being made at a fawn, sixty-five yards. The other three deer and the elk I shot on the run, none of them inside of ninety-five yards. One large buck and also the first one I ever pulled a trigger on, started at ninety yards. The first shot I missed him; the second shot I put a ball through him, just back of the heart; the next shot I broke his front leg, and at 250 yards I put a ball quartering of him which came out his front shoulder and he dropped in his tracks. The elk only took one ball through the hind quarters. You may think this is all long shooting, But you must know that it is not hills and valleys, but prairie just as level as a floor, with an occasional patch of willow brush and poplar, out of which we start them. WINCHESTER.

CALIFORNIA HUNTING PRESERVES.—The Coast Range Sportsmen's Club, of San Francisco, has selected one of the finest localities for hunting and fishing in the State, having taken up about 500 acres of good land about fifteen miles above Duncan's Mills, Sonoma county, the terminus of the North Pacific Coast Railroad. The land secured commands probably two or three thousand acres of grazing ground in the hills, and, regarded even as a business investment, the club cannot fail to score a success. But it is not at present looking at the matter in a business light, but as regards sport and recreation. The land is at the forks of a splendid trout stream, there is an abundance of small game, and the deer hunting is as good as anywhere in the State. The club will build a cabin, employ a keeper, improve the necessary roads, etc., within a few months. This is an addition to the regular preserves of the country, to which there will be many more added within the next quarter of a century.

A MONTANA DEER RANGE.—*Helena, Mon., Dec. 26th,* 1879.—The black-tail deer, after the first snow fall, leaving their summer haunts take a certain trail or pass to gain the lowland mountains skirting the unsettled valleys of our Territory. One of these passes near Helena has become the resort of our hunters. Two hours will bring us there, when at daybreak the deer can be seen on their journey and often in bands from ten to thirty. The various hunters stationed on this trail find good shooting, provided they can hit a deer on the jump, for after the first shot is fired the deer do not stop long to rest, but hasten along to gain shelter. Some of your readers will call us pot-hunters from the fact of killing so many, and possibly because the deer are offered for sale in our market. Yet we are not, nor do we make a living by the gun. We shoot for sport only. The following is a list of the persons who visited the range during the past fall, and the number of deer and elk killed within fourteen to twenty miles of Helena during the months of October, November and December, 1879:—

Deer—Redding Sims, 30; George W. Bashaw, 28; John Bowman, 27; W. H. Ewing, 18; Wm. B. Hundley and A. J. Kelley, 25; William Jones, 16; Oliver Allen, 5; J. W. Hopkins, 3; Thomas Charles, 5; D. W. Curtis, 3; Percy Hunser, 7; Thos. Kirkendall, 5; Mr. Take, 12; Mr. Manlove, 3; Travis Brothers, 4; Severn Jacobs, 11; M. E. Walton, 6; Jack Akers, 13; H. M. Barchen, 1; John T. Murphy, 4; D. A. G. Flowerree, 7; T. H. Kleinschrédt, 1; Chas. D. Bard, 4; Charles Oldham, 16; R. C. Wallace, 2; Charles Rumley, 8. Elk—David Merritt, 6; Dr. McIlhenney, 4; Wm. Roe (Grizzly bear, 1,100 pounds), 1.

Some reader may ask, Why kill so many? it will exterminate the deer soon. To those I can only say, that during the months of October and November it is estimated from fifty to one hundred and fifty deer pass along nightly; they don't travel much after 8 o'clock. I have seen eleven distinct paths made around a mountain in one night, which could not be made by less than from ten to fifty deer each. The number estimated by an old hunter to have passed that morning was six hundred. Is there any wonder so many deer are killed in such a short period? Montana offers a good field to the sportsmen. Our brooks abound with trout, our mountains with game of all kinds; our valleys afford good shooting for chickens and game; and in season ducks and geese are very plenty. In one of your articles—a "Tale of American Field Sports"—I observed that the rabbit comes in (*i. e.*, a few come to bag) after a hard day's work, and with the valuable assistance of a good dog. Those who are fond of rabbit hunting I beg to visit a small district out here, where they can shoot from fifty to seventy-five, weighing no less than six to eight pounds, in less than half a day. I killed eight in thirty minutes the other day, and am informed that last winter one man killed over ten dozen in one day's sport with rifle. The place is known as "Rabbit Ranch," and the owner tells me he has often counted upwards of three dozen from his doorway. I hope some of your readers will find their way out here to enjoy our climate and scenery, and the fine sport offered, and by personal observation learn something of the wealth of the great Northwest. HELENA.

OREGON—*Portland, Dec. 26th,* 1879.—Our unusual cold weather has ruined our shooting; the lakes are all frozen up, and the ducks, swans, geese, etc., have all gone South, with the exception of a few "broad bills," widgeon, and gray duck. No canvas-back shooting yet this winter to amount to anything. MULTNOMAH.

CURING SKINS OF GAME.—The following methods have stood the test of English sportsmen:—After pegging out the skin in the usual manner, rub well with wood ashes (not hot) from the camp fire; the ashes absorb the fat. At the first rubbing brush off the dirty and moist ashes and cover the skin liberally with clean, to remain on for some hours, then rub again, etc., as may be necessary. Skins treated in this way soon become dry and stiff, and may be carried on a light frame, or upon the bed when moving camp. Do not fold the skins until they are to be packed for forwarding. They should be frequently aired in the sun, the rubbed surface uppermost; air well before packing in air-tight tin-lined cases.

About twelve years ago I shot a very large pelican in South Australia. Being on a journey, I had no means of obtaining arsenical soap, but preserved the skin temporarily with a small quantity of salt and plenty of black pepper. As soon as I could obtain arsenical soap, which was about a fortnight later, I removed the salt and pepper as well as I could, and applied the arsenical soap, and the skin is still in perfect preservation. I should think a mixture of chloralum and turpentine in equal parts would prove the best preservative for large skins.

MY FIRST COUGAR.

I THINK I was the worst scared boy of seventeen that ever raised a rifle to his shoulder when I saw my first cougar—a tiger, they called the beast in Florida. It was in Florida, during the Seminole War, while I was attached to McLaughlin's Naval Squadron, consisting of the United States schooners *Flirt, Wave* and *Otsego*. One day I left the *Otsego* at her anchorage inside of Carysport Reef, and went on shore on Key Largo after deer, bear, or any other large game I could find. I carried a U. S. Yager rifle, .32 calibre, and a pair of rifle single-barrelled pistols in my belt.

I pushed on through the dense forest until I was a mile or more from the landing place, seeing nothing but myriads of lovely parcoquets and the brown doves which are so plenty on the Florida Keys. But, all of a sudden, I heard right behind me a kind of a purring sound, and turning, saw, not ten feet above the ground, scarce five yards away, on a limb under which I had just passed, a great tawny beast staring at me, with eyes that glowed like balls of fire in that dark, dense forest growth.

To wheel and raise my rifle to my shoulder was the work of a second, but I was shaking from head to foot. I could not get my sights to bear on the head of the beast for a second; I doubt if I could have covered a barn-door in that first moment of alarm. But when I saw the tail of the animal moving to and fro, I knew—for I had read of the trait—that it was preparing to spring; and the emergency brought me to my nerve. My rifle settled down stiff, and I drew a fine sight between those glaring eye-balls, and "let drive."

It was not a second too soon; he was gathered for his leap as the gun went off, and when he came, with the ball through his brain, he fell within a yard of me, tearing the ground in his death-agony, and yelling so terribly that my boats' crew heard it clear down by the waterside, a mile away, and came tearing through the woods to see what trouble I was in. They helped me tote the beast out, and Jim Eagan, our pilot and guide, told me it was the biggest tiger he had ever seen. It measured over eight feet from its nose to the end of its tail and had claws that wouldn't have disgraced a *bona fide* lion from Central Africa. I killed one afterward in a fire hunt on Sanabel island, and they were the only two I ever saw in Florida. But I have since killed the same kind of an animal in Texas and in California, where they call them "lions." They are nearly identical with our northern panthers, but larger and more tawny in color. None of those that I killed had spots like the cougar of South America.

The able and pleasant letters of Doctor Henshall in the FOREST AND STREAM carry me back over pleasant cruising grounds. But the Doctor and his companions should have penetrated the Everglades, at least as far as Sam Jones', or Arpiaka's Islands. They would have been well repaid in the wondrous sawgrass for the trouble of poling a canoe through the winding channels.

NED BUNTLINE.

SHOOTING MATCHES.

FOUNTAIN GUN CLUB.—*Parkville, L. I., Jan. 14th.*—Match for gold badge; 7 birds each; 80 yards boundary, 1¼ ounce of shot, from 5 ground traps; ties decided at 5 birds each, and miss and go out; the use of both barrels of the gun allowed:—

	Yards rise.										*Killed.*
J. Sheridan	21	1	1	1	1	1	1	1	1	1	11
W. Garrett	25	1	1	1	1	1	1	1	1	0	10
Selover	25	1	1	1	1	1	1	0			6
Eddy	25	1	1	1	1	1	1	0			6
Pike	23	0	1	1	1	1	1	1			6
Heinstedt	25	1	0	1	1	1	1	0			6
Lemken	21	1	0	1	1	1	1	0			5
White	26	1	1	1	1	0	1	0			5
Smith	25	1	1	1	1	1	0	0			5
Livingstone	21	1	1	0	1	1	0	1			5
Ravenhall	21	0	1	1	0	1	1	1			5
Kearney	25	1	1	1	0	1	0	1			5
Bassett	21	0	1	0	1	1	0	1			4
Miller	21	1	1	0	0	0	1	0			3
W. R. Hunter	21	1	0	0	0	1	0	0			2
Slane	25	0	0	0	1	1	0	0			2

BROWN'S DRIVING PARK.—*Long Island, Jan. 12th.*—A team match was shot this afternoon which was replete with brilliant shots, and teeming with interest throughout in being (colerably) closely contested, and their being several friends of the contestants in attendance, it was not, like most long matches, tiresome and tedious. Mr. Allan Nichols was shooting in his best form, and with his scott "Bird-Catcher" made some remarkable shots, both as to distance and accuracy. Mr. W. R. Henderson, who has just returned from Europe, is not shooting in his old form, but is still hard to beat. The conditions were 50 birds each, handicap rise, 80 yards boundary, R. and T. traps, Long Island Gun Club rules:—

First Team.—Mr. Allan P. Nichols killed 15 straight; the 16th fell dead out of bounds; missed 17th, 36th, 37th, and 38th, killing 45 out of the 50. Mr. Wm. R. Henderson missed his 4th, 15th, 17th, 23d, 38th, 45th, 46th, 47th and 48th, killing 41 out of the 50. Total for team, 86.

Second Team.—Mr. Horace C. Wallace missed his 6th, 8th, 10th, 29th, 30th, 44th, 46th, and 50th, killing 43 out of the 50. Mr. James M. Morand missed his 13th, and lost 18th out of bounds; missed the 19th, 20th, 24th, 28th, 41th, 45th and 46th, killing 40 of the 50. Total for team, 83.

Referee—Leonard Brown. Time—3 hours and 25 minutes. Manager—W. E. Brown.

CENTRAL CLUB.—*Lansingburg, N. Y., Jan. 8th.*—The Central Gun Club contains among its members the sharpshooters of Rensselaer, Saratoga and Albany Counties. To-day's match was for the final possession of the badge and the best shot of 1879. The badge had been previously won by John Pickering, A. Paul, C. R. McDonald, Murry Campbell, Capt. King and J. De Goiyer. Walter Campbell won, and then the seven shot off for final and permanent possession. It was won by J. Pickering, who broke nine balls in succession. Following the shooting for the badge was a pigeon match; 10 birds each; plunge traps; 21 yards rise. The scores were: W. Campbell, 9; J. Pickering, 9; Thos. Curley, 8; Ed. Lansing, 8; A. Paul, 5; A. Wenterworth, 6; J. Grove, 8; M. Campbell, 7. On shoot off Pickering won first and Paul second. The officers for the following year were then elected: President, Edward Lansing; Vice-President, W. G. Campbell; Secretary, Archie Paul; Treasurer, Nelson Lewis, the veteran rifle shot, who managed to make it very warm for the members at the glass spheres. C. H. Y.

NEW JERSEY.—Middlesex Pigeon Club match at Tromley; 10 birds each, handicap rise, 5 traps, English-Hurlingham rules. The best scores were:—Mr. C. Woods, 27 yards, 9; Mr. W. Dot, 29 yards, 9; Dr. Mott, 28 yards, 8; Mr. W. Long, 28 yards, 7; Mr. W. Woods, 21 yards, 7, and Mr. D. Thompson, 30 yards, 6. The tie was shot off at 3 birds, the badge going to Mr. Woods.

NEW JERSEY—*Rutherford Park, Jan. 8th.*—Monthly match; Gun and Fishing Club; 16 yards; Jeaneret and Coe handicap 4 yards:—

Burgess	1	1	0	0	1	0	0	0			4
Woods	1	0	0	1	1	0	0	1	1		5
Lane	1	0	1	1	1	1	1	0	0		6
Counsmiller	1	0	0	0	0	0	0	0	0		1
Coe	1	1	1	1	0	1	1	1	0	1	8
Jeaneret	1	1	0	0	1	0	0	1	0	1	5

Counsmiller won the badge for the best shot, and Counsmiller wears the badge for being the worst shot.

KNICKERBOCKER YACHT CLUB.—*Port Morris, Jan. 2d.*—Pigeon matches shot by members of the Knickerbocker Yacht Club on club grounds, Port Morris, New Year's morning. The birds were very good indeed, the most of them being swift flyers. The first match was a sweepstakes; 10 birds; 21 yards rise; 80 yards boundary:—

F. B. Chedsey	1	1	1	1	1	1	1	1	1	1	10
T. T. Nixon	1	1	1	0	1	1	0	0	1	1	7
A. Steinke	1	1	1	0	0	1	0	1	1	1	7
J. R. Cole	1	1	0	1	0	0	1	1	0	1	6
A. E. Miller	0	1	0	1	1	0	0	1	1	1	6
D. F. Caughlan	1	0	1	0	0	1	1	0	1	0	5
T. N. Jacques	1	0	1	0	1	0	0	1	0	0	4

Second money was divided between Messrs. Nixon and Steinke. The second match was between J. R. Cole and A. E. Miller, for a purse of $25, each man shooting at five birds. The match was won by J. R. Cole killing his five birds; Miller killed three.

Match for $25, J. R. Cole and T. T. Nixon shooting against T. N. Jacques and A. Steinke; each at five birds; all the matches were shot with 21 yards rise and 80 yards boundary:

T. N. Jacques	4	T. T. Nixon	3
Aug. Steinke	4	J. R. Cole	3
	8		6

A. VARIAN, Sec.

Archery.

A RETROSPECT OF THE ARCHERY SEASON OF 1879.

LOOKING back over the archery season just past, the view is far from discouraging. While it is true that the pastime found favor in the eyes of many persons for two or three preceding summers, yet the summer just over witnessed the real beginning of the public archery practice in America. During the previous years very few matches were shot between societies, and no great associations were formed. In the last year, however, the National Association was formed somewhat upon the model of the Grand National Archery Society of Great Britain, and following it, the archers of the New England States and New York created the Eastern Archery Association upon a similar plan. The success of these two associations, together with the steady growth of the interest in archery, induced the formation of several State archery associations, and caused the birth of hundreds of new societies. No doubt it would be safe to say that at the close of the season of 1879 there were twice as many persons practicing with patience and persistence the difficult pastime, as at the corresponding time of the year 1878. So much for the advance in the way of numbers. Another marked feature in the past season appears in the superior class of archery goods used by the majority of archers. Two years ago the greater number of persons contented themselves with bows costing from four to seven dollars; now the average archer wields a bow valued at from fifteen to one hundred dollars. Formerly any sort of a stick would do for an arrow, now only the very finest footed, with parallel points, highly painted and gilded, and fledged with the best turkey or peacock feathers, are used. This advance in the character of weapons wielded by our archers is not the result of that vanity which leads to over-dress for show, but comes of the knowledge that good goods are high-priced ones, particularly in archery. Nor has the scoring been less gratifying in its improvement than the other features of the season. While, during the season of 1878, nearly all the archers practiced more at 40 yards than any other distance, yet only three archers, to the writer's knowledge, succeded in reaching 200 points, with 30 arrows, at that range. In the season just over, dozens of archers passed that score, although giving much less attention to this short range. At 60 yards, the shortest of the ranges of the York Round, and the longest of the American Round, only three archers, to the best of the writer's information, succeeded in scoring 140 points with 30 arrows during the season of 1878. In the season of 1879, however, more than thirty archers passed that point, and more than a dozen passed 150 points. At the 80 yards and 100 yards ranges, no shooting, or scarcely any, was done during the season of 1878; yet, ere the close of 1879, these two ranges became favorites with nearly all of the more advanced archers.

Not with the idea of making invidious comparisons, but only as examples of rapid progress in different and widely separated portions of the country, attention might be called to the shooting of Mr. F. C. Havens, of the Bow Club of Oakland, California, who, from very insignificant scoring in 1878, reached in the past season to an average scoring in 1879, reached in the past season to an average of 500 points at the American Round; once in a match shoot getting 581 points! This is admirable work, and since Mr. Havens is expected at the next National Meeting as a competitor for the prizes of the Association we may expect to see some shooting by him at the longer ranges proportionately fine. Passing eastward we might call particular attention to the wonderful improvement shown by Mr. O. W. Kyle, who took his first bow in hand in November 1878, and yet in November 1879, scored several times over 150 points with 48 arrows at 80 yards, and about the same value with 30 arrows at 60 yards. Among the members of the Buffalo Toxophilites several have passed 150 points with 30 arrows at 60 yards, several have passed 150 points with 30 arrows at 60 yards, notably Mr. F. Sidway, whose scoring is something remarkable for the length of his practice. Passing by the Wabash Merry Bowmen and the Kokomo Archers, as two of the older societies, we find at Cincinnati one archer, Mr. Adam Gray, who has stepped to the front rank so

suddenly as to be a surprise to every one. His score of 218 points with 30 arrows at 40 yards, at the Ohio State Tournament, was an exhibition of skill and nerve which marks him as a future figure in archery tournaments. The Arden Archers, of Marietta, Ohio, have given to fame the names of three archers at least of very high skill—Mr. L. L. Peddinghaus, Mr. Charles Slack and Mr. E. W. Deval, each of whom has scored above 150 points with 30 arrows at 60 yards. At the Ohio State Tournament, though shooting under difficulties, each of the two first named scored very close to 800 points at the double American Round, and lately we are astonished by the scoring of all three at the York Round, Mr. Peddinghaus getting two single Yorks in succession of 399, and 421 points—a double York of 820. The Toledo Archers, a young society organized in July, 1879, have shown wonderful advancement, Mr. Dean V. R. Manly scoring above 800 points at a double American Round. All honor to this band of brave young archers, which though only a month old had the courage to join the National Association and boldly contend for the prizes at the National Meeting at Chicago. It was an exhibition of true nerve, and the steady advance which they have made is no surprise to the writer. Among the eastern archers the writer is less acquainted, yet the fine scoring at the ranges of the American Round of Mr. J. O. Blake, Mr. W. Holberton, Mr. H. Innis, Mr. J. G. Johnson, and notably Mr. E. R. Dwight, who each passed 500 points at the double American Round at the public tournament of the Eastern Archery Association, deserves mention. All these archers are young in the practice, but their scoring gives promise of future excellence. Of course the archers above mentioned are only a tithe of the number whose scores have marked them as rapid learners of the art of archery, but enough have been named to prove the fact that the pastime has taken a long step forward during the past season. One marked feature of the last year has been the unanimity with which the more advanced archers have discarded the short ranges and practiced at the York Round, or at least at the 60 yards range. This is as it should be, and the good effects of it will be seen at the next National Meeting. The ladies have fully kept pace with the gentlemen in the general advance, and we could give many names among them which have attracted attention throughout the season, but we do not feel bold enough to particularize among the fair! We might say, however, that scores of 500 to 750 points at the double Columbia Round have been made by ladies of one season's practice, and two or three we know who at the 60 yards range have scored above 100 points with 30 arrows. Surely this is a remarkable record for a first year.

Besides many matches between teams of different societies, four great public meetings were held: the National Meeting at Chicago, the Eastern Archery Association's Meeting at Beacon Park, Boston, the Ohio State Tournament at Cincinnati, and the Pacific Coast Tournament at Sacramento, California. At each of these meetings great interest was manifested, the attendance of archers was large, and although the scoring was not generally up to the average of the practice scores of each archer, yet, taken as a whole, it was very satisfactory. The general result of the season has been the wonderful upbuilding of archery throughout the country. In the coming season we shall all have good bows, fine arrows, more practice at longer ranges, more matches and public meetings, and the year 1880 will fix archery so firmly in the affections of the American people that in after years its great tournaments will be the most attractive of all exhibitions of out-door pastimes.

WILL H. THOMPSON.

ARCHERY SCORING.

BOSTON, *Dec. 31st*, 1879.

Editor Forest and Stream:—

I am pleased to see the article of "Massasoit Bowman" in your issue of Dec. 25th. It is only by full and free discussion, and by having the points fairly presented on both sides, that the archers of our country are to be enabled to pass proper judgment on the new ideas which will undoubtedly be advanced in this Yankee land. I am aware of the risks and criticisms to which one is liable who advances or advocates anything in archery at variance with the methods which have come to us across the Atlantic. In archery, as in other sports, there are those who are prone to accept, without question, anything handed down from the ages, or coming from afar, as the *ne plus ultra*. It has the far-away odor of antiquity—possibly its only merit—and they seem to forget that there is something new under the sun—at least there are rediscoveries—for have we not just discovered some of the pleasures of archery? There are also those—and I am happy to think the majority—who are disposed to consider, and if apparently reasonable, to grant, a fair trial to new ideas, and to encourage home industry and talent. This has been well illustrated by the bow controversy in FOREST AND STREAM.

Now, I have good reason to believe that American makers can and do make good bows, and better ones than can be imported at the same price. I had a 40-lb. self-snakewood bow of domestic manufacture, which I used constantly for over five months, and shot with it over eight thousand times. It was apparently as good as the day I bought it, when the unlucky day came in which I broke two strings on the bow in quick succession, and, probably weakened by the breaking of the first, it could not stand the recoil when the second gave way. Many good bows are broken in this way, and I am of the opinion that the bows of any maker are liable to fail on use, there being so many things in the nature of the material used not discoverable in the shaping or finishing, and only brought out by repeated trials.

My interest in archery is not of the kind inspired wholly by the halo of antiquity and romance in which it has been handed down to us. It is more of a practical nature. The antiquity and romance are very good; but the practical utility in the benefits and pleasures to be derived in its practice, and its adaptability to all who choose to make it their exercise and recreation, are, I think, greater recommendations, and its strong hold on those who enter into the sport. We are not the people to stand still and take the "say so" of another as an accepted fact. On the importation of rifle-shooting some years since, did Americans continue on only in the beaten path of English method? Was there not a most radical change made, and our teachers taught to load at the other end? And have not the rifle clubs given up those targets with twelve rings, and valued from one to twelve, for the target with five rings, valued from one to five, for exactly the same reason that I advanced in support of my proposition? My statement was:—"The adoption of such a change would make no radical change in the comparative value of scores; but it would give to scores having a large number of hits, with few golds and reds, an equity which they deserve, especially for long-range shooting, and would bring the actual scores to a better per cent. of the possible score." Probably I did not make myself as clear on the subject as I should have done. "Massasoit," and also a brother archer in a private letter, both seem impressed with the idea that I propose having the greater number of hits count the highest score; but it is not so, for in that case there would be no necessity of values for the different colors. The present proportionate value of colors is:—gold 36, red 28, blue 20, black 12, white 4 per cent. The new values would be:—gold 53⅓, red 26⅔, blue 20, black 13⅓, and white 6⅔ per cent. This change would take 2⅔ per cent. from the gold, 1⅓ per cent. from the red, and add to the white and black respectively, and as I before stated, there will be no radical change in the comparative value of scores. The larger score will be the larger score still, save in such a case as noted; and I yet think that as between 50 hits, value 202, and 55 hits, value 201, the 55 hits the best shooting, though with the re-valuation it would score but one point over the 50 hits. To illustrate the per cent. of increase in the possible scores I give the following from my reply to the private letter ou the subject. Two scores were submitted, figured at the old and my proposed values, viz.:—

Hits.....	29	Value.....	147	New Value.....	87
Hits.....	30	Value.....	122	New Value.....	76

I find that 76 is 2 1-3 per cent. more of 122 than 87 is of 145, showing that per cent. of increase to the 30 hits. To figure another way:—145 is 18.8 per cent. larger than 122, while 87 is but 14.4 per cent. larger than 76, showing in this way a gain of 4.4 per cent. to the score having the greater number of hits, but in the lower color; and I also find in per cent. of possible scores a gain in both; to the 29 hits a gain of about 3 per cent., and to the 30 hits about 11 per cent.

"Massasoit" will thus see that I would not do away with the comparative results, even in his hypothetical case, unless there was a wide variance between the number of hits, and to argue the case on averages is exactly what I propose to do to substantiate my proposition. The unusual scores cited was to show that there were cases deserving of an equity, not to be had in the present valuation.

Be it remembered, I referred to long-range shooting, viz.: the York Round, which will be the distances mostly used in competition by our archers. At this round the possibilities are largely in excess of the probabilities, with one exception—Ford's unequal score of 1,241 at the Double York Round; the highest scores made in England for many years average less than five to a hit, showing that there are more hits in black and white than in gold and red, by their best archers; and the average is much less. This being the case, and there being a possibility of a chance gold counting more than two blacks and two whites, I submit that chance may carry off the palm as against merit; that the chance would be lessened by the valuation, and an increase made in actual score in their per cent. of possible score. "Perfection is our aim," says "Massasoit." Yes, I answer, and to that end let us do those things that will bring us as near perfection as possible. In this long-distance shooting one may feel proud of the day that the majority of his shots hit the target and "approximate the mark;" and to such the premium is due in relative proportion. Let us not continue a premium to chance by the excessive valuation of a portion of the largest. A. S. BROWNELL.

AMERICAN VS. ENGLISH AGAIN.—*New York, Jan. 9th.*—*Editor Forest and Stream*:—Will you kindly allow me a little space in your valuable paper to say a few words in answer to "N. K. D." on the subject of bows, although his letter contains nothing new, not even the puff given Mr. Aldred; only some of his statements are so contrary to the experience of the archers in this part of the country that they ought not to be passed by. I have handled very many of Mr. Aldred's bows, which are undoubtedly as good as those of any English makers, and know they do not stand this climate; on the contrary, the universal complaint is, that they break very easily. Members of the Buffalo Club, the Oritani Archers, and many others, will bear me out in this statement, and as to yews, I do not think I ever saw a yew that had outlasted two seasons' work. As to Spanish yews, costing only $20 landed here, I doubt. They cannot be sold in London for less than $30 or $40, and then they are far from first-class. Mr. Carver told me his bow cost $125. As to the bow making the scores, I refer him to Mr. W. B. D. Gray, whose score (the highest) he publishes in his article. Mr. Gray, the champion, won his prizes with a cheap lancewood.

Can Mr. Kyle give us an authentic statement of the arrows shot with his Spanish yew, and can he beat Mr. Beecher's record of over 8,000 30-inch arrows, shot with his split-bamboo? See FOREST AND STREAM of last week.

As to American makers overcharging, I am afraid "N. K. D." is not posted. He can buy a good bow of American make for $2.50 to $4.50. I had one in use for one season which cost $4.50; it pulls forty-nine pounds and is as good as ever.

Yew bows are going out of use more and more. Many an archer who has paid $30 to $100 on yews has given them up in disgust and taken to American bows made by manufacturers who have confidence enough in their work to warrant against breaking.

W. HOLBERTON.

NATIONAL ARCHERY ASSOCIATION.—The regular annual business meeting of the National Archery Association of the United States will be held at the office of Henry C. Carver, Esq., Corresponding Secretary, No. 25 Wabash avenue, Chicago, Illinois, on the 28th day of January, 1880. Besides the regular election of officers for the ensuing year, much business of importance will come before the Association, and it is desirable that every Society which is a member of the Association be duly represented by its proper delegate.

HENRY C. CARVER, Corresponding Secretary. MAURICE THOMPSON, President.

CHRISTMAS SCORE.—*Chicago, Dec. 25th*, 1879.—The team of the Northside Archers shot three scores of 30 arrows each at 40 yards:—

	1st 30.		2d 30.		3d 30.		Total.	
Mr. Hope	30	168	30	198	29	191	89	557
Mr. G. Conklin	30	159	27	145	28	160	84	464
Mr. J. Wilkison	30	168	24	136	27	155	81	459
Mr. W. Conklin	24	128	23	116	25	127	72	370

NEW YEAR'S SCORE.—Wabash Merry Bowmen—York Round:—

	100 Yds.		80 Yds.		60 Yds.		Total.	
Will H. Thompson	31	147	38	178	20	94	89	389
Maurice Thompson	36	102	34	174	20	86	80	362
Theo. Meehan	19	83	24	88	21	83	64	254
John A. Bane	13	51	29	119	19	79	61	249
W. E. Brewer	22	90	18	56	20	94	60	240
M. C. Klein	9	33	13	45	17	75	39	153

During the shooting at the 80 yards range Maurice Thompson got a score of 50 with six successive arrows—four golds and two reds. The day was very fine for the season.

THE FIVE JOLLY ARCHERS.—*Rochester, N. Y. Jan. 10th*, 1880.—Four members of the Five Jolly Archers Club, of this city, had a practice shoot on the afternoon of January 9th, for the first time since November 1st. Only 25 arrows were shot, owing to darkness coming on; 30 yards; 27 inch target; with the following result:—

	Hits.	Score.		Hits.	Score.
Mrs. W. R. Lansing	25	140	Forbes Potter	23	150
Clarence Williams	24	138	W. H. Reid	24	139

This is the first season of the Club's existence, although some of the members have had some previous practice. During the past summer we have done better shooting than the above, but we think this fair, after so long a rest. W. R. L.

Yachting and Boating.

YACHT RACING ASSOCIATION.

Editor Forest and Stream:—

The article in your paper of last week under the heading, "Failure of the Y. R. A.," was published under a misapprehension of the facts, and is calculated to injure both the object and those gentlemen who have given so much time and study to the matter during the past year. It is not consistent with reason that a paper so ably edited as FOREST AND STREAM, the chief object of which is to cultivate a taste for healthy sports, would willfully attempt to crush an effort to increase the interest in one of the most manly and health-giving of all the pastimes advocated in its columns.

Your opposition, therefore, is due, no doubt, to a mistaken belief that the delegate representing a Brooklyn club was the active agent in this movement, and that in your estimation he was not a proper person to follow. Without assuming anything in reference to the character or standing of the delegate to whom you refer, I simply desire to state the facts, and to ask you, in the name of justice and fair dealing, to give us a hearing.

The idea of forming an Association, or Yachting Congress, composed of delegates from the various clubs in and around New York, originated with the New Jersey Yacht Club more than a year ago. They published several articles in the New York papers and sent a printed circular to the yacht clubs in New York and vicinity. The Columbia Club seconded these efforts almost from the beginning, and upon it has devolved the greatest amount of labor.

At the first call for a meeting of representatives, nine sets of delegates appeared. A delegate from the Salem (Mass.) Club advocated a National Association, which met with unanimous approval. A Brooklyn representative offered the resolution appointing a committee to draft an address to the yacht clubs of the United States. This committee was appointed by the Chairman, and consisted of one from each of the clubs represented. Mr. John Fyick, of the Columbia, prepared the address, and it has been sent all over the United States. Already many favorable responses have been received, and had it not been for the article in question, the delegates would have been called together about the 25th inst.; but doubtless they will deem it best, under the circumstances, to delay the call until February, in order to give those clubs who may have been influenced thereby an opportunity to be represented.

From this you will readily perceive that the person to whom your article referred has had very little to do so far in this effort to build up a National Association composed of representatives of clubs from all parts of our country

New York, Jan. 12th, 1880. ONE OF THE COMMITTEE.

The above came to hand shortly before going to press. As it explains the position of affairs fully, we are glad to insert it.

The only complaint we have to make is that this and similar explanations were left till the eleventh hour, virtually compelling us to give voice to the objections made to the movement by a portion of the public. Our correspondent is right in his surmise that the only objection on our part was caused by the presence on the Committee of a person distasteful to honest people. As his influence has now been effectually killed, we call upon all yacht clubs to give the proposed Y. R. A. the fullest support, and to aid in bringing about the great boon of united action and legislation among yachtsmen.

THE PEERLESS.—This famous racing schooner has been sold to Francis Hathaway, of New Bedford, Mass. Mr. Maxwell, her former owner, is building a new schooner, eighty feet long, full description of which will appear in this journal.

THE ELEPHANT.—This sloop, formerly the property of Mr. J. G. Prague, has been sold to Mr. Johnson, of Poughkeepsie, and "up-river" yachtsmen will learn what a flyer she really is. Mr. Prague is having a larger ship built, of which more anon.

THE EMBASSADRESS.—Mr. Astor's big schooner has been laid up at City Island. She left St. John's River, Florida, Dec. 30th, 1879, and reached this port Jan. 8th, after seeking shelter under the lee of Delaware Breakwater Jan. 6th, from a heavy northeast gale and high cross sea. Report says she behaved admirably, though she seems to have labored and rolled heavily. Her owner and friends came home by rail.

ANNUAL RACING RECORD.

LIST OF WINNING YACHTS, 1879.

THIS list will be found nearly complete, excepting in such unavoidable omissions, as arise from the causes mentioned in the heading to the list of races. The columns of owners and rigs are filled in where known, but are too frequently omitted in reports of races. The length on water line is given in feet and inches, where known. O. or U. before the length signify over or under that length ; a dash connecting two figures, that the boat's length is somewhere between the two ; S. L., sailing length (mean) ; O. A., length over all. Yachts of the N. S. Y. S. and a few others have their tonnage in place of their length given ; a T. after a figure signifies tons. In the column of rigs : Schr., schooners ; Str., steamer ; Slp., sloop ; Cut., cutter ; Cata., catamaran ; D. E., double end ; T. U., tuck up ; I. B., ice boat ; Whl., Whitehall boat ; Bat., batteau ; Spt., sprit sail ; O. B., open boat. When the boats are connected by a dash, it signifies a doubt as to there being one or two boats ; when two rigs, owners or clubs are put against a name, it signifies that the rig, owner, or club was changed during the season. A * means one race out of a series won, not giving a prize ; a † means champion. The championship of the D. Y. C. was won by two races ; also those of the Q. Y. C., the Salem Y. C., and that of the B. Y. C. by two in first class, and three in the others. But this latter was for *actual time*, and regular prizes were given for corrected time ; 4th or 5th in the column of third prizes, means a fourth or fifth prize. In the column of length, 1st c, 2d c, etc., indicates first class, second class, etc., where lengths as not known.

In a few races where two distinct prizes, under separate conditions, were sailed for at the same time with allowances, two races have been been credited to the participants. For example, in the D. Y. C. regattas the races for the club prizes and the Sharp pennant are counted as two races ; but if one prize was given for actual and one for corrected time, as in the B. Y. C. championship races, only one race is credited.

Name	Club or Port.	Owner.	Rig.	Length.	Number of Races Sailed.	Number of Times 1st Without Allowance.	Number of Times 1st With Allowance.	First Prize.	Second Prize.	Third Prize.

* In the race of the Nahasset Y. C., Sept. 6th, a question arose as to the time of *Axis* at the start. It is yet undecided. The first and second prizes were taken by *Axis* and *Psyche*, but which takes the first is yet in doubt. The question marks in *Psyche*'s and *Axis*'s lists refer to this race.

** *Sadie* was awarded first prize as Marblehead, June 17th, in the "dory" class. As she is not a dory, the prize is not counted.

PUBLISHER'S DEPARTMENT.

BETHABARA WOOD FOR RODS.—We recently handled a lot of this wood at A. B. Shipley & Son's, of Philadelphia. A strip six feet long, and an eighth of an inch thick, was bent into a hoop, and flew back straight as an arrow. It seemed to us that it could have been tied into a knot with the same result. This wood, we are informed, comes from British Guinea, and is used in rod making. It is beautiful to work, polishing like bone; has a long fibre, and is highly elastic. Its chief virtue is, that when made into rods, it will not set or lose its arrow-like straightness when hard used or exposed carelessly to excessive heat or moisture. A gentleman in Springfield, Mass., who is a prominent archer, writes as follows about this wood:

"I have made a bow entirely of it, and five double bows with hickory backs. As I have told you, I am an enthusiastic archer, and I have tried many woods, and many bows, and from all tests the Bethabara has come out ahead, and I will back it against any known wood for long bows. I have sold two backed bows to gentlemen, in other clubs than my own, and they are superior to Highfield's London bows, weight for weight."

DANGER SIGNALS.—Five eminent men have died within the past few weeks of Bright's Disease, and many more will soon die of the same fearful destroyer because they do not take Warner's Safe Kidney and Liver Cure, the only sure remedy for this and other kidney and liver diseases.—[*Adv.*

—The National Railway Publication Company, who publish the Travelers' Official Railway Guide, the Rand-McNally Official and Railway Guide and Hand-Book, have removed to 46 Bond street, New York.

A DOG UNDER SCIENTIFIC MEDICAL TREATMENT.—Thos. Murphy, of 661 Cass avenue, Detroit, had a fine dog, which was the playmate of his children, but it was stolen some days ago and sold to the janitor of the Detroit Medical College for the purpose of vivisection. Mr. Murphy learned of the whereabouts of his pet and at once called on the college authorities. The experimenter was produced, and it was learned that a portion of the dog's skull had been removed and part of the brain taken out. Mr. Murphy begged that the dog be destroyed at once, and the Professor of Physiology, noticing the evident distress of Mr. Murphy, assured him that he knew nothing of the history of the animal, but promised to undertake to restore the animal to health and to its owner. The dog was put under a course of scientific treatment, and the case is to-day most interesting.

Forest and Stream and Rod and Gun

AS WE do not employ any authorized agents or canvassers, we offer our friends in every locality who will give any time or attention to collecting and forwarding subscriptions, the following inducements to obtain subscribers for the "FOREST AND STREAM" at the rates and commissions given below:

Collect Subscription price,	3 months, $1.00	6 months, $2.00	1 year, $4.00	2 years, $7.00	3 years, $10.00
Commission to be retained,	3 " .25	" .50	1 " 1.00	2 " 1.50	3 " 2.00
Amount to remit us,	3 " .75	6 " $1.50	1 " $3.00	2 " $5.50	3 " $8.00

Condition to the above Commissions, we offer the following CASH PREMIUMS:

To the person sending us the largest amount of money obtained from new subscribers, whose names are not now on our books, at above net rates, between January 1, 1880, and July 1, 1880, ... $100.00
To the one sending the next largest amount, in accordance with the above conditions, ... 75.00
To the third on the list, ... 50.00
And to the fourth, ... 25.00

Subscriptions may begin at any time during the year, and may run for any length of time, but no subscription will be entered on our books until the money for the same has been received at this office.

No commission will be allowed on the first SINGLE subscription, but the commission due on the first two subscriptions may be deducted from the second, and thereafter the commission can be retained on each succeeding subscription. You are sure of the commission which you retain, and also have an equal chance to get from $25 to $100 of the cash premiums in six months.

Sample Copy, Subscription Blanks and a handsome Show Card (to be posted in a conspicuous place) sent free on application.

Write your name and the name of the person to whom the paper is to be mailed, plainly, and do not forget POST OFFICE ADDRESS, TOWN AND STATE.

Remit, if possible, by postal money order, check, or draft on New York, payable to order of FOREST AND STREAM PUBLISHING COMPANY. If neither money order nor draft can be obtained, enclose money in Registered Letter

"THE FISHING LINE."
TAKE THE
Grand Rapids & Indiana R.R.
Mackinaw, Grand Rapids and Cincinnati Short Line
FOR THE
Trout, Grayling, and Black Bass Fisheries,
AND THE
FAMOU SUMMER RESORTS AND LAKES
OF
NORTHERN MICHIGAN.
The waters of the
Grand Traverse Region
and the Michigan North Woods are unsurpassed, if equaled, in the abundance and great variety of fish contained.

BROOK TROUT abound in the streams, and the famous AMERICAN GRAYLING is found only in those waters.

The TROUT season begins May 1 and ends Sept. 1.

The GRAYLING Season opens June 1 and ends Nov. 1.

BLACK BASS, PIKE, PICKEREL and MUSCALONGE, also abound in large numbers in the many lakes and lakelets of this territory.

The sportsman can readily send trophies of his skill to his friends or "club" at home, as ice for packing fish can be had at many points.

TAKE YOUR FAMILY WITH YOU. The scenery of the North Woods and Lakes is very beautiful; the air is pure, dry and bracing. The climate is peculiarly beneficial to those suffering with

Hay Fever and Asthma Affections.

The hotel accommodations are good, far surpassing the average in countries new enough to afford the finest of fishing.

During the season Round Trip Excursion Tickets will be sold at low rates, and attractive train facilities offered to Tourists and Sportsmen.

Dogs, Guns and Fishing Tackle Carried Free at owner's risk.

It is our aim to make sportsmen feel "at home" on this route. For Tourist's Guide (an attractive illustrated book of 80 pages), containing full information and accurate maps of the Fishing Grounds and Time Cards, address A. B. LEET, Ger. Pass. Agent, Grand Rapids, Mich.

Volume 13—No. 25. No. 111 Fulton Street, New York

The East Branch of the Penobscot.

TWO HUNDRED MILES THROUGH MAINE IN A CANVAS CANOE.

A DESCRIPTION of our first camp in the woods will acquaint the reader with the arrangement of the many after, and make him familiar with the picture of our daily surroundings.

Our wall tent, 10x12 feet, was soon unfolded, and selecting a prominent point of the high bank which commanded the river, we immediately set about cutting the three necessary poles on which to erect it. We trimmed all projecting twigs from the ridge and front upright poles, but left them on the rear one, that we might make it useful on which to hang cups, belts, candlesticks and lanterns. Here the Quartermaster's whittling propensity came in use, and another pole was notched by him and pressed into service inside the last, which served as a rack for our guns and rods.

Great care was taken that the notches which held the ridge-pole were not too long, or they would tear the tent, and that the angles of the roof should accommodate any passing shower. Then we cut short pins from the white birches, and with the ropes at the sides soon drew the tent into position. While Bowley (our cook) was making bread and coffee, frying salt pork and trout for our evening's repast, the resounding blows of Waller's axe could be heard in the forest, gathering logs for the camp fire, and Morris was cutting fir boughs for the historic camp-bed. It is wonderful how comfortable a bed this makes, while its delightful, health-giving odor is so invigorating to the system. Our table outside the tent was usually made of four forked sticks, on which we put others crosswise, and on these we laid splits of wood; and for seats, rolled into position a convenient log, or used the many wooden pails containing our provisions. On rainy days we sat on the ground in the tent, and used these pails of various sizes and heights as an extension table, smiling to think how easily we could conform to any condition in the woods. At the head of the tent a choice position was given to our photographer's camera and chemicals, together with our travelling bags, rifles, cartridge boxes and books, while at our feet was distributed the pails of provisions and heavier part of our "kit." About one and a half feet was allowed to each man for sleeping accommodations, an imaginary line only dividing off the guides, we being arranged somewhat similar to sardines in a box—only our heads were all in one direction. Immediately after leaving camp the next morning we entered the "rips," or rough water of the river. For about ten miles there was little necessity of paddling, the velocity of the stream sweeping us along without extra effort. These last few miles were very exciting, as following in the wake of the birch canoes, we guided our canvas craft past boulders and sunken rocks, while the guides, constantly on the alert for our welfare, shouted or waved their hands to warn us of dangerous places.

Passing close to the bank on the left of the boisterous water, we shot the Pine Stream Falls, and soon rested in the foamy waters below, where our Artist at once immortalized the party. The amount of strength and activity displayed by the guides in handling their canoes past falls and rapids is astonishing. With their slender "setting poles," eleven feet in length, armed at one end with a sharp iron spike of six inches, they will steer the canoe with unerring certainty, or hold it quivering in waters that would seem to engulf it.

A hasty lunch, and we soon reached the mouth of the east branch (eighteen miles from the Northeast Carry), where a scene of special beauty burst upon us in the white-capped waves of Chesuncook Lake and distant view of Mount Katahdin and the Sourdnahunk range. Paddling across the head of Chesuncook Lake, which is seventeen miles in length and three miles in width, we passed the mouth of Caucomgomoc Stream, and entered the Umbazooksus River. We had hardly recovered from the exertion in crossing the lake when we espied in the tall meadow grass on the bank of the stream a large black bear, who, standing on his hind legs, nodded an approving welcome. The quickness with which he dropped on his four feet and plunged into the thicket, gave us little opportunity to return his compliments with our rifles.

Another camp, and the next day we passed in safety the Umbazooksus Stream and Lake, and at 8 A. M. arrived at the long-dreaded Mud Pond Carry. This path through the woods to Mud Pond is a little over two miles long, and is detested by tourists, and execrated by the guides. Many weeks before my departure for Maine I had been accosted by a friend (who had made the St. John's trip), and asked to give him, on my return, the full particulars of my experience on this "carry." I was not, therefore, taken by surprise, but was prepared to meet it manfully on its own ground, and fight the battle to the best of my ability.

I had provided myself for this special undertaking with long rubber wading pants, or stockings, reaching to my hips, and further incased my feet in a heavy pair of canvas hob-nailed shoes: the latter I also found useful in wading streams. Even while selecting our provisions at the Kineo House, this and that luxury had been debated upon or withdrawn as an article too heavy for transportation on Mud Pond Carry. Its obstacles to our senses had also been made prominent by the daily conversation of the guides, and our imaginations of that gulf greatly awakened. On reaching the portage the canoes were drawn ashore, turned over to dry, goods removed, and each one selecting what he could support, we started off, Indian file, to make the best of the difficulties. On the right-hand side of the path, within a few rods of the Umbazooksus Lake, will be found a cool and refreshing stream of water, at which we quenched our thirst. At first the path was dry, and only occasional pools of water, easily turned, interrupted our advance. But soon the pools grew thicker and thicker, lengthening to greater extent than before, and with our loads on our backs we plunged forward, sinking time and time again to our knees in the soft muddy water. It makes a deal of difference, the nature and position of the load on one's back, and whether it is steady in its position or has a shifting propensity. I have known a pair of oars dodging about on one's shoulders to be heavier and more inconvenient than five times that burden in guns and ammunition. I had selected as the task for my left shoulder my shot gun, and attaching to it, a broiler, coffee-pot, gridiron and other impedimenta of camp and cooking utensils, detailed to the right a bag of 200 shot and rifle cartridges. Picture not only one but six man so loaded, forcing their way through the muddy path, slipping and floundering, first on one side and then on the other, under the conglomerated load of "camp kit." An opening in the dark, hot woods, half way across, and our burdens are lowered to the ground, to return to the lake for another cargo. A lunch, and on we go another mile, when the branches lock closer and closer about us, making our load seem double its weight, until with joy we discover from a slight elevation at the end of the "carry" the tranquil surface of Mud Pond. A portion of this course is evidently at some seasons of the year the head of a brook, and the writer found in a small isolated pool of water, only a foot square, a lively trout four inches in length.

Our guides told how, during some months of the year, they had dragged their boats two-thirds of the way across, remarking that the only dry part this year was the temperate way in which they were treated.

The canoes on the guides shoulders were the last loads to cross, and as it was now 6 P.M., one can make some estimate of the work done, seeing we had only accomplished two miles that day.

Launching our canoes on Mud Pond, some two miles in width, of uninteresting scenery, we bent our remaining energies to the reciprocating paddle, and were soon on the other side and canoeing the sluggish waters of Mud Pond Stream. Its mouth was clogged by great weather-beaten logs, which necessitated the laborious use of our axes before forcing a passage into Chamberlain Lake. The sun was hardly half an hour above the horizon as we crossed this beautiful lake, two-and-a-half miles to the opposite shore, and camped on its white pebbly beach at the foot of a farm. This was the only one of three habitations which we saw on our trip, and the delight which we experienced was as great as the recovery of a lost trail in the woods by the tourist mentioned in the following incident: A brother angler, while on a lonesome path in this very neighborhood, found one day a piece of birch bark nailed to a tree on which was inscribed these familiar lines:

"This is the way I long have sought,
And mourned because I found it not."

Chamberlain Farm consisted of one log house, eight or ten barns, and about three hundred acres of cleared land, if, where in some portions you can jump from stump to stump may be called "cleared land." The buildings are situated on a hill fronting the lake and command a view of the greater part of the water. Mr. Nutting (who with his three sons has charge of the farm,) is six feet high, straight as an Indian, with heavy high cheek bones, black moustache, and his face is thoroughly tanned by exposure to the sun. The farm with others in this vicinity is owned by Messrs. Coe & Pingree, of Bangor. Maine, who possess vast tracks of this wilderness, which they lumber and pass the result of their efforts to the markets along the coast of the State. During the summer months the product of the farm is gathered into the barns and is used to feed the hundreds of "log drivers," who, in the winter and spring are annually sent to this region. These "loggers" are a hardy set of men, receiving $1.50 a day when "on the drive," and work from 2 A.M. to 10 P.M., often exposed to great perils and the inclemency of the weather. Large herds of cattle and sheep are pastured here, and on the hill at the rear of the house I noticed a number of mules. The two-story log house in which resides Mr. Nutting, is painted an Indian red, and has the only embellishment of any of the buildings. The interior is whitewashed and has three rooms on a floor. The room into which our party was ushered had low ceilings of heavy logs, blackened by age and smoke from the big square iron stove, which held indisputable possession of the centre of the apartment. In one corner was a great box containing wood, which also served as a bed when other accommodations were not available. From the ceiling, hardly seven feet high, was arranged the clothes line, on which hung a portion of the week's washing, while the floor was made of logs with enough openings between them to admit plenty of fresh air. Artistic taste had not been wanting in the decoration of the log walls, and engravings cut from illustrated papers were tacked thereon, while in a prominent position was hung the portrait of a late unsuccessful candidate for Presidential honors. Rough shelves nailed to the sides of the walls between two windows supported a roll of old papers, a Webster's Dictionary, National Fifth Reader, Greenleaf's Arithmetic, and a Bible and Testament, while at their side hung a mirror and the family hair-brush and comb. But the most novel article in the room was a fly-trap, which, although it displayed the inventive genius of the locality, can hardly have its model on the many shelves of the Patent Office. This fly-trap hung from the ceiling near the stove, and was manufactured from two shingles fastened together at the butts like an inverted A. On the inside was spread molasses, and as fast as the insects became interested in its sweets, it was the duty of the passer-by to slap the boards together and destroy their contents. In addition to superintending this farm and stock, it is the duty of Mr. Nutting to provide for the various logging camps in the neighborhood, and to watch for the first indication of fires whose destructive power in the pine forests he fully realizes. Chamberlain Lake, on which we had pitched our tent, is fifteen miles long and three miles wide. It has an area of twenty square miles, is 1,134 feet above tide water, contains a number of islands, and took its name from an unfortunate man lost some years since on its shores. Years ago a large dam was built at its northern outlet into Eagle Lake, and the water driven back south through an artificial cut between Telos and Webster Lakes, thus enabling the lumberman to "drive" his logs to a home market, through the East Branch of the Penobscot River, instead of by the St. John's route to the foreign one of New Brunswick. It costs $50 a ton to transport supplies to this farm, and flour can be purchased here at $19 a barrel.

After our labors on Mud Pond Carry we rested here three days, taking photographs of the scenery and making excursions to the dams between Chamberlain and Eagle Lakes, where we found plenty of exercise for our trout rods. We also "sacked" our canvas canoe across the hills on the east to Indian Pond, in search of wild ducks and trout, but were only rewarded by a study of natural history, which seldom happens to the forest lover. Our discovery was a family of loons, or the great American diver, a bird the size of a goose, and the finest on inland Northern waters. It could be honestly said "they lived in flats," as their rough nest, composed of sticks and moss a foot in height, and two feet in width, rested on a flat, sandy knoll which stretched out into the water. Against the unmistakable dislike of the parent birds, I paddled to the front door of their house, and gazing in, discovered a recently hatched bird and one egg. The egg was dark brown, spotted with black, eight and seven-eighth inches at the longest, and seven and one-quarter at the shortest circumference. The young bird had every appearance of a gosling, with down of a greyish black, and did not seem in the least annoyed as I stroked its glossy coat. Withdrawing my canoe and creeping quietly back into the thicket, I enjoyed the lesson in frog catching taught the young one by the old birds, and I left them undisturbed in their happiness. It was with great reluctance we broke camp early on the morning of August 12th, rolled our tent, and arranging our kit in the canoes, paddled out into Chamberlain Lake, and bid farewell to the scenes around which clustered so many pleasant memories.

The fresh milk, butter, and eggs of the farm were a happy relief to our regular fare of salt pork and hard-tack, while the fresh straw which Mr. Nutting so kindly offered us from his barns, added greatly to our comfort,

But we had not started with the idea that in this wilderness we were to enjoy all the dainties of life, for in order to explore its depths we must give up luxuries and comforts which at home seem indispensable. How often in my earlier years, while pursuing the study of geography at school, did my pencil in drawing maps wander over this endless track of territory to the north and east of Moosehead Lake, striving to picture to my imagination its elements.

This great lake near the center of the State, together with a few of the largest rivers, of whose source there seemed a doubt, were about all that relieved the picture, and even now I was daily discovering that the latest published maps, which I had purchased before starting, were very inaccurate. Through the long stretches of deep water of Chamberlain Lake we paddled, keeping time with our oars, while on our right arose the peaks of the lovely Sourdnahunk Mountains, each individualized by the bright rays of the morning sun.

Entering Telosmis Lake, which is about a mile in extent, we sailed swiftly through its quiet waters and passed into Telos Lake, where at the mouth of a brook on the right hand we were successful in landing a fine lot of trout, which averaged over a pound each. Telos Lake is four miles long and about half a mile wide, and is 914 feet above tide water; its northern shore rocky and abrupt in comparison with the sandy and uninteresting nature of its south coast. The mouth of the canal, or "cut," at its foot is clogged with immense quantities of flood-wood, old logs and stumps bleached to whiteness by the action of the weather, which give it a weird and ghostly appearance against the background of verdure. This "cut" was dug by lumbermen some forty years ago to pass their logs into the East Branch of the Penobscot; but below the old dam, a quarter of a mile distant, one would never suspect by its natural and picturesque shore it was the work of men's hands, the force of water having relieved its sharp outlines. While our Artist was preparing his camera for a photograph of the "cut" and lake our guides "sacked" their burdens and canoes across the *chevaux de frise* of old stumps into the "cut," and we pitched our fourth camp on the high bank to the right of the old Telos Dam.

Although we had been out fourteen days we had so far been very fortunate regarding the weather; but we here experienced the first rain-storm of the trip, a genuine northeaster of three days' duration. We had hardly raised our tent and got our "kit" under cover before the watery contents of the heavens began to descend, and we took extra precautions to make ourselves comfortable and endure the trial in the most cheerful spirit possible. But I will not detain the reader with every item of the three days' imprisonment.

Encased in our waterproofs we resorted to the dam, caught trout, or wandered beside the waters of Telos stream for duck and partridges, giving little heed to the elements.

It is amazing how little one makes of discomforts in the woods, provided he sympathizes with his surroundings; but to a nature lacking either poetry or romance, to whom a fall is only a suggestion of water-power and a tree so many feet of lumber, the situation is unendurable. Here our canvas boat was overhauled, cuts sewed and waterproofed, birch canoes pitched, buttons adjusted to our clothing, socks darned, guns and rifles cleaned, while the Quartermaster busied himself ingeniously cutting pliers, scissors and vices from wood, cutting the joints of the same piece, as souvenirs of the locality.

But the storm had one good effect—it nearly exhausted the moose and bear stories of the guides, and left them in the future only the current topics of the day to discuss. So far the days had been exceedingly warm, thermometer 60° to 70° in the shade, but what was our surprise on arising early on the clear, bright day of Aug. 16th to discover a heavy frost and the ice in our camp pails an eighth of an inch in thickness. We were first aware of the event by the exclamations of our cook, Bowley, who was slipping about on the frozen ground outside, and to our incredulous replies lifted into the door of the tent one of the frozen pails by the tin dipper, which adhered to its surface. The tent was quickly "struck" and dried, and rolling into our rubber blankets and bags our effects, we were cutting the waters of Telos Stream and soon emerged into tranquil Webster Lake at its foot. The brook is about a mile long and very shallow, and but for the late rain would hardly have been navigable. An easy "carry" of a mile can be found through the tall grass and woods on the right-hand side, which also terminates at the head of the lake. It is very essential to one's happiness in making this tour to know on which side of the stream is the best portage around a fall or rapid, for the knowledge saves many a laborious walk when one's shoulders are loaded.

Webster Lake is a charming little sheet of water about three miles long and perhaps half as wide, which is wooded down to its very edge. At its foot is another of these series of logger's dams about twelve feet high, and on the extreme high bank to the right we again pitched our tent. Great care had to be taken with our fires along the road, that not a remnant of them be allowed to remain, and the indications are often very delusive. Many years ago a fire started in the woods on Eagle Lake, and the devouring flames sweeping southward over fifty miles to this section, destroyed this dam, which has since been rebuilt. There are many decayed and deceptive logs about these old dams, some over a foot in diameter, at which a slight pressure will crumble and plunge one into the deep water below. I speak from experience. A bear story is always welcomed in camp, not only on account of the truthfulness attending the first one, but because the doubts which hover around the succeeding tales add to their interest.

We stretched the canvas of our tent at this place, and while each one was engaged in his various duties, Weller, the guide, pail in hand, sallied out for fresh spring water. He had hardly disappeared from our sight when with immense jumps he came tearing back through the bushes shouting, "A bear! a bear!" A rush for our rifles and a forward movement into the woods, but after an unsuccessful tramp the she bear and two cubs seen by our friend could not be found.

Before we left the wilderness we had the unspeakable pleasure of making the acquaintance of some six bears, but on every occasion we were without our rifles, and when we made an effort to hunt them they were not to be found. We were either shooting a quick flowing stream, and with difficulty keeping our canoes from the rocks, or surprised by meeting them (as in the above case) nearer to camp than one could expect, when they suddenly appeared. A few years since Maine offered a bounty of $10 a head on bears, and the hunting or trapping of them was a lucrative pastime, but since the withdrawal of the premium hunters have decreased in the same proportion that bears have increased. As might be expected, around the camp fire that night the recent experience suggested hunters' tales, each having its special locality and party designated who witnessed the exploits, while the habits, courage and peculiarities of bruin and other animals were discussed to an unlimited extent.

One of the stories told by guide Morris related to a tame beaver which had grown to be a great household pet of a farmer living in the vicinity of Moosehead Lake. One night a defective faucet filled the farmer's sink and overflowed to the floor of the kitchen. Whereupon the beaver, following his natural instincts, cut up the chairs and tables of the room, and building a dam about the fugitive stream, saved the habitation from further injury.

We tarried three days at Webster Dam, where we captured the largest trout of the excursion, and feasted on many a fine duck and partridge. To impress the reader with the idea that our table fare was not so hard as might have been expected, I would state that the items of the daily menu consisted of brook trout, fried and boiled potatoes, stewed duck or partridge, hard tack, "flapjacks," with maple sugar, coffee and tea. Fish chowders and game stews were our favorite dishes, all eaten with the seasoning of a hearty appetite. At this point we were probably as deep in this wilderness as it was possible to get in the trip. The most striking feature of the forests is the absence of animal life, and more noticeable in our Northern than Southern wilds. The stately pines of the South stand from eight to twelve feet apart, and with a span of horses one can almost drive from one end of Florida to the other; in fact the writer, in the winter of 1875, met a party so equipped traveling in an open wagon from New Smyrna to Fort Capron, choosing their way by the compass aid. This open condition of things permits the rank growth of vegetation and animal life, which the close-locked branches of our Northern forests prevent. In the latter case also the continual sifting of the pine leaves on the ground, and the gloom of the overhanging boughs choke what few shrubs might have an existence. Only along the rivers, or where some woodsman has failed to spare a tree, dare anything but a courageous blackberry or shrub maple show itself. You may wander for hours in this stillness without seeing a living creature, unless you look sharply enough to mark the insects which toil in the mosses underfoot, inhabit the bark and decayed wood, or wait for you to rest before settling on you. But we occasionally entertained strangers of animal life, and in one instance that of an "angelic" order—at least it had wings, and its mission was helpful. Our Artist, while casting his line from the apron of the dam, caught it on a projecting beam, and after vain attempts to withdraw it, was successfully assisted by a little brown fly-catcher, who, swooping down, attempted to carry to its nest the bright colored artificial trout flies.

THOMAS SEDGWICK STEELE.

(To be Continued.)

GAME AND SPORT AT THE SOUTH.

I HAVE recently returned from an extended hunting trip through Virginia and North Carolina, and find that there is a growing interest throughout the South in sporting matters; or perhaps it would be better expressed by saying that the old interest is fast being revived, for in the good old times before the war, when plantations were owned generally by men of culture, wealth and leisure, much more attention was paid to field sports than could be afforded in other parts of the country. The time came when planters became farmers, and gentlemen whose hands were unaccustomed to holding the plow, and whose feet had not been trained to walk the furrow, were forced to realize the truth of the old saying—

> He that by the plow would thrive,
> Himself must either hold or drive.

For several years the rod and gun, the pack and horn had to be laid aside; game of all sorts consequently increased very rapidly. The wild turkey and the deer almost forgot their shyness and left the mountain fastnesses, being often seen where for years they had been strangers. The Virginia partridge (Bob-White) whistled from almost every fence corner, the drumming of the pheasant lured many a country boy to leave his cows and watch for a chance to try his single-barrel (old hares often added a savory odor to many a negro cabin about meal time, and but for the foxes "Mollie Cottontails" would soon have overrun the land). Often on a still night in the early fall have I listened to the foxes running and barking on the trail like fice dogs, and on one occasion I saw a fox in hot pursuit of a rabbit cross the door-yard of the house where I was staying.

As returning prosperity began to be felt in the South, and the "slough of despond" looked less deep, the old fondness for hunting soon began to reappear. As a Virginia belle, after following up good resolutions for—perhaps—a month, finds the old passion for flirting bred in the bone, and tingling through her veins with the chivalric blood of a long line of ancestors noted for generations in the chase—(after men)—so the Virginia gentleman discovers the passion for sporting. Fox-hunting has been revived, and there are now some very fine packs of hounds to be seen; but the people are as a rule too poor to often allow of one man keeping a full pack, so the dogs are frequently owned by several neighbors as a partnership pack. Much attention is also now being paid to improving the stock of bird-dogs. While in Richmond I visited several fine kennels. Mr. J. S. Wise's Tom (Geo. C. Colburn's Belle-Sensation) is a dog of remarkably fine carriage, and in every way unusually handsome. Mr. T. F. Taylor has perhaps the most complete kennel in the State—some fine Gordons—among them Champion Fan, formerly owned by the Toledo Kennel Club. In Lynchburg I visited Dr. Wm. A. Strother's kennel, where I was shown his setter Frost with an interesting family of five of the finest six weeks' old puppies I ever saw, sired by Gladstone; he also owns the image of Elcho in his dog Flint. Mr. T. F. Nelson, of the same place, owns a remarkably handsome and promising young dog of native stock, with a clear pedigree on the sire's si— 1814, including some of the most noted dogs o— sey. The mother, native Virginia stock, with estab— pedigree since 1846, is one of the best field dogs I ever hunted over.

While in Warrenton, N. C., I hunted with a number of gentlemen owning very fine dogs, mostly of native stock. Pointers seem to be most in favor in that section, and I found several very fine ones bred from Harvard Kennel Club stock. I hunted for several days with Dr. Foote, of that place—one of the most congenial gentlemen and thorough sportsmen it has even been my good fortune to meet; the owner of one of the best native pointers that ever went into the field—fast as a race-horse, staunch as a rock, hunting with admirable judgment and untiring zeal, having a pedigree of fifty years. It is noticeable that through Virginia and North Carolina, where the soil is very rough, and the ground to be hunted over is extensive, "droppers" are much used, and generally are the most serviceable dogs, having great endurance, and showing a degree of judgment almost human. It seems to be not uncommon, where their owners hunt on horseback or allow them unlimited range, for them to find coveys and return to their master, taking him to the birds. They do not understand "To-ho!" nor charge at shot; but most of them are staunch, and back-stand naturally. They watch to see a bird fall, and pounce upon it so quickly that if it is only wing-tipped, they always get it. I saw one of these dogs sit down and watch a bird that had been shot in the head rise higher and higher until it died in mid-air. It hardly touched ground before the dog had it.

On another occasion I wounded a bird that flew a long way, and began sinking gradually; one of the droppers saw it, and caught the bird in the air before it reached the ground.

All this I know is not orthodox, but still is very useful. I have seen some of the finest bred dogs in the country, who were renowned in field trials, hunted with these old rough-and-readys always to be beaten in actual work. I have myself sometimes been much chagrined at having a wing-tipped bird get into tangled grass or briars; my thoroughbred, well-broken dog pointing it from time to time in magnificent style, jumping on place after place where the bird was not, when in rushes one of the droppers, and after nosing round for a moment, takes off down a middle furrow or ditch fifty or a hundred yards, soon returning with the bird in his mouth. While your thoroughbred is systematically ranging an immense field of hill, meadow and brake, in thorough field-trial style, old rough-and-ready mounts the hill, surveys the country round, and with a knowing wink starts for the nearest "branch," following it up the wind as fast as his long legs and powerful muscles will carry him. Soon you hear a shout of "Jim's got 'em." We look around, and see rough-and-ready No. 2 pointing on the other side of the branch, with No. 3 backing him, while our thoroughbred is to be seen way up the hill backstanding by sight in beautiful style, and we proudly call attention to the fact that our dog is extremely careful and steady. I do not mean to enter criticism on any class of dogs. I neither side with the "blue bloods" nor the "natives." All I want is the dog that will do the best work and most of it. To champions of "blue bloods" I would say, I believe "blood will tell," and when I find a so-called "native" that does the most work, and gets me the most birds, he is decidedly "blue blood" for me. The blood of Napoleon or of Aaron Burr may flow in unrecognized channels, yet the elements of distinction are there, and genius and talent may at any time surprise us into recognition.

Quail hunting in the South is very hard work, the ground often being very rough and distances great; dogs of the greatest endurance are needed, and men who do not own a pair of legs that are untiring had better not try it. The birds are more gamy than those we find in the West, lying well for dogs, but making very long flights when flushed; it being generally a hilly country makes them hard to mark. Much of the cover being pine thickets growing close to the ground renders it impossible to get a shot. They often take to the trees, and after being pursued closely I have sometimes seen them exhibit wonderful adroitness in eluding their enemies. The marker often sees them light on a hill top, perhaps 300 yards from the flush, and congratulates himself on being able to go straight to them and have fine single bird shooting; when on arriving at the brow of the hill where he plainly saw them light, the dogs make game and perhaps come to a point, but no birds can be found. After lighting they ran a short distance and made a second flight to some secure branch or thicket, thus fooling both men and dogs.

Turkey hunting in many parts of the South is very fine, and to a person who does not mind lying for hours in a blind, and takes delight in matching cunning against cunning instead of testing his skill as a marksman, it may be fun; but for me, give me quail on the wing. I have hunted turkey successfully, and have "dropped a good deal of meat," but I am not enthusiastic on turkey hunting. Deer hunting seems to me much the same, though I must confess that to drop one nicely in his tracks gives a thrill of pleasurable satisfaction not often afforded by one shot at any other game, unless it is a black bear; but then it is too long between shots—a dry sport at best. While in Warrenton a pack of hounds started a deer and ran him near town, when a number of curs and mongrels joined in the chase, ran him into the suburbs and caught him, not one of the original pack being in at the death.

Of the merits of "possum" and coon hunting I have but little to say, except that it is dear to the hearts of many residents of the "Old Dominion." If you desire the pleasure, however, I will introduce you to old Uncle Ben, whose cabin by the side of the "noble Jeems" is overtowered by a spur of the Blue Ridge, and whose graveyard in the immediate rear of his cabin contains the remains of his three dear departed wives, leaving him once more alone in the world, too old to win the heart and affections of any "ob de sisters what tends de meeting," but not too old to hunt coons and "possums." He owns "de bes possum dog in de country," and on a moonlight night, armed only with an axe, will take you to the woods, where old "Bean's" voice will soon proclaim a "possum" treed. The axe comes quickly into play, and Uncle Ben's muscular arms soon fell the tree, when Bean quickly dispatches his game. When it is a coon there is more fun; then it is roll, scratch and bite, until Bean gets on top once too often, but always after a

gard to it. Old Uncle Ben also has a great talent for ... and serving up opposum so as to make it a ... an epicure.

... traveler as he passes through Virginia is surprised to find the blood-stained fields, so recently devastated by opposing armies, either in cultivation or grown up in pine forests, which would yield abundant cords to the woodman's axe. Most of the dwellings that were destroyed are replaced, and while nature and improvement have done so much to obliterate the track of war, social intercourse has done its share toward overcoming bitterness and healing wounds that political schemers would have kept open. The sportsman from the North, if a gentleman, will find a hearty welcome among many good shots and enthusiastic sportsmen. He may have the chance to realize the fact that a log cabin in the mountains often shelters people of culture and education hardly to be expected in such surroundings, and hog and hominy with a hearty hospitality is a delightful change sometimes. "Chine," "Spare-rib," "Egg-bread" and "Sally Lun," are Southern institutions not to be sneezed at, and the scoffer who cannot believe in them must indeed be one who would murder with a howitzer a whole covey of birds sheltered under a pine tree during a snow storm.

New York, Jan. 12th. BEDFORD.

Natural History.

A FROG-EATING RAIL.—Some time ago a correspondent, C. M. C., sent us for identification a bird shot at New City, N. Y. It proved to be a king rail (*Rallus longirostris*). The most curious part of the affair is, that when the bird was shot it had a small bullfrog in its throat. This is to us a new article of food for rail.

WINTER IN CONNECTICUT.—Although remarks upon the extraordinary mildness of the present winter are in everybody's mouth, we think it is not generally appreciated how extremely warm the weather is for the season of the year. It is true that the piteous scream of the ice-man rings out upon the soft, balmy air, and that from the dark fastnesses of his back shop, low, plaintive moans and muttered curses tell us that the plumber who lurks there in waiting for his unwary victims is being deprived of his natural prey; but these sounds are to be heard almost every winter during brief intervals of mild weather, and hence are no satisfactory indication of how warm it really is and has been. A better test is a series of observations on the animal life of any region, and we may mention one or two facts relative to this point which have recently come under our observation. On the 30th of December we killed, near Derby, Conn., an adult red-tailed hawk (*Buteo borealis*), which had in its stomach the fresh fragment of a garter snake (*Eutainia*). On the 10th of January we observed, near Milford, Conn., eight or ten specimens of the golden winged woodpecker (*Colaptes auratus*), a species which usually leaves these latitudes for the South in November. A few occasionally winter here, it is true, and we have ourselves observed them in the same locality before, during the months of December, January and February, but the few that stay during the cold weather are usually found alone, whereas the ones referred to here were in a flock and seemed to be as jolly and comfortable as possible. On January 12th we observed at New Haven, Conn., a flock of about a dozen yellow red-poll warblers (*Dendroeca palmarum*). This flock had been in the neighborhood for some weeks, and had attracted the attention of a gentleman interested in birds, who reported its presence to us, and gave us the locality where the birds might be found. The species usually departs for the South by the 1st of November, and its tarrying here so late in the season is a most remarkable occurrence, and only to be explained, we think, by the phenomenal weather which we are enjoying.

No doubt many of our correspondents have observed similar facts during the past month or two, and we should be glad to have them send us any notes bearing on this point which they may have collected.

THE POTATO BUG BIRD AGAIN.—*Ames, Iowa, Nov. 20th, 1879.*—In your issue of Nov. 20th, I notice a note from "W.," of Coralville, Iowa, in which he speaks of a bird which feeds upon the Colorado potato beetle. This bird is the rose-breasted grosbeak—*Goniaphea ludoviciana*, Bowditch. The first who noticed its habit of feeding upon the potato beetle was, as far as I know, Professor Bessey, of the Iowa Agricultural College, who observed it several years ago. I confirmed the observation during the past summer, and am glad to get this additional proof from Coralville. As the potato beetle is a comparatively recent comer in the State, it is of course new food for the bird which seems to be just finding out this strange and abundant supply of provision. It is to be hoped that this will prove one of those natural enemies to the insect which we have been looking for, and which will restore the balance of nature which has been so sadly disturbed in the case of the potato beetle for the past ten years. F. E. L. BEAL.

WHAT I KNOW ABOUT RATS.—*Coralville, Iowa.*—Reading in a recent issue of your paper about ducks being attracted by light, reminded me of an incident that occurred to me a few years since.

One night I went to the cellar on an errand, carrying, to light the way, a small brass hand-lamp—one that burns without a chimney. On entering the cellar I perceived some three or four rats on one end of a long hanging shelf in close proximity to a pan of milk that had been carelessly uncovered. I advanced towards them thinking to frighten them away, when to my amazement, they merely stretched their necks and with protruding eyes shining like great jet beads, stood still and gazed at the light. I still advanced, thinking that of course they would turn and run away; but they did not move. I came so close that the blaze of the lamp actually burned the long hair off their faces, and even then they did not stir. I could easily have dispatched them if I had desired; but thinking that they had been sufficiently punished for their misdemeanor, I went away and left them. I have never known of a like instance, and suppose that the rats were so busily engaged in skimming the milk that they were unconscious of my approach until the light flashed upon and bewildered them, or they would upon hearing my footsteps have retreated.

By the way, I would remark that the most successful method of trapping rats that I have ever known is to sink a steel trap in a box of corn bran, covering it lightly with the same. Set the box in any place that the rats are wont to frequent, and partly cover it—taking care to leave an opening large enough for the rats to enter. I have known of a half-dozen being caught in this way in a few hours with a single trap. W.

ANOTHER WORD FOR DR. HAYDEN.—*Webster City, Iowa., Jan. 13th—Editor Forest and Stream*—I was much pleased with the just and generous tribute of Wm. Hosea Ballou to Dr. F. V. Hayden in your excellent journal of the 8th inst., though I had previously read the eulogistic remarks of Mr. Geike, in his lately published "Outlines of Field Geology," which are therein copied. The past ten years will be noted in the history of this country as the "era of exploration." When the history of this era is written no name will stand out so conspicuously as that of Dr. Hayden. Should any of our great painters—and Bierstadt once had such a work in contemplation—ever put on canvas a picture illustrative of this period, Hayden will most unquestionably be the central figure. During all this time he did more than any and all others to acquire and popularize information concerning our wide and almost unknown public domain. In addition to his topographers and geologists, he generally had with each party in some other useful capacity—and therefore doing double work—a good newspaper man. Nearly every season scores of letters appeared from correspondents with his several parties in the New York *Tribune, Herald, Times* and *Post*, in Forney's *Press*, the Chicago *Tribune, Times* and *Inter-Ocean*, as well as in other widely circulated journals. Probably not less than one hundred columns of new and fresh reading matter were thus given to the public each year, and we all know with what eagerness it was sought by intelligent people. In many cases members of his scientific corps thus gave to the public their early impressions of the region through which they passed. Later came the regular annual reports of the survey, making known, as Geike so justly remarks, "the geography, geology, natural history, botany, meteorology, ethnology and antiquities of thousands of square miles of previously unexplored or but partially explored land." Collections were made each year by these parties in the field, which were turned over to accomplished specialists like Leidy, Cope, Lesquereax, Coues, Packard, Thomas, Newbury, and others, to be worked up and published in the great quarto volumes embodying the more permanent work of the survey. Thus Hayden's plans were at once original, comprehensive and practical. The press gave the public the earliest possible information—without expense to the Government—concerning these new regions. The annual reports, printed cheaply but in editions of tens of thousands, were sought by people in every part of the Union, as well as abroad, where Hayden was better appreciated than he ever was at home where he served his country with such rare ability. His final reports—if they are ever completed and published—will comprise a vast amount of information of the highest scientific value, sufficient to make a proud and imperishable monument to his wonderful energy and skill.

While Dr. Hayden is not without his faults, he unquestionably stands at the head of all scientific pathfinders of the great West. Other men have surpassed him in technical learning, but in energy, as an organizer and director, and in comprehensive judgment of what was due to the great public by whose money these surveys were carried on, and to the demands and expectations of science, he stands without a rival. Up to his time the results of scientific exploration rarely reached the people at all, and the official publications were postponed sometimes for a whole decade. He reversed all this—let the masses of his countrymen know early what he was doing, at the same time that he preserved all the accuracy due to science. Though he was brushed aside very unceremoniously by the last Congress, he has accomplished work which will always keep his memory bright as that of the chief actor in the era of American exploration.

CHRIS. ALDRICH.

FISH-EATING SNAKES.

THE communication of Wm. H. Ballou, Esq., November 27th, 1879, calls to the mind of the writer two incidents corroborative of the theory of that gentleman with relation to the food and habits of the water snake. In 1874 it was my privilege to join a fishing party on the Upper Champlain, near the head of Hero Island. From this islet to the main land (Vermont) there runs a long sand-bar bridge, covered with water in the spring and fall, but some ten inches above the surface of the lake in summer. To the south, and between this bar, the island and the main shore, is a tract of several thousand acres of low water and partial swamp, in which the water snakes breed in immense numbers. Northward from the bar the lake is deep, the water clear, and the fishing in May and June, for pike, bass, and perch, excellent. The days of my visit to this point were bright and warm, following several weeks of cold, damp weather, and the snakes were in high spirits and fine condition. During the first twelve hours we killed one hundred and seven of the rascals, by actual count, upon this sand-bar bridge; and at least a score of this number were shot while crossing the bar with fish in their mouths, which they had caught in the deep water, and with which they were returning to the swamp. While fishing after dark I took a handsome pike of some three pounds weight, and had just released him from my hook and placed him upon the ground at my side, when a water snake as thick as my arm and nearly six feet in length, swam swiftly out of the deep water and seized the still struggling fish with the evident intent of capturing him and carrying him away. The struggles of the finny prisoner, however, attracted my attention, and with a heavy club I managed to save my game and kill the snake.

In 1875 the writer spent some ten days upon Carleton Island, in the St. Lawrence, camping with a party of friends and enjoying the glorious air, the delightful scenery, and the fine fishing. During the time it fell to my lot one morning to prepare breakfast. I was seated at the river's edge cleaning the bass just caught, when a noise among the shingles at my side caused me to look in that direction, and to my disgust I saw a water snake perhaps four feet long, preparing to depart with the largest of my basket, a bass of nearly three pounds weight. The fish was struggling sharply, but the snake had fastened his jaws upon him, and was already in the water before I could recover from my astonishment and move. When I did, the slimy thief hastened his speed, and bearing his prize high above the water he swam rapidly out towards the centre of the river. I had lost my fish, but not my revenge; for, quickly seizing a shot gun that lay upon the ground near at hand, I fired at the retreating snake, and had the satisfaction of seeing his head drop and his body sink with many writhings beneath the pure water. My breakfast was gone, and his also. F. E. HAMILTON.

CLEVELAND, *Jan. 10th.*

The black snake (*Bascanion constrictor*) has always been a rare snake in this locality, and when found was always of enormous size; in fact the largest snake of the season. This snake is what might be called an upland reptile, never frequenting swamps, marshes, or wet grounds, but living mostly on the margin of heavy forests bordered by open or prairie lands or rocky ledges. This snake can mount the smooth, bare trunk of a five-foot oak stub as readily as the nimble squirrel, and in the thick forest can pass from tree to tree almost with the rapidity of this animal or the more agile joko on low undergrowth when pursued. I will defy any one to keep pace with him as he glides from one bush to another. His food is the callow bird, birds' eggs, and old birds in their season, rabbits, old and young, squirrels, rats and mice, and almost anything of the proper size that is alive and healthy. As a snake he has too much brain to require fish diet, and therefore I do not believe he ever goes a-fishing. The largest black snake I ever met with measured twelve feet eight inches in length, killed by a squirrel-hunter. The snake was stretched out on the uppermost limb of an ancient chestnut tree some sixty or eighty feet high. I once captured one myself that was nine feet eight inches long. Although I had a good grip on his throttle, his wiggling at times during his capture much distressed me, and has often since reminded me of the encounter (the story of which we are all familiar with) of Charles Waterton with the big boa in Demerara. Father Hennepin, in 1614, on his voyage of discovery along the Upper Mississippi, tells us that at the Falls of St. Anthony the voyagers killed a large black snake they found among the rocks that measured fourteen feet, and owing to its terrible contortions he called it the black constrictor. The black snake (*B. constrictor*) is not known among the islands at the head of Lake Erie, although snakes of many other kinds abound at this late date in several localities by the thousands during the summer months; for instance, on the south shore of Pelee, Middle, and other islands there, you will often see the black water snake (*Nerodia sipendon*) in numbers to suit your fancy, basking on the sand, rock, beaches, and flood-wood. These water snakes are expert fishermen and live almost entirely on minnows (*Alburnus vulgaris*) found along the shore. They can excel their prey in swimming and quick movements in the water. As soon as a fish is captured the snake comes to the surface, makes for the shore, and gorges the fish at his leisure. I once caught a young eight-inch water snake that had in his maw a minnow one and one-half inches long. The largest water snake I ever met with among the Lake Erie Islands measured four feet eight inches. DR. E. STERLING.

THE MANATEE, OR SEA COW.

TITUSVILLE, Fla., *Sept. 19th, 1879.*

MR. August Parks, of Titusville, Florida, is probably the only professional manatee hunter in the world, and Florida is believed to be the only State in the Union where the manatee is found and the hunting of it can be participated in.

The manatee, or sea cow (*Trichecus manatus*), is considered common by naturalists on the southern part of the Florida peninsula, on both the east and west sides. Their principal habitat, however, is the St. Lucie River, a fresh water stream which empties into the St. Lucie Sound, a part of Indian River near Gilbert's Bar, in latitude about 27 deg. 6 min. north. To this river they resort to breed and to feed on the river grass and aquatic plants, suited to them and which there abound. Among these articles of food may be mentioned the turtle-grass, which grows so abundantly throughout the whole length of Indian River in the salt water, and upon which the well known green turtles feed and fatten. In the fresh water they find lily-pads, of which they are very fond, and on the brackish marsh banks they can often reach the wild purslane (*Portulacca grandiflora*), which they like. They are strictly herbivorous, and never touch animal food. The St. Lucie River is not the only place on the east coast where these strange animals are found. Capt. C. R. Catlin, the courteous and well known river guide and boatman, of Titusville, and who was formerly U. S. Assistant Lighthouse Keeper at Jupiter lighthouse, and who knows more about the habits of these monsters than any person we have met, except perhaps Parks himself, informs me that when at Jupiter he has often seen them passing in and out of the inlet, sometimes going far out to sea, and this fact accounts for the finding of the bones of the manatee in the ocean between Florida Cape and Cuba by the U. S. Coast Survey dredging party of Prof. Agassiz some years ago. Capt. Catlin is one of the few men who have penetrated the wild and lonely fastnesses where they bring forth their young. It has been the good fortune of a few northern tourists and hunters to accompany the Captain on some of these expeditions, and it is safe to say they will never forget the trip.

The St. Lucie River is formed by the junction of the

North and South Halpahtiokee rivers, in which the solitude is as wierd and unbroken now as when De Soto first landed in Florida. Throughout the whole length of these rivers no settler's axe rings on the air to disturb the mysterious and almost preternatural stillness that broods over them.

The deer come fearlessly down to the river brink to drink, the bears and panthers hold sway in the adjoining forests, the raccoon and lynx nightly patrol the bank, the fish jump playfully in the dark waters, and the great, harmless American sea cow rears its young in safety, watched only by the solemn heron and the vigilant osprey. Few, indeed, are they who have sailed on these waters, and fewer still are the fearless hunters who have coursed these forest glades. Occasionally a shingle cutter sails his cabined boat up to the shore and cuts a load of shingles of the Florida pencil cedar. Forty years ago the hardy United States Surveyor traced his lines and set up section corners for the bears to rub against. He departed, and the wilderness has had undisputed sway ever since.

But before many years shall pass away the scene will change. Civilization is encroaching; the restless settler is every year pushing farther and farther into the unknown wilds of Florida, and even now men are casting ahead to secure a homestead or to commence a speculation in some way in the lands or products of this region. Then it will surely happen that the peace-loving manatee will be driven away and they will become but a legend or old man's tale.

Indeed the time is within the memory of those now living when the manatee was known far north of its present habitat. Old Captain Cuger, of Titusville, relates that he once shot one in Dummett's Creek, near the famous Dummett Grove, now owned by Geo. W. Schuyler, Esq., which is near the head of Indian River, and about one hundred miles north of their present northern limit.

The manatee is an amphibious, warm-blooded animal. In general it may be said to resemble the Phocæ, or seals, but unlike them is not carnivorous. It has two small flippers on the shoulder, shaped much like similar organs in the cetaceans (the whales and porpoises). The tail of the manatee is very large and powerful, and is semi-circular in terminal outline, lying horizontally in the water. It is the principal organ of locomotion, with which they can make excellent speed through the water, frequently coming to the surface to blow. They can travel much faster than two men can row a light boat, but not so fast as a porpoise can swim, being much broader, heavier, and clumsier than the latter. A full-sized manatee will weigh over a ton and will measure some fifteen feet in length by four inches in breadth. They have a very small head and very small eyes for so large an animal. Their mouth and nose resemble a cow's, and like a cow they suckle their young, the dugs of the female being situated at the breast like those of a cetacean.

The manatee hunter aims to capture the animal alive, and for this purpose quite an expensive outfit is required. It consists first, of a large seine net about one hundred yards long and six or eight feet wide, made of "spun yarn," so called, which consists of three or four rope yarns spun into one line about the size of a clothes line, and very strong. The meshes are fifteen inches wide. The head line consists of a strong rope, and floats made of wood, shaped like a double-ended boat, are placed at intervals along this to keep the top of the net near the surface of the water. The bottom is weighted with small pieces of brick, or stones, just enough to cause the net to hang perpendicularly in the water. A large sail-boat is also required. The hunter, taking the net in the boat, proceeds quietly to the part of the river frequented by the manatee and keeps a sharp look-out for the animals, which have a habit of passing up and down the river by certain points. If the look-out perceives a manatee in the river above him he knows that sooner or later the animal will take a cruise down the river, and he proceeds accordingly to stretch his net across the channel. One end of the net he first makes fast to a small bush or twig, or, if no tree is available, to a stake driven for the purpose into the bank. To this the shore end of the net is fastened by a small cord secured to the head line, and the stake or bush before mentioned, care being taken to use a cord so small that in its struggles it will be easily broken by the animal, for a reason which will appear hereafter. The boat is then rowed across the stream with the other end of the net, and when the latter is stretched to its full length, the boat is anchored and the net secured by a similar easily broken cord to the boat in such a manner that the first struggle of the animal will be felt by the occupants of the boat, being communicated by the cord to a tell-tale, or the cord is fastened to the body of one of the hunters, who now go to sleep if night has come on, or perhaps while away the time by a game of cards, keeping perfectly quiet. There are very likely several manatee in the river, and before long, one attempts to pass by the boat. His progress is of course arrested by the net, and his struggles to force a passage are at once communicated by the tell-tale cord. Unsuccessful in his first attempt to effect a passage, the manatee increases his efforts, and the result is that the slender cords holding the net to the shore and the boat are broken and the net with the manatee entangled drifts away with the current. The frantic efforts of the animal only serve to closer enwind him in the meshes of the net, which doubles and wraps itself around him closer and closer. It is now that the objects of the light sinkers and slender holding cords are apparent. The manatee is a warm-blooded animal and must come to the surface for air every few minutes. If the sinkers are too heavy, or if the net is immoveable in the water, he is unable to do this and is drowned. The large floats serve now to show the hunters the location of their prey, and they bear down upon it and tow it, with the confined animal, into shoal water. Here a large box or tank is ready. The net is unwound, ropes are placed around the animal, and by the united efforts of the hunters, he is transferred to the box. The box is then towed to the "crawl," which is an enclosure formed by driving stakes close together in the water with their tops projecting several feet above, and is generally near the home of the hunters. The box is floated into the crawl and the animal let out. He is there kept and fed daily until an opportunity occurs for shipment. This is made in the same large box, which is water-tight and about half filled with water. Such is the method employed by the Indian River hunters for catching the manatee alive. It is, however, often shot with a rifle, from the shore or a boat, when feeding or coming to the surface to breathe, but the hunter must be very quick and expert with his weapon, as they show only one-third of the head, and that only for a second.

The profits of manatee hunting are large. The skeleton, if properly cleaned, will readily bring a hundred dollars, and the skin a like sum if taken off whole, being in demand by scientists for museums all over the world. The skinning of a manatee is a laborious task, as they are generally very fat and the skin is fully an inch thick. In color they are a dirty dark brown, and the skin is sprinkled with a few hairs about an inch apart. The mouth is provided with a few long stiff hairs or whiskers. The ribs of the manatee are solid ivory. The flesh is said to be very tender and nice by those who have tasted it. They are perfectly harmless and inoffensive, allowing themselves to be handled in their tanks by any one. Their chief weapon of defense appears to be their powerful tail, with which they can strike a tremendous blow. There are many facts in regard to the manatee yet undetermined by naturalists; among them, the age to which they live, their breeding season (which is believed to be in the spring), care of their young, period of gestation, etc.

Sportsmen wishing to engage in the novel and exciting sport of their capture or shooting, or naturalists desiring to study them in their native haunts, can do so by writing to Capt. C. R. Catlin, of Titusville, who will post them as to the season and outfit, and take them in one of his staunch yachts to their haunts. Titusville is reached by two lines of steamers per week from Jacksonville, via the St. John's and Indian River R. R., and where two good hotels will be found. J. FRANCIS LEBARON, C. E.

P. S. As I write I hear that Mr. August Parks has just captured another manatee nine feet long.

Fish Culture.

FISH CULTURE AND PROTECTION IN TENNESSEE.

NASHVILLE, *Jan. 14th.*

Editor Forest and Stream:—

Since the arrival of the five hundred carp sent to this State by the United States Fish Commission, an astonishing interest has begun to manifest itself in fish culture. Col. George F. Akers, our energetic State Fish Commissioner, is daily in receipt of letters from all quarters, asking for some of the fry, and making inquiries with regard to the breeding of fishes as a science. Our Legislature at its last regular session voted down a bill which was introduced for the protection of fish in our many streams, but from the character of letters Col. Akers receives, were the same bill to be presented again, the different representatives would be forced by public opinion to adopt it. Some few counties have local protection laws prohibiting only the seines, traps and gigs; yet the increase in fish has been so great that general laws of protection would now be hailed with delight. In the Harpeth River bass are becoming once more quite abundant, and although permitting unrestrained angling in its legitimate form, in a few years ours would be as fine fishing streams as any in the United States.

Last week Col. Akers and two friends had a day on South Harpeth, and caught eleven fine bass, weighing from one to four and a half pounds. They would have taken a great many more but for the scarcity of minnows. The steel back is the bass' favorite bait, and with the few of them that the party had all the fish were caught. One of the gentlemen hooked a very large fish, which he says (of course) must have been at least a six-pounder. Large numbers of a beautiful species of perch are now being brought to our market from Reelfoot Lake. They are a beautiful dark green, with white bellies, and fins of a deep orange color. The flesh is very white and firm, and they are a delicious morsel.

A great many channel catfish are taken on set lines in the Cumberland River. They are very good for food, and are particularly esteemed by our colored population. In the part of the city where are located the cotton merchants several eating stands for the benefit of these sable citizens are found, from which these fish and steaks from the buffalo are sold. About mid-day one of these stands offers a picturesque sight that would adorn one or more pages of some of our illustrated papers. It is a pleasure to look in the face of a sleek, black darkey, whose whole countenance represents one mass of smiles and contentment, as he munches away at a pound cut of one of those fatty fish, and a huge "hunk" of corn bread in the other hand. No signs of "exodus" about him.

The carp which were placed in the pond at the Asylum are doing famously. Their growth has been astonishing. When brought here they were as small as minnows get to be, and already some of them are over two inches in length. It is a pity that our State Legislature does not pass protective laws, and appropriate a certain sum annually to the development of fish culture, and also to extend it to our game. This State could thus be made in a few years so famous as a hunting and fishing ground that the influx of visitors would pay the cost of it. Elk, Duck, Harpeth and Stone Rivers—all within easy distance of Nashville (to say nothing of the Cumberland)—offer such fields for canoeing expeditions as no other streams in the Middle States do—passing, as they do, through large sections of country where yet a virgin forest stands, in which game of all kinds, from the "Bob White" to the bear, can be found, and yet having access to the mails and telegraph at a short distance away. The introduction of the few carp has been the means of getting a pretty general expression of the people, and with a few more evidences of encouragement by the head of the department, will win over to the cause the most obdurate opposers to protection. J. D. H.

MODE OF TREATING FISH WITH FUNGUS.—*Council Bluffs, Iowa, Jan. 21st.*—The manner of treating fish with fungus referred to in FOREST AND STREAM of Jan. 8th, is as follows:—If you have small ponds (such as those used by the author), 15x30 feet, with water at outlet three feet, and at inlet two feet in depth, take a dry water bucket; in this pour seven pounds of crude salicylic acid and equal weight of soda borax. Mix the two powders well together while dry, then add a little water sufficient to make a paste; stir well, then add more water, and stir well again until you have a bucket full of liquor. Now cut off the water at the inlet of the pond; then this liquor into the pond and agitate the water with scoop or paddle. When the water has attained a brassish taste the dose is sufficient. Leave the water at inlet cut off for about fifteen or twenty minutes, unless the fish should before show signs of coming to the surface. Then let the water in the pond again. The next day follow this treatment with a heavy salting. In doing this, cut off the water as above stated, and salt the pond gradually, until it is finally quite brackish, when after about ten or fifteen minutes let the water in at the inlet. Where parties have large ponds they can apply the same treatment by constructing a small tank for that purpose, with inlet and outlet in which to place the fish during treatment. The same treatment can be used on small fish in the nurseries and hatching houses.

FISHING RESORTS.—*Attention is invited to the notice at the head of Game Bag and Gun columns.*

FISH IN MARKET—RETAIL PRICES.—Bass, 25c.; smelts, 8 to 13c.; smelts, green, 15c.; bluefish, 12½c.; salmon, frozen, 35c.; mackerel, large, 25c.; shad, Southern, each 50c.; green turtle, 15c.; terrapin, $12 to $30 per dozen; frost fish, 6c.; halibut, 18c.; haddock, 8c.; codfish, heads off, 7c.; heads on, 6c.; blackfish, large, 15c.; flounders, large, 10c.; sea bass, 18c.; eels, large, dressed, 18c.; lobsters, live, 10c.; boiled, 12c.; scollops, per gallon, $1.50; soft clams, per 100, 30 to 75c.; large, 60c.; whitefish, 18c.; pickerel, 15c.; salmon trout, 18c.; black bass, 18c.; hard crabs, per dozen, 40c.; soft crabs, per dozen, $1; red snappers, 15c.; sheepshead, 25c.; terrapin, prawns, per gal., $1; smoked haddock, 10c.; smoked salmon, 18c.; dry cod, 8c.

—We saw the other day at the well known restaurant of John Sutherland, in Liberty street, this city, a handsome bit of high art in fish. It was a magnificent red snapper which had been frozen in the center of a large cake of clear artificial ice, and so forwarded in state from Florida direct to Mr. Sutherland's counter. The fish was viewed by hundreds of interested epicures; and finally, when the ice melted, they served him up hot.

OREGON.—*Corvallis, Dec. 28th.*—Our trout fishing here in September cannot be excelled, I think, elsewhere in the United States. W. B.

FINE BLACK BASS FISHING.—*Fulton, N. Y. Jan. 19th.*—I am always glad to entertain and show strangers where to go, and love to go with them. Our fishing facilities are easy to get to and cheap. You do not have to go roaming over mountains, through brush and brier, but good clean banks and beautiful rapids, falls and dams for twenty-five miles, and you can wade the rapids below any of the falls or dams. In this twenty-five miles there is the finest bass fishing in the world. There are seven dams and two beautiful falls. These are all on the Oswego River, which is the outlet for the following bodies of water:—Owasco, Canandaigua, Cayuga, Cazenovia, Seneca, Onondaga and Oneida Lakes, which, flowing through the Oneida and Seneca Rivers, form the Oswego, making it one of the finest fishing points in the world. For fly-fishing, still-fishing, or trolling, there are beautiful wood-lands along the banks of the river suitable for parties wishing to camp out. There are also beautiful towns or villages every four or five miles, making it convenient for parties to get good accommodations; first comes New Bridge, then Phœnix, Lock No. 1, Oswego Falls, Fulton, Minetto, Seneca Hill and Oswego City, with good hotels at all these places. We fish for black bass and glass-eyed pike from the first of June until the last of September. July, August and September are the best months.

F. J. VAN VALKENBURG.

TROUT STREAMS IN MONTANA.—*Fort Custer, Montana Ter., Jan. 2d.*—I read, in your issue of Dec. 11th, an article entitled "The Trout of the Past." I suppose the days of the trout are not so good in the States as they were in the days of yore; but while hunting through different parts of Montana I have found mountain trout by the thousands. I give a few localities for the benefit of any who may wish to come to our land of game and fish. Tongue River is formed by three mountain streams known as Goose Creek, North Middle, and South. I spent five days hunting and fishing on the middle stream, and I never caught so many trout in the same length of time in my life. They would take the hook when held full six inches above the water. We used a small green grasshopper as the bait. The first evening we struck camp about one hour by the sun. Four in our party killed two black-tailed deer and caught 137 trout. We then came to the head waters of the Little Horn River where we found an abundance of trout. From there we traveled north along the Big Horn Range. We found trout by the thousands in Rotten Grass, Soap Creek, Black Cañon, Pryor's Fork, Clark's Fork of the Yellowstone River. The Yellowstone has trout enough to keep a regiment of anglers for the next century. Above the first cañon up to the National Park, Henry's Lake and the Yellowstone Lake abound in trout; and the traveller who visits this Park and says he does not get the worth of his money need look no farther. He may also see here the large geysers that throw a large volume of water over 150 feet high every sixty minutes, and boiling springs and cold springs, the Devil's Paint Pot, Specimen Mountain, Sulphur Mountain and a thousand other wonders. Twenty-five-yard Creek, which heads in the Crazy Mountains, also abounds in trout. I never have been north of the Crazy Mountains and cannot speak in re

gard to that country; but the streams mentioned I know to be alive with the speckled beauties. Also there are here buffalo, bear, elk, deer, mountain sheep, antelope, geese, ducks, grouse and sage-hens in countless thousands. The sportsman who comes to this country will receive a welcome by all true brother sportsmen and will find game, large and small, to his entire satisfaction.

WM. A. ALLEN.

TROUTING AMONG THE COAST RANGE MOUNTAINS.

ASTORIA, Oregon, *Dec.*, 1879.

At ten o'clock of a bright starry night in June I stepped aboard my skiff and the trip began. My baggage consisted of a well-filled lunch basket, a pair of blankets, elastic top rubber boots reaching to the hips—for our streams must be waded—fishing tackle, including a bait box filled with salmon roe cut to the size of white beans, it being too early in the season to depend upon flies, and last, my little Wesson rifle, without which—an invariable rule—I never step aboard a boat. The fishing ground was to be the upper waters of Young's River, distant fifteen miles, where at Casey's, just below the falls, I was to join two friends who had started that morning in a sailboat. I had told them at their departure that they could depend on my arriving sometime during the night, probably between 1 and 2 o'clock. The route was down the Columbia, close to the Oregon shore for a mile and a half to Smith's Point, around the Point into Young's Bay, at the head of which, two miles inland, was the mouth of Young's River. With the water smooth on its surface and the tide at half flood, but with a long heavy swell coming in from the bar, the point was reached in three-quarters of an hour, when just as I was turning the boat to run into the bay, a heavy swell subsiding left me aground upon a large rock of whose existence I was aware, but which I had expected would be well covered at that stage of the tide. I kept my seat with oars ready for a stroke, hoping the next swell would lift me off, but as that and two or three more failed to do it, I stepped out on the rock and pushed her into the water, but before I got aboard a large wave came wetting me to the waist and nearly tearing the boat from my grasp; but I held on, and in a minute I was back in the boat, all right, except for the wetting. A few more strokes carried me into the bay, when, with the swell astern and the tide making fast, I soon reached the mouth of Young's River. A half mile in an easterly direction, then an abrupt turn to the south, and the course was straight ahead ten miles to the forks of the Klaskanine. At midnight I had made somewhat more than half that distance, when I ran into a bank of fog so thick I could not see a half dozen yards in any direction. I tried to keep on by following the eastern shore, but after a few minutes found I had run into one of the numerous tide-land sloughs which make out from the river, and being satisfied that it would be useless to proceed until the fog disappeared, I made fast the painter to a bunch of tulies, wrapped the blankets around me, and with my creel for a pillow lay down to wait for morning, with no sound to disturb my slumbers except the occasional mournful cry of the blue heron and the distant booming of the breakers on the bar.

Waking at 4 o'clock the light was found sufficient to continue the journey, and though the fog was still thick I succeeded in following the shore, keeping a boat's length from the bank until at half-past five, it being now daylight, the fork of the Klaskanine was reached. Here the river divides into two streams of about equal size, the left-hand fork, the Klaskanine, coming from the East, with Kamm's landing, the head of tide water, a mile distant. The right fork, which keeps the name of Young's River, comes from the southwest, and after a mile and a half more I stepped ashore at Casey's landing, having found just sufficient water on the "cut-off," a narrow passage of twenty yards long, to save a mile in distance.

A walk of two hundred yards through a meadow covered with a luxuriant growth of timothy and white clover, brought me to the house where I found the "boys" had just turned out and were getting their tackle ready for business while waiting for an early breakfast. That important duty having been duly attended to and each having placed a lunch in his pocket, we shouldered our twenty-pound creels, took up our rods, Alex's a Leonard, Sibson's a twelve-ounce English lancewood, mine an eight-ounce Conroy, Bissett & Malleson, and started up the trail. Our plan was to do no fishing until we reached Tucker's clearing, five miles above the falls; then to scatter along the stream and fish down. It was 7 o'clock when we started; the sun had dissipated the fog and everything gave promise of a lovely day. We anticipated fine sport, for in this country the trout bite best when the sun shines bright, and if it is just a little warm so much the better. After a few minutes' walk the trail ascends a hill one hundred feet high, then runs along a narrow ledge on the side of the mountain, from which you look down on the river rushing through its rocky gorge and plunging down into a dark pool below. The fall is about sixty feet and is not entire, being broken half way down by a projecting ledge, from which it falls in a shower of sparkling spray. The trail continues along the west side of the stream for nearly half a mile, then crosses on an immense spruce log twenty feet above the water. From this point for two miles the hills rise abruptly from the waters' edge to a height of four or five hundred feet, their sides covered with a growth of evergreens of which no one who has not been in Oregon can form a conception. I know of many spruces from which boards could be made—if only mills could be found to saw them—without a knot or curl, ten feet wide at the butt, eight feet at the top, and a hundred and fifty feet long. There is a spruce trunk now lying on the ground at Nappa, from which twenty cords of limbs were cut, measured, and sold. Spruce lumber is used here for the same purpose that white pine is in the East; it works a little harder, but is as smooth and fine in texture as satin. There are two kinds of fir—the red and white—not so fine in texture as the spruce, but equally valuable, rivaling the oak in strength and durability.

The red fir is used for ship-building. Among the lesser growths the salmon berry is conspicuous, being found everywhere through the forest. It is simply an immense raspberry, growing ten and twelve feet high. Its blossoms appear in the middle of April, the time of the arrival of the earliest run of salmon, whence its name, and are like a beautiful, diminutive wild rose. Two miles from the falls the hills recede, and a small tract of comparatively level land is reached. Here there is a small house and a few acres of cleared land, owned by a settler of the suggestive name of Toothacher. This, so far as I know, is the highest point ever reached by a fishing party, and had we wished we could easily have secured all the fish we wanted by beginning at this place. But we wished to know what the river had to offer in the way of pools and riffles between here and the upper clearing; so we continued our tramp along the mountain trail, until at 9 o'clock, after what seemed to us the longest five miles we ever knew, a sudden turn brought us in sight of the end of our journey in this direction.

Having reached our destination, we lost no time in getting down to business. Aleck and Sibson started down the stream together, while I went up a few hundred yards to investigate its condition at the point where it entered the clearing. I found a place that suited me, and throwing my line beyond where a long riffle was losing itself in a pool overhung by alders, I drew the coachman and gray drake that formed my cast, diagonally across the stream. Getting no response, a yellow hackle was put in the coachman's place and the trial repeated. The hackle had scarcely touched the water when there was a commotion all around it, and by the singing of the reel and the bending of the rod, I knew I had hooked one, and a good one, too. His first attempt was to reach a pile of driftwood that had collected at the lower end of the pool, so I had to snub him smartly, which he resented by leaping out of the water a half a dozen times in quick succession, then, his strength beginning to fail, I drew him, not without an occasional protest, to the grassy shore and laid him gently beside my creel. Applying the butt of my rod, he was found to measure thirteen inches, and his weight by my pocket scale was a pound and three ounces. He proved to be the best fish caught that day. I now removed the gray drake, and a scarlet ibis with wings neatly cut away was put in its place, and casting, I had the satisfaction of drawing two at the first attempt; a half a pound to the ibis and five ounces to the yellow. Continuing, I took from this pool twenty trout, the rest weighing from four to six ounces. Placing a handful of fresh grass in the bottom of my creel, I laid the trout upon it, the large one at the top. I then started down stream, and when passing the house, Tucker's boy, a bright lad of a dozen years, came out and asked if I had come from Astoria. I told him I had, and he remarked that I must want the fish pretty bad to come so far for them. I told him that I did; that in fact I could not possibly get along without them. He then inquired: "What bait do you use—salmon eggs?" I replied by showing him my flies. "No," said he, "you can't fool me; trout don't eat feathers." I showed him my catch, and asked him if he could take as large ones with salmon eggs as I had with "feathers." After examining the large one, he said he thought not; though he had caught some nearly as large. He told me the fishing was much better for a mile above his home than it was below. This I found to be true, as for nearly three miles the stream flows along the edge of an extensive tract of bottom land, its bed in most places too sandy and its current too slow to suit the active nature of the "mountain trout." I also found that I could not do so well with flies as I had at the beginning, and often after trying in vain at some dark pool or rapid riffle, I would attach a bit of bait to the leader, and be rewarded by a fine fish the instant the flies touched the water.

Once in wading through a shallow pool, whose bed of yellow sand allowed every object to be seen with perfect distinctness, I made a hurried cast, and not expecting a rise drew the flies quickly from the water. As I lifted them out a beautiful ten-inch trout made a rush for them, stopping within a foot of my knee, where they had disappeared, with every fin quivering with excitement. Standing motionless as the alders on the bank, by a slight wrist movement I lowered the flies to the water immediately above him. As they came within his view he made a grand leap past the hackle and caught the ibis a good six inches from the water, taking it, too, by a good, honest bite without the suspicion of an attempt to "flop it into his mouth with his tail." It was past 1 o'clock when I sat down to eat my lunch on a log that formed part of a pile of driftwood. On the sandy shore, besides the tracks of my companions, there were a few of deer and bear and many of coon and beaver, and around the log on which I was sitting were many sticks of alder and maples cut to lengths of two or three feet and neatly stripped of their bark, showing that here a beaver had taken his lunch as I was taking mine. As my creel was getting heavy, I now fished only in the most attractive places and hurried on to overtake my companions, and soon turning a sharp bend I saw a large rocky pool which I recognized as the "big basin," the highest point reached on previous trips. Here the character of the stream undergoes a change—the hills come together, its course is obstructed by immense boulders, the descent is rapid, and it is the best-stocked stream and the hardest one to fish in of any within my knowledge. Hurrying on, a quarter of a mile brought me to Toothacher's, where in the shade of a spreading hemlock my friends, with well-filled creels, were waiting my arrival. After a half hour's rest we took the trail for the landing, which we reached at 5 o'clock. Placing our traps aboard, Aleck and Sibson in the boat, her mast lowered, and with two pairs of oars; I in my skiff. Having two hours left of the ebb we made Smith Point just in season to catch the flood, and in three hours from the falls we landed at Astoria, and I know one of the party was the wetest, tiredest, and most hungry man that ever stepped out of a boat.

BOSTON.

—A Norwich, Conn., bulldog took hold of a Newfoundland dog, and the latter deliberately dragged his antagonist into the water after him and held him under until, nearly drowned, he let go.

—At the performance of "Jesse Vere" in a London theatre, where a mother has a terrific combat with two ruffians for the possession of her child, a large Newfoundland dog that had got into the pit along with his owner, a steamship engineer, leaped over the orchestra and, landing on the stage, seized one of the fellows, and was with great difficulty removed. He had been a companion of children.

The Kennel.

—We learn that Mr. Godeffroy, the owner of the Neversink Farm Kennels, Guymard, in Orange County, New York, has secured Philip Thurtle, the breaker of Mr. Macdona's famous field trial setter dog Plunket, to act for him in the capacity of gamekeeper, dog-breaker, and kennel man. We have little doubt that with such a hand from the old country the Neversink kennels will make their mark at future field trials.

MR. A. H. MOORE'S KENNEL.—Mr. Moore writes us that he has already commenced rebuilding the section of his kennel injured by fire, and that within three weeks it will be in shape again.

ST. LOUIS KENNEL CLUB'S JESSAMINE.—We noticed last week the arrival of this fine imported pointer bitch, Jessamine was whelped in the spring of 1876, by Lord Downe's Mars out of Lord Sefton's Jilt; Mars by Garth's champion Drake out of Garth's Mite; Jilt by Lord Sefton's Mat out of Lord Sefton's Peg, etc. Mr. Pilkington writes that Jessamine was the pick of Lord Sefton's kennel; she is litter sister to Mr. Pilkington's Jilt, V. H. C., at the late Birmingham show; she is in whelp to Mr. Pilkington's Garnet and is due to whelp on the 27th of the present month.

THE DOGS OF GREAT BRITAIN.—In the last financial year there were in Great Britain, 111,870 dogs licensed at 5s., and 1,051,512 at 7s. and 6d., a total of 1,163,372 dogs. The tax is payable on the 1st of January, no matter when the license was obtained.

BEAR DOGS.—A correspondent living at Clifton Forge, Va., writes us that Mr. Arch. Tolley, who lives in the Blue Ridge Mountains, and has killed more bears than any other hunter in that vicinity, prefers the common fox-hound, crossed with about one-fourth shepherd. These dogs will nip the bear from behind and hold the bear until the hunter can come up; or, if the bear is a young one, they will always force it to "tree."

MR. GARRET ROACH'S KENNEL.—One of the choice kennels in the vicinity of New York is that of Mr. Garret Roach, at College Point, L. I. Mr. Roach has now on hand over twenty fine bred pointers and setters, noticeably Lady Gordon, the black and tan setter, winner of first prize at St. Louis in 1878; second prize at same place and year in the open class; first prize at New York last year; first prize at Philadelphia in 1879, and also winner of the special silver tankard prize in same city. The well known pointer bitch Queen II. is also of this kennel. It will be remembered she took first prize in the puppy class at New York in 1877. Another first prize dog is the fine young black and tan setter bitch Nancy Lee, winner in the puppy class at New York last year. We frequently hear of large litters, but it is seldom that two occur in one kennel within a few months of each other. This happened to the above two first named bitches; Lady Gordon, on June 2d, 1879, whelped seventeen puppies, eleven dogs and six bitches, by Don Juan. All the puppies were remarkably healthy. On Sept. 21st, 1879, Queen II. whelped thirteen puppies (liver and white), nine dogs and four bitches, by Champion Sensation, all fine, healthy and full of life. All these dogs are too well known to be further particularized.

THE COOPTOWN KENNEL CLUB.—Extracted from the unpublished adventures of John Doe and Richard Roe—sportsmen:—

"But great was the excitement when our two friends started the Cooptown Kennel Club and incarcerated in the old barn the germs of hope and promise. The village was on the tip-toe of wonder and delight, which transports, however, after two sleepless nights, were somewhat modified. A town meeting was held at the store, the kennel voted a nuisance by universal consent, and its two founders summoned before the Squire to show cause why the diabolical barks and howls should not cease. In due course the two martyrs to successful propagation put in an appearance, but as both gentlemen had lost their voices 'a holleren o' nights,' they were unable to communicate with the powers that were. The upshot was, the Squire at last said in his most dignified tone:—'I aint much for staying awake of nights, and the fiat has gone forth; the consarned kinnel must stop, or that there pack of hounds made to jist shut up.'

"As necessity compels invention, so it was that Richard Roe came to the fore and averted the devestation that threatened to end 'those good times in the future,' which are always treasured up at so great a premium, and which, it is a thousand to one, are never realized."

"It was indeed Dick, who first applied clock-work to the phonograph, in the shape of a 'cussing' attachment for kennel use. After the machine had been interviewed, and the attachment returned from a visit to the railway station, where it had been sent to hear folks miss trains, it was beautiful to hear the thing work when hung up for the night in the barn. Every ten minutes, out would come: 'By thunder! wat er 'bout?'—'You, Sir Percy, jist shet up!'—'Toe-foe, down ch-e-a-rge!'—'Git! now git!'—'To your bed, Clarine!'—'You Fide! dry up!'—'Shet yer month, the whole lot on yer!'—'Here Watch, sickum Watch!'—Wat er 'bout?' etc."

"The thing was a success, and Cooptown dreamed once more how it would have a walk over next bench show 'down to New York.' John Doe braced up, and Richard was himself again."

DOGS POISONED BY SALMON.—We publish further notes from our Corvallis, Oregon, correspondent, whose dogs were poisoned by eating the salmon of those waters. We have never seen any satisfactory explanation of this trouble. The writer's statement that the malady is induced by eating the fresh and healthy salmon precludes the opinion formerly expressed that this may have been a case of poisoning by decayed fish. We should be pleased to have statements of any other and similar cases which may have been noted. We are inclined to class this among other phenomena of fish poisoning (some of which we refer to elsewhere), the causes of which are little understood even by students who have devoted much study to the subject:—

I think my former communication was not as complete as it should have been, as you evidently understood from it that our dogs are only injured by eating the dead or putrid salmon, whereas the facts are that a piece of the cleanest and best salmon, even when ready for the table, will produce the same effect described in my former letter, if any dog not previously inured to eating it gets hold of it. It is considered here phosphoric poisoning, as after the salmon is cooked dogs may eat it with no ill results. Our doctors here have considered the case frequently, and various remedies have been the result, but none thus far have proved satisfactory. It is also claimed that our brook trout and salmon trout will produce the some effects, although I have never seen a case produced this way myself. I trust the publication of my first letter may call out some opinions from some of your readers that will throw more light on the subject.

DISTEMPER AND ITS EFFECTS.

DELAWARE CITY, *Jan. 19th.*

ANOTHER feature in administering medicines to dogs which is of vital importance to remember is, that in giving such remedies as digitalis, strychnine, etc., etc., their curative effects are best attained by small and often repeated doses gradually increased, and if after the dose has been increased several doses are omitted and then renewed in the same dose, it may prove fatal, as by gradually increasing the dose such doses as would otherwise be poisonous can be borne with impunity, and if given after suspension, the effect on the system being lost, the action is the same as though there had been no gradual increase. There are several means of detecting the approach of death in distemper. A positive sign is the flight of fleas and all vermin. This often occurs long before the extremities commence to get cold. Another is the falling off of the coat, which is sometimes so complete as to leave the dog almost naked. This falling off of the hair is caused by suspension of the secretions necessary to the life of the hair; the temperature of the body is indicated by the thermometer. The temperature is also ascertained, though not with the same degree of certainty, by feeling the tongue and gums. Vaccination has been proposed as a preventive of distemper, and even lauded by a few as a specific, but I assure you there is not a shadow of truth in its usefulness, and I now often condemn myself for ever entertaining the hope for a moment, as there is not the slightest similarity to small-pox. Our main dependence in following the condition of the lungs in distemper is the crepitant rale; its greater or less destruction indicates the severity of the disease, and as time passes if the rale is superceded by the normal sounds of respiration we may conclude that the inflammation has subsided, which is joyful news, for when the inflammation subsides in the lungs you may take it for granted that it has already subsided in the other parts of the system, and all that is now to be treated is the prostration and fear of relapse. But we must be positive that it is the respiratory sounds that we hear, and not the sound of solidified tissue. Distemper, when complicated by inflammation of the lungs, is always accompanied with fœtid breath, which is also an indication of the severity of the lung trouble, which subsides when the inflammation is superceded by a healthy condition of the lungs. If the inflammation is superceded, solidification, or what is called hepatization of the lungs, the fœtor is still there. In its after effects distemper in the dog is like scarlet fever and measles in children, it often leaves the patient with some effect of its course, the worst of which is epilepsy and chorea. Sore eyes, with defective sight and loss of scenting powers, are also frequent. Epilepsy and chorea are seldom cured after they have become thoroughly established. When the first symptoms appear preventative measures may be taken. No. 7 (or *Nux lg. Aur.*) given three to six times during the twenty-four hours is the treatment for either. After they have become established this treatment will give relief, but will not cure. Seatons in the back of the neck are recommended, but for what reason I cannot say, as I have tried it in over fifty cases without the least good effect. Neither will nitrate of silver or the other prescribed drugs answer any better. He must be an exceptionably good dog indeed which I would care to keep after he had become an epileptic; but I have seen many serviceable dogs, several of which had chorea so severely that they could scarcely stand; yet it is enough to give one the horrors to see a dog jerking and snatching as though he were in the greatest misery. I am of the opinion that this disease is not painful—only annoying. I once owned a bitch which would kick and jerk so badly while sleeping that she would move several feet from her first position without waking. This bitch could stand as many hard days' hunting as any other man's dog. I also once had a bitch in training for a gentleman, who would often fall flat when at full gallop, but she would get up and go it again, not seeming to be fatigued. This bitch was by Rock (Adams) out of Queen Mab (Burges), was very promising and had the handsomest head I ever saw, not excepting Rock. Chorea from distemper will vary from the cases described to a slight twitching of the limbs, or even lesser muscles, very frequently, of the jaw. Epilepsy, though far the worst of the two, often does not appear so until he is warmed up by exercise; not the slightest symptom of the disease is apparent when he is inactive. When a fit is coming on the dog appears bewildered, and stands looking around, as if to locate himself; at other times he goes off without a moment's warning. He will start around in a circle leaning inward and acting much as though he was lame in both outside legs. After he has described part of a circle he falls over on his side, kicks vigorously, froths at the mouth, his eyes turn over in the sockets and he recognizes no one. You must now approach him carefully, so as not to scare him or allow him to bite you, which he will be apt to do if you are not on your guard. He will not run at you to bite you; only when you lay hands on him he will snap at you. Secure him in some way or he will run until he is exhausted, all the while excited and nervous. These cases are nearly all supposed to be rabid and likely to be killed before they recover sufficiently to go home; but if you prevent his starting, talking to him kindly, and if you have anything eatable about you give him some, he will soon be himself again, and in most subjects this is the only attack for that day, and he will do a good day's work. Others remain weak and exhausted and must have a long rest and sleep before they gain sufficient strength to follow you. This dog is useless for hunting purposes. Every time he is warmed up by exercise the scene is repeated. Distemper, worms and mange, formerly considered the three worst enemies of the dog, have by careful study and experiments been rendered comparatively harmless. M. VON CULIN.

FOX-HUNTING IN CHESTER COUNTY.

WEST CHESTER, Pa., *Jan. 17th.*

FOX-HUNTING is now in the zenith of its glory, and the Chester Valley and the Brandywine Hills, as well as those adjacent to West Chester, resound to the music of the hounds. The admirers of this exhilarating sport in our borough have formed themselves into an association styled the West Chester Fox-Hunting Club, of which Evan Rogers is President; Harry J. Brenton, Secretary, and Jeff. Shaner, Master of Hounds. An imposing uniform of dark blue coat and cap, corduroy breeches and high-topped boots, has been adopted. The organization is composed of men who would not patronize a pastime deteriorating in its moral influences; the roll of membership exhibiting such names as Senator James B. Everhart, author of the famous poem entitled "The Fox Chase;" George A. Mercer, our efficient Postmaster; Pierce Hoopes, Jr., Clerk of the Courts; J. Gheen Morgan, B. Tevis Hoopes, and a host of others. The kennel is the best in the State, and numbers about sixty well-trained animals.

The grand event of the season has come and gone. Never in the annals of fox-hunting were greater preparations made for its thorough enjoyment, and for weeks previous to the forthcoming two-days' hunt it was the theme of conversation whenever two or more enthusiasts chanced to meet. Wednesday and Thursday, Jan. 14th and 15th, had been set apart for the annual chase. An invitation having been extended to the Rose Tree Club, of Media, Delaware County, to participate, a score of visitors reached the borough Tuesday evening, fully uniformed, bringing with them their horses and dogs. A sumptuous repast was spread before them, after partaking of which all retired to woo "Nature's sweet restorer"—sleep. Early on Wednesday morning they sallied forth. The West Chester Club turned out in full force, and as the party rode through the streets, "the red coats and the blue," a novel and picturesque scene was presented. Among the hills of East Goshen the dogs first gave tongue. Reynard made his appearance, and after scanning his pursuers for a moment, concluded to find a safe refuge, which he did after a short run of about a mile. He took to earth, leaving our huntsmen to seek other conquests.

Three of these wily creatures were started, but afforded but little amusement. Thinking "discretion the better part of valor," they immediately sought their holes, and were seen no more. A number of mishaps occurred among the horsemen in taking the fences, but with the exception of a few scratches no serious damages were sustained. Toward noon they returned to West Chester, well pleased, and ready for whatever the morrow might bring forth. The snow which had fallen a few days previous materially interfered with the run of Wednesday, and it was feared it would prove a barrier to Thursday's sport. However, at 7 o'clock A. M. the dogs were again turned loose. Nothing of an exciting nature transpired until Pambers' Woods were reached—to the south of West Chester about three miles—when the terrific tongueing of the animals gave notice that the fun had begun. Out of the woods sprang the fox, closely followed by a hundred hounds. The excitement was intense; the horses needed no spurring; they had caught the fever, and with raised heads and distended nostrils were as eager to push forward as their riders. What a glorious sight! Yonder they go over the hills towards the Brandywine, all eager to be in at the death. His foxship had prepared himself for a day's run, and after reaching the Brandywine followed its course, never once deviating. On through Chadd's Ford, to the Twin Bridges, thence in the direction of Dupont's powder works, he kept the lead, seemingly defying the hounds to catch him. When within a few miles of Wilmington he slipped into a hole, and with his disappearance the two days' hunt came to an end. The weary hunters returned home brimful of satisfaction over the glories of the chase. From the starting point to the final close the distance in this day's run was almost or quite fifteen miles. ANON.

SHOOTING DOGS.—*Canal Fulton, O., Jan. 12th.*—In your last issue I saw an article on "Breaking Dogs with Cold Lead." Last fall I was hunting ducks and snipe along our river with a young setter of my breeding that had not been trained much. He was very anxious to catch every bird he saw or scented; and I believe he would have made a good dog if I had not unfortunately tried to break him with lead. I saw some ducks in the river, and the dog saw some killdeer which he chased. I became provoked and thought I would try stinging him with shot. I did not stop to think that I had a load of No. 6 shot and 3½ drachms powder, but let drive at him about one hundred yards away while on the run. The dog came to me looking very sick. I looked to see where he was hurt, but he never moved again from the spot where I stood. He had been running with his side to me, and I think the shot entered his vitals. I will never try breaking dogs again with lead. G. H.

The shot evidently penetrated the heart of the dog and caused almost instant death. This is not remarkable, for when a dog's fore leg is stretched forward it exposes a very vulnerable portion of his body. It is only several years ago that a very large bear was killed near Fort Laramie, by a few pellets of very small shot, the gun being in the hands of an inexperienced person who was not aware of the danger he ran in firing it.

POINTERS AS FIELD DOGS.—*Hamilton, Ont., Jan. 17th.*—I would infer from your recent reports of field trials that pointers were ignored in field trials on this side of the Atlantic. Your humble servant being one of those strong in the belief that pointers can more than hold their own with setters in the field, the following important points in which first-class pointers will excel compared with setters may be of interest to some of your subscribers.

Pointers are less difficult to train than setters and retain their training for a greater length of time. As a rule their powers of scent are more acute, and they will stand more fatigue in hot weather and where water is scarce. I have seen pointers that were the most perfect retrievers and whose scenting powers were so perfect that in retrieving they could distinguish a dead or wounded bird from one uninjured.

Some thirty-five years ago, in one of the best counties of England for shooting and where the best pointer bitch in England to-day was bred, viz., the one that beat the celebrated setter bitch Countess, in a field trial, setters were the exception, and the strong staunch pointer of the Spanish type was the rule.

I remember being with my father partridge shooting over a brace of pointers in a field of turnips, when Rake came to a point, Dan being some distance away backing in fine style, the birds were flushed and a brace shot. After loading, Rake was ordered to seek dead; he retrieved one of the birds when Don came to a point, Rake barking Don's pointing with the dead bird in his mouth. It was one of the finest sights I ever saw or ever expect to see. The pointer of the present, like the foxhound, has had his usefulness impaired for the sake of speed at the expense of more useful qualities. RANGER.

There will be more attention paid in the future to pointers as field trial dogs, and it will not be long before we shall see them come to the fore and hold their own, as they are known to do in a hard day's work.

THE FIRST PACK OF FOX-HOUNDS.—The first real steady pack of fox-hounds established in the western part of England was by Thomas Fownes, Esq., of Stepleton, in Dorsetshire, about 1730. They were as handsome and fully as complete in every respect as any of the most celebrated packs of the present day. The owner was obliged to dispose of them, and they were sold to Mr. Bowes, of Yorkshire, at an immense price. They were taken into Yorkshire by their own attendants, and after having been viewed and much admired in their kennel, a day was fixed for making trial of them in the field, to meet at a famous hare-cover near by. When the huntsman came with his hounds in the morning he discovered a great number of sportsmen, who were riding in the cover and whipping the furzes as for a hare; he therefore halted and informed Mr. Bowes that he was unwilling to throw off his hounds until the gentlemen had retired and ceased the slapping of whips, to which his hounds were not accustomed, and he would engage to find a fox in a few minutes if there was one there. The sportsmen having obeyed the orders given by Mr. Bowes, the huntsman, taking the wind of the cover, threw off his hounds, which immediately began to feather and soon got upon a drag into the cover and up to the fox's kennel, which went off close before them, and after a severe burst over a fine country was killed, to the great satisfaction of the whole party. They then returned to the same cover, not one half of it having been drawn, and very soon found a second fox exactly in the same manner as before, which broke cover immediately over the same fine country; but the chase was much longer, and in the course of it the fox made its way to a nobleman's park. It had been customary to stop hounds before they could enter it, but the best-mounted sportsmen attempted to stay the Dorsetshire hounds in vain. The dogs topped the highest fence, dashed through herds of deer and a number of hares, without taking the least notice of them, and ran in to their fox and killed him some miles beyond the park.

Before this pack was raised in Dorsetshire the hounds that hunted Cranbourn Chase hunted all the animals promiscuously, except the deer, from which they were necessarily kept steady; otherwise they would not have been suffered to hunt in the chase at all.

DON AND THE NEWSPAPER.—This story of a knowing dog is told by the Bodie, Nevada, *Standard*:—

Lance Nightingill's Don was worth two such Yankee dogs. All old Carsonites remember Don—a setter of the purest blood, with his nose split to his teeth. When Lance was State Controller of Nevada, his office was next door to the *Appeal*, then conducted by Harry Mighels. One of Don's daily duties was to make an ante-breakfast call at his master's office and bring him the Sacramento *Union*—at that time the first source of telegraphic news. One morning in the spring of '67 Don turned up without the paper. Lance reproved him and ordered him back to the paper. Lance reproved him and ordered him back to perform his duty. Off went Don, but soon the poor fellow returned, his ears drooping, his tail between his legs, and his eyes expressing such abject misery as only a faithful dog can suffer. Again came the rebuke from the master. For a moment poor Don cowered; then, suddenly he pricked up his ears, wagged his tail—the light of an idea shone from his face, and off he galloped. And in three minutes he returned triumphant with the *Union* in three minutes he returned triumphant with the *Union* in his honest jaws. He had gone next door and stolen in his honest jaws. He had gone next door and stolen in Harry Mighels' paper. Lance has long since gone to his long home, and the mould lies deep over the remains of his faithful friend and servant, Don. Loving hands have conveyed to its last resting place the dust of the Harry Mighels we all loved so well; but we have thought it well to rescue from the oblivion of death the honest theft of poor old Don.

ing entries for the English Field Trial Derby closed on August 1st. The stake has been considerably increased in value, and good chances are offered for both setters and pointers. The National Field Trial Society have also thrown out strong inducements to encourage the bringing out of good puppies, as they have withdrawn from their programme the two All-aged Stakes, and give two good stakes, and a Brace stake.

BRED.—*Lassie-Roy*—Dr. J. W. Downey's imported rough-haired collie Lassie to imported Roy, winner of first prize, New York, 1879—Jan. 2d.

Kathleen-Derg—Dr. J. W. Downey's red Irish setter bitch Kathleen-Rufus-Collen to Baltimore Kennel Club's Derg—Jan. 10th.

True-Rattler—Mr. R. P. Baker's True to Mr. J. N. Dodge's Rattler.

Fan-Rattler—Mr. R. P. Baker's Fan to Mr. J. N. Dodge's Rattler.

WHELPS.—*Rose*—Mr. J. N. Dodge's imported setter bitch Rose, whelped Dec. 27th, 1879, three puppies; two bitches and one dog; two lemon and white and one white, black and tan; by champion Leicester.

Jinnie—Mr. W. H. Pierce's (Courtlandt Kennel, Peekskill, N. Y.) pure Gordon setter bitch Jinnie (J. R. Tilley's Mab, Jerome's Shot), whelped Jan. 2, 1880, nine puppies; seven dogs and two bitches, by Dr. S. Fleet Speir's Gordon dog Gypsum; all black and tan and evenly marked.

Genie—Mr. Henry M. Lewis' red and white Irish setter bitch Genie, whelped Jan. 17th, eleven puppies; nine dogs and two bitches; by Mr. D. W. Allen's Irish setter Nimrod. Nimrod was sired by Mr. Wm. Jarvis' Dick.

Fannie—Mr. J. Otis Fellows' cocker bitch Fannie (Jack-Topsey), whelped seven puppies Nov. 17th; six gyps and one dog, by Wildair—Doctor-Jose. All sold but two.

DEATH.—*Kittie O'Neil*—Mr. J. Otis Fellows lost his Irish setter bitch, Kitty O'Neil, from pleura pneumonia a short time ago; she was by Buck by Quail II. This fine bitch was presented to Mr. Fellows by Mr. Edward Lohman; she was as good as she looked.

NAMES CLAIMED.—*Doctor*—Captain R. W. Huntington, U. S. M. C., claims the name of Doctor for his black white and tan Gordon puppy (Glen-Border Lily), whelped Feb. 21st, 1879.

Brownie—Mr. George Maltby, Canisteo, N. Y., claims the name of Brownie for his cocker gyp. whelped Nov. 17th, Faunie Wildair, from the kennel of Mr. J. Otis Fellows, of Hornellsville, N. Y.

SALES.—Mr. J. N. Dodge, of Detroit, Mich., purchased from Mr. L. F. Whitman, of same place, a brace of setter bitches (one lemon ticked and one orange and white). Messrs. N. P. Boyce & Co., Coatesville, Pa., have in turn purchased same brace from Mr. Dodge.

Rolfe.—Mr. L. Hallock, Detroit, Mich., has purchased from Mr. J. N. Dodge, Rolfe (Leicester-Rose), litter brother to Coin.

Lee.—Mr, W. D. Hayes, Hastings, Mich., has purchased from Mr. J. N. Dodge, Lee, own brother to Mr. J. N. Dodge's Rattler.

PHOTOGRAPHS OF DOGS.—We have received from Mr. M. P. McKoon, proprietor of "The Blue Star Kennels," of Franklin, Delaware County, N. Y., a dozen or more excellent photographs of his cocker spaniels.

—Under the head of kennel advertisements it will be seen that Mr. Orgill has placed his celebrated pointer Rush in the stud; he is already so well known that remarks from us would be superfluous.

SETTERS AT AUCTION.—We call attention to Messrs. Lincoln & Hellyar's notice of sale of dogs in advertising column.

Archery.

MATERIAL AND LENGTH OF THE PERFECT BOW.

Editor Forest and Stream:—

Much has been written of late regarding archery, which was highly interesting to the writer, and, he presumes, to thousands of other readers of your valuable journal. The mists are clearing off. Now we begin to see our way to the possession of a truly perfect bow, and with no drawbacks too formidable to be overcome with a moderately replete purse and a medium stock of patience—a bow that will stand the wet brush and dripping woodlands, and still be quite as valuable for the target lawn.

Thanks to the numerous writers for all that has been divulged. With no word that is intended to at all discourage the many good bow-makers in this and other countries, yet, do you know, we have always looked with special favor upon the bamboo, and have expected more from it? It is cheaper than yew, and possibly excepting yew, nothing else yet used will compare with bamboo in flexibility of texture and elasticity of fibre—that is, a bamboo well backed. When Mr. Beecher said that Mr. Sutton and Mr. Malleson guarantee, I drove a nail. When Mr. Malleson, in speaking of Mr. Thompson's bamboo bow with the "faulty bend," said he uses a cement entirely impervious to moisture in joining the hickory back with the bamboo body of his bows, I clinched that nail. The archery-loving world would not wonder at our enthusiasm did they know how we have experimented with bows, and have had them fly into dust in hand, or pinch, or something else—enough to throw us back upon home-made swamp ash, which is a waste of time.

I don't know as the public would ask bow-makers to warrant their work, but it seems now as though they might voluntarily do so, and be safe enough. Looking over the long list of bows that Mr. Will H. Thompson tried, and noting the defects, is it strange that the road to success in archery, and security in implements, should startle the faith and confidence of a tyro? Yes; it does seem as if a better time was surely coming—nay, is already here. If cement has an inherent power against moisture, and can be used in all kinds of bows in place of glue, the great drawback to the construction of a really perfect bow is a thing of the past.

A perfect bow has a dual function—that is the function of the back and of the body and front. What is needed in the body and front is material possessing flexibility and elasticity; and these qualities are incompatible with one's idea of toughness. All substances fit to be used in making the body and front of a bow are necessarily brittle, by reason of their elasticity. The function of the back section is to preserve the other, and it must needs be of qualities the very opposite. It should conjoin toughness with inelasticity. It must be incapable of breaking. If the body and front will give the greatest results in quickness of recoil and strength of vibration—we do not care how brittle it may be alone—the back will preserve its integrity in the fulfillment of its function. So we have to combine these functions, and seek whatever material is needed in organic relation.

Mr. Aldred admitted that a yew-backed yew is superior to a self-yew in driving power. He prefers a self-yew on account of the glue, which suffers from dampness and extreme heat. That objection is done away with in the use of cement. When Mr. Aldred selects a section of yew wood for the back, I suppose he places the grain so as to get greater toughness by adapting that surface to tension which will stand a mightier strain. Only by so doing would his backed-yew be of more value than the self-bow. Mr. Sutton evidently thought as we have indicated when the rawhide suggested itself; though any substance that will stand the strain will do for the back, and if that substance possessed also a slight degree of elasticity we think it would be better still.

Now a word in regard to the proper length of a perfect bow: As there must be a point where a bow reaches its maximum in power of recoil and projecting force—taking two feet as the minimum, for instance, in practical length, going downwards, and beyond seven feet decreases its force going upwards—have we not being using bows of two great length when shooting with a twenty-eight inch arrow? I think so. Now, a bamboo bow in the hands of Mr. Beecher endured a strain while bending it to test its hardihood equal to an arrow measuring four feet and over. Then, granting that a bamboo bow of fifty pounds pull will endure the strain of a twenty-eight inch arrow, and only five feet long, we believe it will outshoot a bow of like weight and pull which exceeds the former twelve or eighteen inches. The reasons are obvious. The longer bow is put to less tension, having at the same time less sweep of limb in its longest diameter and more in its lesser diameter. A bow gets its projecting force in its quickness of recoil, which should resemble a "desperate and nimble stroke of quick cross-lightning." Make a bow of inelastic timber, or wood that is nearly so, and let it measure twelve feet in length: let it have a resistance of fifty pounds weight, or make it equal to the shorter one you are experimenting with; use the same arrow in trying it, and note results. Of course a bow may be too short. We are talking about bows long enough to stand the strain of an arrow twenty-eight inches long.

A bow made of bamboo will rapidly near the breaking point after a twenty-eight inch draw, as it shortens from five feet downwards. Were I to order a bow made by any of our expert makers, I would ask for a bamboo, backed with good, close-grained hickory, or rawhide, five feet long, of fifty-five pounds pull. I should expect a weapon fit to associate with the best footed deal arrows, 5. 0. weight. A bow like that ought to take the kinks out of trajectory at 100 yards. Notwithstanding all this I might prefer a rawhide-backed yew; that would cost as much as would buy three bamboos, and at the present price of bows, I much prefer to take my chances with three bamboos than one self-yew, or a yew-backed yew.

A word more about trajectory. We all want it flattened out at 100 yards, or even sixty yards. I want my arrow, while flying from the string to the target, to kiss, as near as possible, its every inch of way, the straightest air-drawn line. It's the sky-scraping curve which kills our points in score. Could a shaft be sent with no more curve than a ball from a Ballard rifle makes, an archer like Mr. Thompson would pick the very pupil from the target's eye. I do not believe we can hope to gain that end by using heavy bows and arrows so light that the stroke of the bow cord will bend them; but by using a shaft as light as can be and still "stand," and sent from a bow with all attainable power.

When reading Mr. Will. H. Thompson's article about bows, I noticed that with all therein mentioned, he said nothing about red cedar bows, at least I remember nothing. The Indians of King Phillip's time used a bow of red cedar, and it is said they were excellent weapons. The writer believes a good straight-grained billet of red cedar would almost, if not quite, equal yew and bamboo, after being backed with hickory. That it would possess immense flexibility and softness of recoil could not be questioned. I hope some of our expert bow-makers will give it a trial and report results. I have not intended in my remarks to say ought by which any one might infer that other makers than those who manufacture the ones I have spoken of in particular, do not produce good reliable bows. I believe that almost any of the makers named by Mr. Thompson are capable of putting together a bow not inferior in any point to those I have designated. Each one of them have constructed excellent implements for the target lawn. In this, as in every art, the chance for improvement offers itself. But the outlook to-day seems better than ever before. M. D.

—The following unpublished 60-yard scores were made shooting in the Exposition Building, Chicago:—

	1st 24.	2d 24.	3d 24.	4th 24.	5th 24.	6th 24.	*Total.*
Mr. Carver	16- 76	21- 91	24-142	23-115	20- 92	22-112	126 630
Dr. Weston	21-109	22-101	22-102	17- 73	24-124	20 110	126-622

Mr. Carver also made the following scores with 60 arrows at 60 yards:—

	1st 30.		2d 30.		*Total.*
Mr. Carver	30	174	29	147	59

A REMARKABLE ECHO.—The New Orleans *Picayune* thus describes an echo discovered by two gentlemen who had crossed Atchafalaya Bay from Morgan City to Berwick, and had occasion to call for a friend who had been left behind. "The distance across is less than half a mile, and the human voice can easily reach it. A prolonged call was made, and the parties listened for a response. In about 15 seconds, to their surprise, this same call came back, with all the peculiar inflections of voice that were given in the call. Thinking some one was on the other side the party recited verses in Italian, Latin, and Spanish, and after a delay they came back, the echo repeating as many as 20 words distinctly. Unlike most echoes, this of Morgan City repeats whole sentences.

Answers to Correspondents.

☞ *Correspondents who may send us their proper name and address will always receive prompt attention in these columns. We require a man's name for two reasons: (1) sometimes as a guarantee of good faith, and (2) always as a matter of common courtesy. As a rule we do not reply to inquiries by mail, except in cases demanding immediate advice.*

W. S. K., Lawrenceville, N. J.—We know of no excursion to Labrador projected for the coming summer.

J. L. M., Nobonis, Ill.—We published description and cut of the migratory quail in our issue of June 26th, 1879.

CANADA, Tilsonburg, Can.—You may address the English firm through their New York agents, Messrs. Hartley & Graham.

D. K. F., Baltimore.—For "Sporting Sketches with Pen and Pencil," address the *Field*, 346 Straud, London. Price £1 1s.

D. P. B., New York.—Take your inventory of goods at cost and charge difference between that and present market value to profit and loss.

G. M. T., New York.—You will find an excellent game country about Fort Custer, Montana Territory. See a description of the same in another column.

W. W. C., New Orleans.—We cannot act as agents for the purchase of dogs. Your best plan is to advertise for the dog wanted, or to reply to the advertisements in the paper.

S., Danville, Ky.—We published description and illustration of the McDonald fishway in issue of Jan. 16th, 1879. You may address the inventor, Colonel M. McDonald, Lexington, Va.

J. H., Mount Royal, Fla.—Clean the part affected with warm water and then apply three times a day a weak alum wash, or lotion, of sulphate of zinc, three grains to an ounce of water.

G. S., Buffalo, N. Y.—Mr. M. P. McKoon replies that photographs of his cocker spaniels can be obtained of Mr. J. F. Waters, artist, Franklin, Delaware County, N. Y. Price 25 cents each.

NOVICE.—A correspondent owning a small sloop inquires of our readers concerning suitable cruising grounds in New York waters, their dangers, special recommendations for short cruises, etc.

A. G., Bristol, Pa.—No substitute has yet been found for the glass ball. A dozen or more inventions have been tried, but no one of them appears to have successfully taken the place of the glass.

BARNEGAT SNEAK BOX.—Richard R. Lane, Bayville, Ocean County, N. J., will build sneak box complete, twelve to fourteen feet, white cedar and oak, galvanized fastening, sail, oars, anchor and cable, for $35.

R. W. S., Boston, Mass.—The extreme accurate shooting range of a Winchester is 600 yards. The ball will carry twice that distance. For purposes mentioned the rifle and gun you name are amply sufficient.

B. R., Buffalo, N. Y.—1. Is a peepsight allowed in matches of 200 yards? 2. Is it considered off-hand shooting to rest the elbow against the body? 3. Is it necessary to fill hollow of Express bullet? Ans. 1. Yes. 2. Yes. 3. No.

J. A. C., New York.—Try the makers of yacht engines in Liberty street and Cortlandt street. If they have no bed-plate, you must have a pattern made and get one cast at any foundry. Will not be expensive. Take measurements from a four-horse-power engine in the shop.

MAINE.—What is the best dog I can procure for hunting partridges, and also use as a watch dog? Ans. Either a setter or a pointer for shooting grouse over; and many dogs of both breeds are excellent as watch dogs, too.

W., Grafton, Mass.—Please give me what information the rules of FOREST AND STREAM admit of as regards the very best rifle for downright business and killing powers among large game? Ans. The Winchester repeating rifle.

MRS. N. A. T., Houston, Texas.—The mocking bird lays four, sometimes five eggs of a cinerous blue color, marked with large blotches of brown. She sits fourteen days, and generally produces two broods each season. Sometimes when robbed of her eggs she will lay the third time.

M. S., Chicago.—We have already stated our belief that a prudent man will not invest in $4.50 repeating rifles, no matter how flaming the announcements may be. We have refused the advertisement of the cheap rifles you refer to, because we do not believe them to be desirable goods.

WILLIE W., Williamsport, Pa.—Powdered bi-carbonate of potash, one ounce; powdered white vitriol, one-quarter ounce; subsulphur, two ounces; lard, eight ounces—mix and rub well into the skin. Continue with the Fowler's solution of arsenic, but administer only after the animals have been fed.

J. R. R., Cleveland, O.—We cannot discriminate among guns, saying that one is better than another. The general rule is that a man who has used only one make thinks that that is the best in the market. The gun firms who are represented in the advertising columns of the FOREST AND STREAM are reliable, and further than that you must select according to your own tastes. Any of the medium-priced guns sold by them—either of domestic or foreign make—will last you a lifetime.

H. W., Shelbyville, Ind.—1. What is the best and cheapest target for mid and short range rifle shooting, guns using 45-70 cartridges? We have only six members, and cannot go to much expense. 2. How can I cure my setter dog, fifteen months old, of gun-shyness? Ans. 1. Canvas stretched upon a light wooden frame, with paper diagrams, would be the cheapest target and a very serviceable one. 2. Within a very short time we shall publish several articles on gun-shy dogs and their handling. Let us know if you have already made any attempt to cure your dog, and if so, what you have found to be of no service.

CONTRARY BOB, Princeton, N. J.—1. Can an American go to England and buy a finely bred dog from an English gentleman? 2. How generally do we obtain highly-bred dogs from English kennels? 3. Are there not men in England not of the gentry who breed fine dogs for sale? 4. Would it be difficult to breed their dogs to the stock of the gentlemen? Ans. 1. Yes, if they are willing to pay owner's price. 2. The dogs are most often selected by a purchasing agent, although there are some breeders in England with whom it is safe to deal by letter. 3. Yes. 4. No. 5. Large prices for dogs are not rare. The St. Louis Kennel Club purchased Faust, it is said, for $1,250, and Mr. Llewellin paid Mr. Brevis $2,500 for the setter Dash II.

☞ CHARLES HALLOCK, having closed his connection with the Forest and Stream Publishing Company, may now be found at his office at 61 Broadway, room 23, where all personal letters and communications should be addressed.

FOREST AND STREAM
ROD AND GUN

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

FOREST AND STREAM PUBLISHING COMPANY,

—AT—

No. 111 FULTON STREET, NEW YORK.

[POST OFFICE BOX 2832.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Advertising Rates.

Inside pages, nonpariel type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial column, 50 cents per line—eight words to the line, and twelve lines to one inch.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

***Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, JANUARY 22, 1880.

To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith and be addressed to FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. Anonymous communications will not be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of mail service if money remitted to us is lost.

☞ Trade supplied by American News Company.

A HIGH COMPLIMENT.—It is always pleasant to hear nice things about oneself, and compliments become doubly valuable when they are paid by one whose judgment is undoubted and whose sincerity is unimpeachable. It is therefore with much pride that we quote a remark in the last *Bulletin* of the Nuttall Ornithological Club from the pen of Prof. J. A. Allen, of Cambridge, whose standing in the very first rank of American scientific men is so well known to our readers. He says:—

"Journals devoted to field and aquatic sports, to practical natural history, and the preservation of game, are frequently chosen by excellent field naturalists as their mediums of publication, and in this respect none is more prominent than that deservedly popular newspaper, FOREST AND STREAM, which in tone and literary standing is a model of its class."

Praise from such a source is praise indeed. We shall study more than ever to deserve such kindly words.

—An Austrian *savant*, who has been prosecuting linguistic researches in South America, has discovered among the Indians of Peru and Bolivia languages which exhibit the most astounding affinities with the Semitic languages, and by a series of other equally "surprising revelations" the learned doctor concludes that the high plains of those countries must have been the cradle of the human race. That is to say, that Adam was a Peruvian and shot his game with a blow pipe and poisoned arrow. We fear that the Austrian gentleman left his compass in Europe.

—The Maine country has been fully described from time to time in these columns. The FOREST AND STREAM literature upon the subject is by no means inconsiderable; and it will be further augmented by a pleasing addition when Mr. Steele's papers, now in course of publication, appear in illustrated book form under the title of "Canoe and Camera."—Those of our readers who may remember the extended sketch, "Fishing in Oregon," published some time ago, will welcome another equally interesting paper from the same pen to-day.—The markets just now are filled with the products of the South, and catching the spirit of the season, we provide this week a supply of good things from the the same source. We shall supplement these descriptions of Southern sport with a further installment next week. There is always a dash about field days at the South. Scores of contributors who have penned their descriptions for the FOREST AND STREAM have been very successful in transferring this dash and action to the printed page.

FISH FOOD AS A POISON.

THE poisoning of dogs by salmon food, mentioned by an Oregon correspondent in another column, is one of the phenomena of the poisoning properties of fish as food. No branch of the whole range of toxicology is more curious than this of fish poison; its principles and laws are little understood by laymen and have baffled the most intelligent investigation of experts.

Not only do certain fishes possess this toxic property at all seasons and with all who partake of them, but there are also numerous other fishes which appear to act as poisons only at certain periods, and not at others, or upon certain individuals and not upon others. Whether the malady ensues from the condition of the fish diet itself or from the condition of the person eating it, is also an undetermined point. As we should naturally expect, curious superstitions and misconceptions have attended such phenomenal results; among them we suspect should be classed the moonlight belief so fully set forth in the FOREST AND STREAM some months ago. Here the sickness which followed the consumption of the fish may have been induced by a particular morbid element of the fish itself, or by an idiosyncracy of those who partook of it. There are allied phenomena in other branches of toxicology. One man walks with impunity through the poison ivy, thrusts it aside with his hands, and allows it to brush against his face; another receives the virus by simply coming into close proximity to the vine. Here it is very evident that one individual is more susceptible of poison than another. The fact that one man of a ship's crew who eats fish from the same dish with his fellows and is seized with terrible spasms of pain while they are unharmed, is an analogy to the ivy poison.

In the *Annales d'Hygiène Publique*, the report of the Inspector General of Chinese Customs is quoted as stating that fish poisoning is among the maladies which afflict Europeans resident in Japan. The author mentions salmon as the most common toxic fish of Japanese waters, the effects of eating it when out of season being such as follow the eating of tainted meat. The same danger attends the *katsuo* (bonito) and the *maguro*, although fatal results rarely follow; the worst symptoms, as they are the most inexplicable, being a severe conjestion of the brain and face and serious nervous derangements. Another curious condition has been observed with regard to one of these poisonous species, the *Lethrinus nambo*, which is that it can be eaten with impunity until it attains a length of five or five and a half inches, after which it becomes poisonous. The most dangerous of the Japanese poisonous fishes belong to the order *Plectognathus*, and are of the genus *Tetrodon* or swell fish, known in Japan as *fugu*. So well recognized are their dangerous effects, that their sale at certain seasons is prohibited by law. The symptoms following them are at first violent headache and nausea, quickly followed by extreme muscular weakness, and a simultaneous falling of the pulse, respiration and temperature, all denoting the very energetic action of the poison upon the nervous centres and the pneumogastric. Another circumstance noted by two physicians, who have recorded sixteen cases of poisoning by this fish, was that the victim had in every case eaten the eggs of the fish. The liver just after the spawning season is considered in Japan to be the most fatal part. In the cases reported from the Cape of Good Hope death ensued within seventeen minutes after the victim had eaten of the liver of the *fugu*.

Fishes of different genera all over the globe possess poisonous properties more or less definitely determined and commonly recognized. Pappenheim gives a list of more than forty such species, including the mackerels, perches, pikes, herrings, congers, and barbels. The importance of this subject is such that it deserves the most careful investigation. With the attention which is now devoted to all branches of ichthyology and kindred studies, we may reasonably look for the attainment of a more definite understanding of the poisonous properties of fishes.

SHOULD THE GUN BE TAXED?

GAME protective legislation is no new thing in America. We published the other day a Connecticut law enacted in 1868, and to-day we give a Canadian statute of the last century. The game law which gives full satisfaction, and against which the offenders are as promptly and as generally punished as the offenders against other laws, has however yet to be found. We have been discussing different phases of game legislation for the past seven years in these columns, and from time to time we have noted a step in advance. The laws are better to-day than they were ten years ago; public sentiment is more favorable to protection than it was then. The leaven has been slowly working. We are not despondent of the future.

In another column a thoughtful writer suggests that a county tax be imposed upon every non-resident who comes into the county to kill game. Any suggestion which is designed to forward the attainment of an efficient system of game protection, is worthy of consideration; and we now desire not so much to express our opinion as to obtain the views of those who have been in the thick of the fight against lawless game extermination.

To insure protection it is not enough to pass laws. One law defied cannot be enforced by the enactment of another; nor the second by a third. Many of our States have twice as much legislation upon the subject as they ought to have, and with not one-tenth of the actual execution of the laws called for. We have long ago found out that protection is not to be secured by fixing close and open seasons, and prescribing penalties for their infringement. Special officials must be appointed to enforce the statutes, bring offenders to justice, and inflict the penalties. We believe that those Associations which have advocated the appointment by the States of special county game constables, have hit upon the only true method of satisfactorily protecting the game. Experience has also shown that such constables must have assigned to them a territory outside of their own neighborhood, where personal considerations can have no influence in deterring them from a discharge of their duties. And it stands to reason that no man will take very energetic steps in this business unless he be paid enough to make it worth his while. Any adequate system of game protection must necessarily be attended with considerable expense. Where are the funds to come from? It is self-evident that the constables must be appointed by the State, that they may be clothed with unimpeachable authority, may be, in turn, responsible to the State for the discharge of their work, and may not hold office subject to the whim of the county citizens. It follows that they should be paid by the State; and for this purpose a fund ought to be appropriated sufficient to meet all due demands. Game protective associations may accomplish much by voluntary contributions; our most determined societies are yearly devoting less money to State shoots and more to State protection; but the fund proper must come from the State. For the provision of such a game law fund is urged the imposition of a tax upon guns. It is the old and approved principle that those who dance must pay the fiddler. The collection of only a nominal tax upon every gun in the State of Massachusetts, or of New York, or of Michigan, would furnish the means of employing in each of those States a corps of efficient and fearless men to see that the laws were carried out: it would be sufficient to pay the salaries of constables, the fees of counsel and the prosecution of the constables themselves when they shirked their work or put hush-money into their pockets. Enforcing the game laws is now nobody's business, and they are not enforced. If a community of sportsmen were taxed to secure their enforcement, every one of the men thus taxed would make it his business to see where his money went to. Another advantage gained would be the rescue of game legislation from a clique of interested parties and putting it into the hands of men who would see that when a close season is fixed, it is the one prescribed by nature and common sense. If the law is to be enforced and men know that it is to be enforced, they will take pains to see that it is right. The result will be salutary all around. They have come to this in other countries; we must eventually come to it in the United States. We shall be wise if we come to it before our game has so nearly disappeared that game constables and taxes shall be of no avail.

YACHT RACING NOT DECLINING.

WITH the advent of the winter months the usual crop of critics appears as a matter of course to bewail in sundry contemporaries the "decline of yachting." We have before had occasion to call the attention of hasty reviewers of the amateur class, who have no statistics at hand, that yacht racing cannot under any conditions be taken as an index of the pulse of the public. Because the entries for any one match or even for racing throughout the year may sensibly decline, there are not necessarily any just grounds for jumping to the conclusion that the sport is suffering from want of popular favor. On the contrary, the number of entries is governed to such a degree by secondary and special considerations that they cannot be treated in connection with yachting as a pastime generally. The New York Y. C. had only a moderate entry for its annual matches last year, yet the cruise of the club brought together the largest fleet and tonnage ever under the command of a flag officer. But apart from this, yacht racing is no more declining than yachting itself, as the following statistics will serve to show. We may add that never before was the prospect of this sport in all its bearings brighter than at present. A very large number of new craft are being built, and most of them of fair tonnage. The absence of the vulgar ostentation and frivolous display in the way of "big" schooners, and the noisy splurge of advertising which once characterized our yachting has fortunately disappeared, but this must not be confounded with a lack of popularity. It indicates rather that rac-

ing and cruising is now undertaken from the sounder standpoint of the sailor and Corinthian, who follow the sport for the love they bear it, and not as a means of spending suddenly acquired wealth, or as an exhibition of *nouveaux riches*, who own yachts simply because fashion calls it *en règle*, without caring a button for the underlying benefits and science of this noble recreation.

A comparison of the figures in the following table will show the rapid strides made in racing during the past five years, and exhibits the transfer of the yachting centre from New York to Boston and Eastern waters, as well as the development of sailing in Philadelphia, the South and upon the Great Lakes :—

Classification of Racing.	1875.	1878.	1879.
Total number of starters	.....	2573	2365
Total number races sailed	144	247	261
Total number prizes won	436	713	684
Total number prize winners	307	467	508
Average entries per race	.....	10	9¼
Av. number of races by each winner	2¼	2¼	2 1-5
Races in Boston and East	48	80	107
Races in New York waters	59	61	53
Races in Philadelphia waters	5	26	32
Races in Southern waters	7	13	20
Races, Lakes, West and Old Dom	20	44	55
Clubs represented in races	45	49	58
Number winners over 40 ft. w. l.	....	31	38
Number winners under 40 ft. w. l.	...	436	470
Number racers cat-rigged	...	130	132
Number racers sloop-rigged	.....	167	205
Number racers schooner-rigged	.....	24	31
Number racers other rigs and unclassified	.....	116	140
Club sailing most races and number	.....	R.N.Y.Y.S. 9 races. 48 startors.	Bev. Y. C. 10 races. 177 start'rs
Greatest number races by one yacht	Eva, Bev Y.C. 13 starts.	Fancy, Bev. Y. C. P.Grant, Jr. 20 starts. & Psyche, Bev Y. C. King & Cl'k 20 starts.	Fancy, Bev. Y. C. P.Grant, Jr 18 starts.

A CASE OF TRUE HYDROPHOBIA.

AN interesting case has just transpired in New Castle County, Delaware, furnishing another example of the danger to the community at large from allowing rabid dogs to range unrestricted through a country district. This particular section appears to have been specially selected for the visitations, as four cases of the disease have occurred during the current year. Mr. R. G. Alexander was the last victim. Early in December last a strange hound, whose muzzle and shoulders were covered with bloody froth, appeared in the village, attacking and biting all of his tribe that he met. Seeing Mr. Alexander nursing a little pet dog as he sat with him in his lap on a bench by the door, the strange dog rushed at the victim and fastened his teeth in his cheek and mouth. Resuming his course, dogs and horses were bitten, and the rabid animal only met with his death at a distance of four miles from the scene of his assault upon Mr. Alexander. This gentleman appears not to have realized that the animal was mad, and his friends jealously avoided the subject in conversation. A week subsequently a physician cauterized the wounds, and he took freely and assiduously a mixture of elecampane root, much thought of by country people as a remedy for dog bite.

Other remedies having similar supposed virtues were taken in the prescribed doses and at the regular intervals. During all this time he had no symptoms of nervousness or apprehension. On the forty-second day the fatal issue was ushered in by a slight chill, followed by pain in the back. This was upon Tuesday the 11th inst. On Wednesday his nervousness and anxiety became marked. On Thursday he showed a disinclination to take his morning bath and refused his cup of coffee with abhorrence. The side of the cheek and nose that had been bitten became swollen and sensitive to pressure, indeed they evoked spasmodic contractions of the muscles. Relief was at first obtained by the ebolition of morphine, the bromides and chloral, which were administered by the mouth. Soon, however, the spasms of the muscles concerned in swallowing and breathing made the task of giving his medicines in this way so great that the hypodermic needle was resorted to. Partial and temporary relief was obtained, but it was found that Woorari, the famed South American poison, which has the power of annulling muscular spasms, only aggravated the symptoms. As is usual in the cases, chloroform and morphia were found the sheet-anchors. The days of mental and physical agony terminated finally in death from physical exhaustion. This case is another instance of the fact that true hydrophobia is uniformly fatal. No remedies have ever been known to arrest the terrible disease when once it has been fairly under way.

While our readers should remember that rabies has such a terrible record, it is even more valuable to know that there are other diseases which imitate it and are of a purely nervous character. When the case is one of real hydrophobia there are always severe spasms of the muscles concerned in breathing and swallowing ; there is unnatural excitability of muscles in parts distant from the injury ; and the attacks are paroxysmal. Lyssophobia, or imaginary hydrophobia is not uncommon after dog bite. So, too, hysterical and epileptic persons may and will at times give all the symptoms of hydrophobia, imitating the symptoms they have seen or heard described. It is all important after a dog-bite, even from a rabid dog, that persons should not be needlessly alarmed. The first thing to do is to suck out the poison with the lips ; it is an old method which in certain parts of France is pursued by women, who receive ten francs for the first operation, and five for each succeeding one. Then the actual cautery (a bit of red-hot iron) may be applied, or some strong mineral acids, such as nitric or muriatic. It is a matter of common knowledge that the vast majority of dog-bites, being by animalst hat are excited, produce no subsequent trouble.

THE "ASIAN."

THE sun never sets upon the lodge of the English sportsman ; the crack of his rifle follows the dawn around the globe. That is not just what Webster said, but his famous sentence about the vastness of England's possessions was not more true. Your Englishman is a sportsman all the world over. He flies his burgee in every sea ; his tent has whitened the mountain side of every range on the globe ; there is no fish in the seas and rivers which has not been caught by a Briton's hook ; no fowl of the air or beast of the forest which has not fallen at the report of an English gun. The rifle and fishing-rod form part of every mercantile or diplomatic outfit.

The Englishman, too, not only practices sport in the field. He talks it and writes it. Lord Dufferin, Governor-General of Canada, contributed an elaborate paper on Moose Hunting to the *Nineteenth Century*, one of the "heavy" periodicals, and James Anthony Froude, in another of the ponderous reviews—the *National Quarterly* —devoted the rare talents of a great historian to the discussion of the cruelty of fox-hunting. Charles Kingsley, clergyman, novelist and poet, never wrote more charmingly than when describing the winter woods and the wild excitement of the chase. This passion for writing and publishing is as much a test of your true Briton as it was to have been born within the sound of Bow Bells.

There comes to us every week from Calcutta the *Asian*. This is to India what the London sporting papers are to England, and what the FOREST AND STREAM is to America. It is the representative of the guild of sportsmen, and its pages, filled with notes from hunters, anglers and naturalists, are so thoroughly characteristic of the craft that we shall for a moment imagine the reader of the FOREST AND STREAM looking over our shoulder while we turn over those pages of our Eastern contemporary.

First and last of course come the advertisements. The cut of the waterproof hunting pants is strikingly like that which appears in our own advertising columns, and then follows the regulation notices of guns, rifles and fishing-rods. But they advertise everything in a sporting paper in Calcutta, as they do in London. That's where they are ahead of New York.

A large proportion of the *Asian* is devoted to the turf, and just how salutary an influence a sound journal may exert in India, as in America, is indicated by the vigorous editorial leader on "Turf Reform in India." Then follows an appreciative memorial note by one of the *Asian* contributors : "A man of iron frame and undaunted courage, who perhaps met death in the form most acceptable to him, when he was shot down while leading a charge of the gallant 44th up against the Naga's stronghold at Konoma." The standard of true manliness is the same in England and America ; its possessor is honored and beloved, there or here alike, in the field of sport and amid the sterner duties of the campaign.

The "Sporting Notes" are a curious collection of news from all the four quarters of the globe : Indian steeplechases, a Java buffalo-tiger show, turf; gossip from Australia, England, Ireland and America ; the Hanlan-Courtney *fiasco*, Brodie's walk against a horse in San Francisco, Daft's cricket team in America, and boating notes from Oxford and Cambridge.

In the column of Shikar, "A Poacher" relates an amusing incident of tiger hunting. The method employed was to build a frame over the carcass of a bullock, slain where the tracks of the tiger had been discovered ; upon this frame the hunters perched and awaited the approach of their victim. But instead of coming just as they had planned, his majesty made his appearance from the rear, and stationed himself so near that his breathing was plainly audible, and for four hours those luckless huntsmen lay with bated breath awaiting his spring. But the brute did not sup on Englishman that night ; he slunk off with ominous growls, and our friends came down from their perch, stretched their cramped limbs and did their tiger shooting thereafter on paper.

The "Correspondence" column is very much like our own, being made up of questions in rifle shooting, the care of dogs, shooting grounds, etc., etc. One man wants to know whether all horses have the faculty of swimming instinctively ; another broke both fore legs of a buck which afterwards ran forty yards on his hind legs, and the writer wants some one to match the incident ; and another writes about the method of making a bamboo spear shaft for sticking wild boars. And here too is our old friend who wants to know, you know, if rowing developes the muscles ; we are glad this fellow has gone to India ; he used to send his queries to the FOREST AND STREAM.

The angler who is versed in the points of his craft in India could certainly give points to a novice. Here is a bit of characteristic instruction, of which good old Sir Izaak makes no mention :—

Do you see those monkeys moving about, feeding in those trees down there ? Mark the place, for we must fish it carefully when we come to it. My impression is, that when monkeys are moving in trees overhanging the water, the result is that more fruit and more insects drop down into the water than ordinarily, and that the fish congregate more or less from the neighborhood to watch for them. As you get nearer, and the monkeys notice you, they will commence vociferating and violently shaking the boughs, which will still further improve the position.

The writer's guide, Kuti, is a jewel—albeit an ebony gem. When he says there are fish in a pool, the fish are there. He never makes a mistake, and when complimented on the superiority of his attainments, naively explains, "I have eaten blows from many gentlemen." This Kuti, by the way, is no chicken. He could run a boat down a rapid with as much dexterity and frontier skill as the most daring of the guides and canoemen whose feats are comemmorated in the pages of the FOREST AND STREAM.

The sportsman is always a naturalist. No resemblance of our own columns to those of our Asiatic contemporary is more striking or more gratifying than the evidence on every page that the writers are intelligent and inquiring men, whose only thought is not of bagging their game. The readers of the *Asian* have opportunities for natural history study in many branches not open to the American ; nor are these opportunities always of the most enviable character. We confess that for determining one question mooted by the *Asian's* correspondents, namely, the height of tigers, we are content with the facilities afforded by the stuffed specimens in the Museum of Natural History at Central Park, and we are perfectly resigned to hand over the tape measure for our friends to use in the jungle.

The hunting customs of savage nations are among the most curious subjects encountered by the student of the early history of mankind. It is not strange that those tribes which live by the chase should carry it into their religion, morals and social rites. There are some queer notions among the Andamanese who live on the Andaman Islands in the Bay of Bengal, concerning whom a writer in the *Asian* quotes from a paper contributed some years ago to the Asiasic society. We may premise the quotation with the hint that if Mr. Blackford or some other enterprising fish dealer should import a supply of *Goom-dah*, he would soon win fame, fortune and the gratitude of his country ; or, possibly, this comes within the scope of the Fish Commission :—

They marry as soon as they are able to support a wife, and I understood that the rule was only to have one. The faithful swain eats a peculiar kind of ray fish, termed *Goom-dah*, which gives him the title to the appellation of *Goom-mo*, signifying a bachelor desirous of marrying. Girls arriving at a marriageable age wear certain flowers to distinguish themselves by. Before marrying, young men take a species of oath, after which they sit very still for several days, scarcely taking any food. Those who have been pig-hunters refrain for one year—commencing in April from eating pork, using turtle, tortoise or fish instead ; but they do not cease hunting pigs, as they are necessary for the food of the tribe. The turtle hunters, in like manner, use pork during this probationary year, and during this period honey must not be tasted. This is apparently done for the purpose of ascertaining whether the individual is able to support a family.

The writer then tells us how the monkeys in the Sandarbans catch crabs, and with this quotation we must close our review :—"The crabs are generally found in holes in the ground, under water, where these monkeys are unable to lay hold of them. They therefore adopt this ingenious expedient : They place their tails into the holes, and as the crabs catch hold of the caudal appendages, the monkeys spring forward and bring their unwary victims out of their hiding-places."

CREEDMOOR MATCHES.—The report of the matches at Creedmoor for the past season, published in a compact form in our rifle columns, will enable a comparison to be made of the scores on this mother of the ranges and those made on other ranges the country over. The conditions of each match are given that readers may judge what style of shooting is open to the marksmen at Creedmoor ; the winning rifle is in all cases given with the record of the shooting. In all cases each of the matches was kept upon the monthly programme and open for members, and in very many cases the matches failed to get the ten entries required by the rules of the Association. The ru in this respect was changed, and late in the year competitions were held with two contestants, and should it occur that but one entry should present himself at the firing point he would be entitled to a walk over. It will be

seen that running deer shooting has been a flat failure, as was the Remington long-range match with all its limitations. Long-range shooting generally has been in an almost total state of neglect, and the rush has been for short-range off-hand marksmanship and for matches in which the military guns could be used and in which the scores made could stand as official records for the State Marksman's Badge, with the advantages of spending a half day instead of a whole day of going in citizens dress instead of in uniform, of being able to make trials again and again for the Marksman's Badge.

This exhibit enforces the unwelcome fact upon the attention of the N. R. A. Directors that Creedmoor is not holding its own among the ranges of the country. Walnut Hill is to-day the leading range of the United States. There are congregated the best company of long and short range shooters, and there the best records are to be looked for each week. Creedmoor must extend itself. With the great cities of New York and Brooklyn at its side there should be thousands of marksmen instead of the scores now going down to the range. To have matches lapse month after month for want of a dozen entries, shows either that the conditions of the match are such as to repulse marksmen, or that the range lacks patronage. Both of these causes are in operation at Creedmoor. The fact is, that except in special matches the programme of the N. R. A. Range is left severely alone by marksmen, and it will be the task of the new blood in the Board of Directors to make up matches worth the entering and then to see that they are filled.

GAME PROTECTION.

—On the road between New Milford and Vernon, in Sussex County, N. J., there are two adjoining farms, the owners of which are not on very friendly terms. One has an immense sign posted by the way, which says, "No hunting or fishing allowed on this property." His neighbor, somewhat of a wag, also sports his large sign board, which proclaims, "Hunting and fishing allowed on this property. Woodchucks and suckers a specialty." And yet they are not happy.

AN ENGLISH HARE PRESERVE IN NEW JERSEY.—A company has been organized to secure a plot of 220 acres in the township of East Brunswick, N. J., for a hare preserve. It is proposed to fence in this tract and import a number of hares from England to stock it. The stock of the company is divided into one hundred shares of $100 per share, payable in monthly installments of $10. The profits accruing from the shooting fees and the sale of hares in market are to be divided *pro rata*, and the projectors of the scheme are sanguine that both pleasure and profit will attend their enterprise. We see no reason why they should not be successful; indeed game preserves will be remunerative investments in America before many years.

SHOOTING DOGS AND TAXING GUNS.—In reply to a correspondent in our impression of Jan. 1st, a Boston friend sends the following suggestions. We agree with the writer in part, that a tax on guns is one step towards the solution of this vexed question of game law infringement. As to hounding and still hunting, we shall shortly publish a most important contribution to the literature of the subject, a discussion so full in fact that our readers may at least avail themselves of all the facts bearing upon the case:—

While disagreeing with your correspondent in the relative merits of the two methods (I understand "still-hunting" to be a synonym for stalking), I fully concur with him in his just denunciations of the cowardly practice of killing or maiming hounds. Certainly no one of sportsmanlike instincts could be guilty of such practices, and from personal observations I am inclined to believe that such acts are in general perpetrated by residents who are not sportsmen, but who in their leisure hours kill deer for food or for the market.

These men, who have encountered many privations and hardships in making their frontier homes, are, not unnaturally, in the habit of considering the adjacent wilderness as their peculiar property, and when a party from a distance with superior arms and trained dogs come into their neighborhood and kill or drive off the game, they are prone to regard it as a trespass and take summary measures to discourage it. The better class of residents may not approve their course, but they will be loth to take the part of strangers against their neighbors, and it is a very difficult matter to identify, and a still more difficult one to legally punish the guilty parties.

My purpose in writing is to propose as a remedy for this widespread evil, the enactment in the game States of laws empowering county authorities to levy a gun tax upon each person who comes into the county to shoot, and a per capita tax upon hounds or hunting dogs brought with them. A license certificate should be given in exchange (for the season)—good in any part of the State, or at least in contiguous counties. The proceeds of this tax should be held as a fund from which any person who presented satisfactory proof of the killing or maiming of his dog through malice should be paid the value of the animal. The balance at the close of the season could properly be devoted to the school fund or other public use, and thus the local community would have a direct interest in protecting the hounds and affording facilities to sportsmen. Each inhabitant would become a detective, and none of them would dare to kill a dog for fear of his neighbors. The sportsman would be relieved from the troublesome duty of prosecuting, and the local authorities have a strong stimulus to perform that duty. I should think that ten or fifteen dollars for gun and two dollars for dog would be a fair amount for the license. While this would not materially increase the cost of a hunting trip it would be more than repaid in the sense of security with which owners of hounds could pursue their sports, and the much abused "still-hunter," when viewed in the light of a tax-payer, would probably find his warmer welcome by the inhabitants a fair return for his payment. C.

NEW YORK—*Johnstown, Jan. 19th.*—At the annual meeting held Tuesday, January 13th, of the Johnstown Game Protective Association, the following officers were elected for the year: President, M. S. Northrup; Vice-President, Rev. James A. Williamson; Secretary, Wm. F. Young; Treasurer, Donald Fraser: Executive Committee, L. Frank Northrup, James H. Pike, James F. Mason; Attorney, James A. Dennison.

HIGHLAND GUN CLUB.—*Peekskill, N. Y.*—There has been recently organized in our village a society which we call the Highland Gun Club. Its object is the protection and propagation of game in our surrounding community. The club is so fortunate as to have for its President Mr. William D. Southart, a gentleman and thorough-going sportsman, who will never show mercy to violators of the Game Law. At the same time, we intend enjoying ourselves occasionally at the trap. H. B. W.

NEW JERSEY—*Bordentown, Jan. 5th.*—At the annual meeting of the Cranmer Shooting Club, the following officers were elected to serve for the ensuing year: Fred. G. Wiese, President; Capt. H. L. Cranmer, Vice-President; Dr. W. H. I. Hilliard, Treasurer; Milton W. Maitland, Secretary.

MIGRATORY QUAIL.—*Pittsfield, Mass., Jan. 14th—Editor Forest and Stream:*—I am pleased to report the success of our new game bird, the migratory quail. Our game club imported 200 of these spruce little fellows and scattered them a year ago last spring. In September a friend of mine shot two on a farm about two miles out where the birds were let loose. Being anxious to try the dog on them I went to the spot next day with my friend, but I could not raise a bird. I intended to go again, but business prevented. The farmer, however, told us some time later that they had gone. He said the year before he had flushed them several times, and there were eight of them, and that last fall there were about thirty; my friend thought about twenty-five as they arose. He only saw them once. Will try and let you know more of them another fall. R.

GAME PROTECTION IN 1762.

MONTREAL, Can., *Jan. 5th,*

IN a recent number you published a copy of "One of the earliest Game Statutes enacted in America," being an act passed at a general court, held at Hartford, in 1698. I am not aware whether any legislation on this subject existed in Canada at such an early date or not, but to show that the question of game protection is by no means a new one, even in Canada, I send you a translation, from the French, of an ordinance issued at Montreal, the 23d of March, 1762. It is as follows:—

ORDINANCE CONCERNING PARTRIDGES,

BY HIS EXCELLENCE THOMAS GAGE, ETC.

To wit:—Having found it expedient, for the good of this colony, to allow the number of partridges (which is decreasing from day to day by the pursuit of them which is carried on during the pairing time) to multiply, we, in consequence, forbid all persons of whatever quality or condition they may be, to kill, cause to be killed, buy, or take in snares or nets any partridge between the 15th of the present month and the 15th of July of each year, under a penalty of a fine of 100 livres, one half to go to the informer, the other half to the poor of the parish in which they shall have been taken or killed.

We command that this shall be read, published, and posted in the usual places.

Done at Montreal the 23d of March, 1762.

(Signed) THOS. GAGE.

Another ordinance, published about the same time at Three Rivers, throws some light on that great question of "drumming," at least it shows that 118 years ago the "drumming" was supposed to be done by the partridge wings. Here is the translation:—

Placard (placart) which forbids the killing of partridges.

BY ORDER OF HIS EXCELLENCE, ETC.

Having been informed that between the 20th of March and the 15th of July, a great destruction of partridges takes place, notably at the time when they are pairing, from the facility with which they are killed, as they then make known the places in which they are by their drumming (*battement d'ailes*) and to prevent the continuation of this abuse, of which the inevitable result will be the entire destruction of these birds, a result which will deprive the public of one of the great enjoyments of life (*une grande douceur a la vie*).

We forbid all persons of whatever quality or condition of life they may be, to kill partridges between the 1st of April and the 1st of August, under the penalty of a fine of twenty piastres, payable to the informer, as well as to take them by nets or snares, or to remove their eggs under the penalty of a fine of double that above mentioned, applicable one-half to the informer, the other half to the parish in which they have been taken. And to remove all incentive, and desire that any one may have to kill them in the future during the space of time herein mentioned, we forbid all manner of persons, under the same penalty of a fine of twenty piastres to sell or buy them during the said time, to bring them into the city or other places within this government.

We command captains and officers of the militia, as well of this city as of the rest (*côtes*) of this Government to aid in the enforcement of the present ordinance which shall be read, published, and posted wherever it may be necessary in order that no one may be ignorant of it.

Given at Three Rivers, the 19th of March, 1762.

(Signed) R. BURTON.

It would be a good thing for the cause of game protection in the Province of Quebec if the Legislators of the present day had as enlightened views on the subject as those of 1762. H. R.

The Rifle.

CREEDMOOR'S RECORD FOR 1879.

THE REMINGTON SHOT GUN MATCH.—First Prize—A Remington double barrel breech-loading shot gun, presented by E. Remington & Sons, value $300. To be competed for twice each month during the months of July, August, September and October, 1879, and May and June, 1880, or until twelve competitions have been held. (In case of lapse of any advertised competition it shall not be counted as one of the twelve). At the close of the competitions the prize shall be awarded to that competitor who, having made two or more scores, shall have made the highest aggregate of two scores made by any one competitor in such competition; 15 per cent. of the entrance money to go to the highest score on each day; 10 per cent. of entrance money to go to second highest score on each day. Open to all members of the N. R. A.; entrance fee $2; rifle and position may; distances, 800, 900 and 1,000 yards; rounds 15 at each distance; competitors not to be coached in any way.

1st competition, July 19th—S. T. G. Dudley, Sharp Creedmoor; 800 yds., 66; 900 yds., 61; 1,000 yds., 61; total 188. 2d competition, Sept. 27th—Thos. Lamb, Rem. Creedmoor; 800 yds., 70; 900 yds., 68; 1,000 yds., 59: total 197. 3d competition, Oct. 15th—L. L. Allen, Sharp's Creedmoor; 800 yds, 72; 900 yds., 71; 1,000 yds., 66; total 209. 4th competition, Nov. 8th—L. L. Allen, Rem. Creedmoor; 800 yds., 72; 900 yds., 67; 1,000 yds., 64; total 203.

THIRD TURF, FIELD AND FARM CHALLENGE BADGE.—Presented by *Turf, Field and Farm* newspaper; open to all members N. R. A., except final winners of the two previous badges; distance 200 yards; position standing; weapon any breech-loading rifle within the rules; rounds 10, with privilege of two sighting shots; entrance fee 50 cents; to be won three times (not necessarily consecutive) before becoming the personal property of the winner:—

Date of Match.	*Winner.*	*Rifle.*	*Score.*
1—June 30th, 1877	W. H. Livermore	Sing.	42
2—July 28th, 1877	J. F. Rathyen	Bal. S.	44
3—Aug. 25th, 1877	A. Anderson	R. M.	42
4—Sept. 29th, 1877	Lewis Cass	R. M.	43
5—Oct. 9th, 1877	A. F. Finicle	S. C.	42
6—Nov. 17th, 1877	W. M. Farrow	Bal.	43
7—April 13th, 1878	J. R. Grohman	R. S.	40
8—May 4th, 1878	F. H. Holton	Bal.	42
9—June 8th, 1878	C. E. Blydenburgh	Bal.	45
10—July 20th, 1878	J. L. Paulding	S. C.	45
11—Aug. 24th, 1878	F. H. Holton	Bal.	44
12—Sept. 7th, 1878	G. L. Morse	Bal.	45
13—Oct. 5th, 1878	J. L. Paulding	S. C.	46
14—Nov. 23d, 1878	W. M. Farrow	Bal.	45
15—April 16th, 1879	W. M. Farrow	Bal.	47

EVERYBODY'S MATCH.—Open to everybody; entrance fee, 50 cents; re-entries allowed to extent of two; only highest score to count for a prize. Ninety Prizes match commences at 9 A.M. Pool targets open all day; distances, 200 and 500 yards; five shots at each distance; position, standing at 200; any rifle with head toward target, military rifles; any with other rifles at 500 yards; rifles, any. Those using other than N. Y. State pattern, Remington, or United States troops—who may be armed with Springfields will be allowed but four shots at 500 yards. Members of cavalry organizations will be permitted to compete under same conditions as are required of them to qualify for the N. Y. State Marksman's Badge, and members of the N. G. S. N. Y. may, with consent of their Inspectors of Rifle Practice, count their score made in this match as a qualification for the Marksman's Badge issued by the State; match shot Aug. 27th.

Lieut. J. C. Mallery, U. S. A., Springfield, 200 yds., 21; 500 yds. 23; total 44.

REMINGTON MATCH.—Prize of $300 in gold, offered by E. Remington & Sons (without recourse to the N. R. A.). Open to all comers; rifles, any Remington breech-loader within the rules of the N. R. A., to be loaded at the breech, with cartridges as furnished from the factory of E. Remington & Sons, which will be issued by the Superintendent of the Range to each competitor at the firing points, in sealed packages, at $1 for forty rounds; all shells to be returned. Distances, 800 and 1,000 yards; rounds, twenty at each distance; position, any without artificial rest. Highest aggregate in each competition to win. Ties to be decided according to the rules. No coaching, spotter nor exchanging or giving information allowed. No previous practice on day of match. No sighting shots. Entrance fee, $2. The prize must be won three times (not necessarily consecutive) before becoming the property of the winner. One-half of the entrance money in each competition to be divided; two-thirds being given to the highest score, and one-third to the second man.

1st competition, April 14th, 1877—J. L. Allen, 900 yds., 81; 1,000 yds., 78; total 159. 2d competition, May 19th, 1877—J. P. Waters, 900 yds., 68; 1,000 yds., 75; total 143. 3d competition, June 23d, 1877—H. S. Jewell, 900 yds., 71; 1,000 yds., 80; total 151. 4th competition, April 20th, 1878—J. L. Allen, 900 yds., 89; 1,000 yds., 91; total 180. 5th competition, Aug. 31st, 1878—F. H. Holton, 900 yds., 90; 1,000 yds., 96; total 186. Since which date the match has been placed on each monthly programme, but has always failed to get the requisite ten contestants.

BALLARD RIFLE MATCH.—First prize, a Ballard Mid-Range Rifle, offered by Messrs. Schoverling, Daly & Gales, No. 84 Chambers street, New York, value $60, and 20 per cent. of the entrance money; second prize, 15 per cent. of the entrance money; third prize, 10 per cent. of the entrance money; fourth prize, 5 per cent. of the entrance money; open to all comers; winners to be handicapped 1 point for each time won; distances, 100 and 200 yards; position, standing; weapon any rifle; rounds, 7 at each distance; no cleaning allowed between either shots or distances. The rifle to be won three times (not necessarily consecutive) before becoming personal property, but any competitor making a full score (35 points) at each distance at any one competition to become the final winner; entrance fee, 50 cents.

1st competition, May 7th—N. O. Donnell, Ballard; 100 yds., 34; 200 yds., 32; total 66. 2d competition, June 7th—F. Alder, Ballard; 100 yds., 33; 200 yds., 29; total 62. 3d competition, July 2d—A. H. Cobb, Ballard; 100 yds., 31; 200 yds., 30; total 61. 4th competition, Aug. 13th—M. M. Maltby, Sharp's sporting; 100 yds., 30; 200 yds., 31; total 61. 5th competition, Sept. 10th—E. P. Wells, Springfield; 100 yds., 34; 200 yds., 30; total 64. 6th competition, Oct. 11th—A. H. Cobb, Ballard; 100 yds., 31; 200 yds., 32; handicap 1; total 62. 7th competition, Nov. 7th—C. J. Falco, Ballard; 100 yds., 34; 200 yds., 30; total 64. Match still on.

WINCHESTER RIFLE MATCH.—Prize, a Winchester Repeating Rifle (new model, 75 grains), offered by Gen. Geo. W. Wingate; at the Running Deer Target; distance, 100 yards; deer to be run by signal from firing point; any rifle, but sights to be over the centre of the barrel, and no one shot to be allowed in each run; entrance fee, 25 cents, which will entitle the competitor to 4 runs; no limit to the number of times a competitor may enter, but no one to fire his second entry until all other competitors have fired their first; 10 cents fine for not firing, for firing while deer is out of bounds, or for hitting the haunch; fines to be paid before a second shot is fired; the highest score to take the rifle; the next to take 15 per cent. of the entrance money and fines; and the third 10 per cent.; the remainder being retained by the Association to cover the expenses of the match; the rifle to become the property of the competitor winning it three times (not necessarily consecutive).

1st competition, Oct. 27th, 1877—Geo. Waterman, Rem. Milt.; score 15. 2d competition, Nov. 14th, 1877—Geo. Waterman, Rem. Milt.; score 10. 3d competition, May 11th, 1878—W. R. Livermore, Springfield; score 11. 4th competition, W. M. Farrow, Ballard; score 13.

COWPERTHWAIT MATCH.—Prize, $50, or Trophy of equal value at the option of winner. Offered by Col. J. H. Cowperthwait, Assistant General Inspector of Rifle Practice S. N. Y. To be shot

Island, deer, ...ally, and to become the property of the competitor winning the net ...the greatest number of times during the season of 1879. with five of a tie the highest aggregate score of all competitions "finally" ...ipated in up to that time to decide. Open to all members of the ...N. G. S. N. Y. (in uniform); distance 400 yards; position standing or kneeling; rounds 10 for competitors using military rifles, 9 for all others; entrance fee 50 cents for each entry; competitors allowed two entries at each competition, but only the highest score to take a prize. Handicap—Winners of any first prize or place in any monthly or other match of the National Rifle Association shot at Creedmoor, 2 points. Four additional prizes will be awarded at each competition as follows: To the highest aggregate score, 20 per cent. of the entrance money; to the second highest aggregate score, 15 per cent.; to the third highest aggregate score, 10 per cent., and to the fourth highest aggregate score, 5 per cent.

1st competition, June 11th—C. H. Eagle, Rem. Milt.; score 47; handicap 2; total 45. 2d competition, July 16th—T. J. Dolan, Sharps Milt.; score 44; handicap 2; total 42. 3d competition, Aug. 9th—T. J. Dolan, Rem. Milt.; score 45; handicap 2; total 43. 4th competition, Sept. 27th—T. J. Dolan, Rem. Milt.; score 41; handicap 2; total 39.

CHAMPION MARKSMAN'S BADGE FOR 1879.—First Prize—A facsimile in gold of the Marksman's Badge, issued by the State of New York. Offered by Brigadier-General George W. Wingate, General Inspector of Rifle Practice S. N. Y., and 10 per cent of the entrance money. Second and Third Prizes—9 and 8 per cent. of the entrance money respectively, and to the next eleven 2 per cent. each. The Champion Marksman's Badge to become the property of that competitor who at the close of the season of 1879 shall have won it the greatest number of times. In case of a tie the highest aggregate score of all the competitions participated in up to that time to decide. The divisions of entrance money to be awarded at each competition; open to all members of N. R. A. and all members of the N. G. S. N. Y. in uniform jacket, cap, trousers and body-belt; distances 200 and 500 yards; 5 shots at each distance; weapon Remington rifle, New York State model; position, standing at 200—any, with head towards the target, at 500 yards; members of cavalry organizations will be permitted to compete in this match under the same conditions as are required of them to qualify for the N. Y. State Marksman's Badge; entrance fee 50 cents; competitors allowed two entries in each match, but only the highest score to take a prize; members of the National Guard may, with the consent of their Inspector of Rifle Practice, count their scores made in this match as a qualification for the Marksman's Badge issued by the State.

1st competition, April 19th—Priv. C. H. Eagle, 7th Regt., 200 yds., 22; 500 yds., 20; total 42. 2d competition, May 14th—Priv. C. M. Woodbury, 7th Regt., 200 yds., 20; 500 yds., 21; total 41. 3d competition, June 14th, Priv. C. H. Eagle, 7th Regt., 200 yds., 20; 300 yds., 24; total 44. 4th competition, July 9th, Sergt. N. B. Van Heusen, 12th Regt., 200 yds., 22; 500 yds., 23; total 45. 5th competition, Aug. 16th—Corp. F. C. Sewel, 7th Regt., 200 yds., 21; 500 yds., 23; total 44. 6th competition, Sept. 24th, Priv. W. W. J. Underwood, Jr., 7th Regt., 200 yds., 22; 500 yds., 24; total 41. 7th competition, Oct. 18th—Priv. H. B. Thomson, 7th Regt., 200 yds., 19; 500 yds., 24; total 43. 8th competition, Nov. 5th—Priv. J. R. B. Bayley, 47th Regt., 200 yds., 20; 500 yds., 19; total 39. Finally won by C. H. Eagle, 7th Regt., with two winnings for the season.

THE ALFORD MATCH—Twenty competitions (semi-monthly), for twenty Remington Military Rifles, N. Y. State model, .50 calibre, or U. S. Government pattern, .45 calibre. First prize, to the highest score in each competition, a Remington Military Rifle as above, value $18.50; second prize, to the second highest score in each competition (not the winner of the first prize), 15 per cent. of the entrance money in excess of $18; third prize, to the third highest score in each competition (not the winner of the first or second prizes), 10 per cent. of the entrance money in excess of $18. Open to members N. R. A., and to members N. G. S. N. Y., in uniform (jacket, cap, trousers and body belt). Distance, 200 yards; weapon, any military rifle; rounds, 10. Eighteen entries to constitute a match; entrance fee, $2 each entry. Two entries allowed, but only the highest score to take a prize. The same person can only win one military rifle. After twenty competitions the competitor who has made the highest number of competitions will be presented with a Remington Long-Range Creedmoor Rifle, value $100.

1st competition July 2d—Capt. J. L. Price, 7th Regt., Sharp's Milt.; score 41. 2d competition—Sergt. T. J. Dolan, 12th Regt., Rem. Mil.; score 44. 3d competition, Aug. 13th—Lieut. E. H. Griffin, U. S. A., Springfield rifle; score 45. 4th competition, Aug. 23d—Priv. W. J. Underwood, Jr., 7th Regt., Sharp's Mil.; score 44. Failed to fill during the remainder of the season.

"WE WILL." MATCH (FORMERLY NATIONAL GUARDSMAN MATCH.—Prize, a Remington Long-Range Rifle, value $125, offered by Major Charles A. Coffin. Open only to members of the National Guard of any State, in uniform (jacket, cap, trousers and body belt). Distances, 300 and 600 yards; position, at 300 yards, standing; 600 yards, any; 10 shots at each distance; weapon, any military rifle used in the organization of which the competitor is a member. Entrance fee, 50 cents. Prize to become property of competitor winning it three times (not necessarily consecutive).

1st competition, June 15th, 1878—Corp. J. W. Gardner, Rem. Milt.; 300 yds., 24; 600 yds. 25; total 49. 2d competition, Aug. 10th, 1878—Priv. C. H. Eagle, Rem. Milt.; 300 yds., 26; 600 yds. 23; 49. This match has failed to secure a single contest in 1879, though placed on each of the eight monthly programmes.

SKIRMISHER'S BADGE MATCH.—Offered by Gen. Hiram Duryea. Open to all members of the N. R. A., and members of the National Guard of any State in uniform (jacket, cap, trousers, and body belt). Weapon, the Military Rifle, issued to the Regular Army or Navy, or to the National Guard of any State, by the authorities thereof. Distances, from 500 to 200 yards as hereinafter prescribed. Second-class targets.

Competitors will be formed in squads of equal strength in rear of the 500 yards firing point, each squad opposite its target. At the order of the officer in charge of the match, the first man of each squad will place himself at his firing point and load. At the bugle-call, or other signal, each of these men will advance towards his target until a second signal is sounded, when he will halt, fire (assuming any position except lying on his back), rise to his feet and load. At the next signal, which will be sounded *thirty seconds* after the first, each competitor will again advance towards his target until another firing signal is given, when he will halt and fire as before. When the competitors have fired their fifth shot in advancing, they will face about and return over the course as "skirmishers," and these men will fire on signal as before. The practice will be repeated in this manner until all the members of each squad have fired. Five firing signals will be given while the competitors are passing from 500 to 200 yards, both in advancing and returning, at such distances as the officer in charge may see fit, the competitors estimating the distances and adjusting their sights accordingly. Five points will be deducted from the score of any competitor firing after a signal to advance has been given. The scorers will remain at the firing points with the remainder of the squad, but any competitor may designate some one to see that no error is made in recording his score.

Entrance fee, 50 cents. The highest score to take the badge, the next to take 15 per cent. of the entrance money, and the third 10 per cent., the remainder being retained by the Association to cover the expenses of the match. The badge to become the property of the competitor winning it three times (not necessarily consecutive).

1st competition, Oct. 27th, 1877—Priv. C. H. Eagle, Rem. Milt.; score in advance, 20; in retreat, 19; total 39. 2d competition, Nov. 14th, 1877—Sergt. James Ross, Rem. Milt.; advance, 21; retreat, 16; total 37. 3d competition, April 20th, 1878—Sergt. Joseph Ross, Rem. Milt.; advance, 14; retreat, 19; total 34. 4th competition, May 23d, 1878—Capt. W. C. Reddy, Rem. Milt.; advance, 17; retreat, 13; total 30. 5th competition, June 15th, 1878—Sergt. A. B. Van Heusen, Rem. Milt.; advance, 24; retreat, 15; total 39. 6th competition, July 13th—Capt. W. C. Reddy, Rem, Milt.; advance, 18; retreat, 18; total 36. 7th competition, Aug. 10th, 1878—Corp. F. C. McSewel, Rem. Milt.; advance, 21; retreat, 16; total 37; 8th competition, Sept. 14th, 1878—Capt. N. M. Kirby; advance, 23; retreat, 20; total 43. 9th competition, Oct. 9th, 1878—Priv. J. L. Paulding, Springfield; advance, 20. retreat, 21; total 41. 10th competition, Nov. 23d, 1878—Priv. C. H. Eagle, Rem. Milt.; advance, 16; retreat, 18; total 34. 11th competition, April 23d, 1879—Priv. J. L. Paulding; advance, 20; retreat 17; total 37. 12th competition, May 17th, 1879—Corp. F. C. McSewel Rem. Milt.; advance, 21; retreat, 17; total 38. 13th competition, June 18th, 1879—Sergt. A. B. Van Heusen, Rem. Milt.; advance, 24; retreat, 20; total 44. 14th competition, July 12th, 1879—Sergt. A. B. Van Heusen, Rem. Milt.: advance, 19; retreat, 22: total 41. Finally won by Sergt. A. B. Van Heusen, 13th Regt.

THE DIMOND MATCH.—First prize, a Trophy offered by Hon. James G. Dimond, value $75, and 20 per cent. of the entrance money; second, third, and fourth prizes, each 10 per cent. of the entrance money. The Trophy to be shot for monthly and to become the property of that competitor, who, at the close of the season of 1879, shall have won it the greatest number of times. In case of a tie, the highest aggregate score of all the competitions participated in up to that time to decide. The 20 and 10 per cent. divisions of entrance money to be awarded to the highest and second, third and fourth highest aggregate scores respectively in each competition. Open to all members of N. R. A., and all members of the N. G. S. N. Y. in uniform (jacket, cap, trousers, and body belt). Distances, 200 and 500 yards. Five shots at each distance. Weapon, Remington Rifle, N. Y. State model. Position, standing at 200; any, with head towards the target at 500 yards. Members of cavalry organizations will be permitted to compete in this match, under the same conditions as are required of them to qualify for the N. Y. State Marksman's Badge. Entrance fee, 50 cents. Competitors allowed two entries in each match, but only the highest score to take a prize; members of the National Guard may, with the consent of their Inspector of Rifle Practice, count their scores made in this match as a qualification for the Marksman Badge issued by the State.

1st competition, Apr. 30th—Priv. W. J. Underwood, Jr., 7th Regt., ; 200 yds., 19; 500 yds., 23; total 42. 2d competition, May 24th—Serg. A. B. Van Heusen, 12th Regt.; 200 yds., 21; 500 yds., 22; total 43. 3d competition, June 25th—Serg. T. J. Dolan, 12th Regt.; 200 yds., 22; 500 yds., 23; total 44. 4th competition, July 19th—Serg. A. B. Van Heusen, 12th Regt.; 200 yds., 22; 500 yds., 23; total 45. 5th competition, Aug. 6th—F. J. Donaldson, 200 yds., 21; 500 yds., 23; total 44. 6th competition, Sept. 13th—Lieut. M. T. Blakeley, 51st Regt.; 200 yds., 24; 500 yds., 21; total 45. 7th competition, Oct. 8th—Priv. E. W. Price, 7th Regt.; 200 yds., 21; 500 yds., 23; total 44. 8th competition, Nov. 1st—Priv. E. W. Price, 7th Regt.; 200 yds., 20; 500 yds., 21; total 41. Awarded to E. W. Price, having the best aggregate of 332, against 323 for Van Heusen.

HANDICAP MATCH.—Prize, $50 cash, or Trophy of equal value at option of winner, offered by Major James H. Jones, Secretary N. R. A.; to be shot for monthly, and to become the property of that competitor winning it the greatest number of times during the season of 1879; in case of a tie, aggregate score of each of all competitions participated in up to that time to decide; open to all comers; distance, 200 yards; position, standing; rounds, 10; entrance fee, 50 cents for each entry; competitors allowed 3 entries, but only the highest score to take a prize; any military rifle. Handicap—1. Rifles, other than regular military, 3 points; 2. Winners of any first prize or place in any monthly or other match of the National Rifle Association, shot at Creedmoor, 2 points. Additional prizes will be awarded at each competition as follows:—To the highest aggregate score, 20 per cent. of the entrance money; to the second highest aggregate score, 15 per cent.; to the third highest aggregate score, 10 per cent.; and to the fourth highest aggregate score, 5 per cent.

1st competition, Apr. 23d—A. J. Howlett, Ballard; score 43; handicap 3; total 40. 2d competition, May 31st—J. C. Mallery, Springfield; score 44. 3d competition, June 21st—A. M. Miller, Springfield; score 41. 4th competition, July 23d—P. J. Dolan, Rem. Milt.; score 44. 5th competition, Aug. 20th—B. H. Rogers, Springfield; score 44. 6th competition, Sept. 3d—H. R. Anderson, Springfield; score 43. 7th competition, Nov. 15th—J. C. Mallery, Springfield; score 42; handicap 2; total 40. Awarded to J. C. Mallery.

SECRETARY'S MATCH.—Prize, $50 cash, or Trophy of equal value at option of winner, offered by Major James H. Jones; to be shot for monthly, and to become the property of that competitor winning it the greatest number of times during the season of 1879; in case of a tie the highest aggregate score of all competitions participated in up to that time to decide; open to life and annual members of N. R. A. and active members of any regular military or naval organization in the United States; distances, 200 and 300 yards; position, standing at 200; at 500 yards, any without artificial rest (as allowed in N. R. A. regulations, governing position in any rifle competitions); weapon, any military rifle (excluding specials); rounds, 5 at each distance; entrance fee, 50 cents for each entry; competitors allowed 2 entries in each match, but only the highest score to take a prize. Four additional prizes will be awarded at each competition as follows:—To the highest aggregate score, 20 per cent. of the entrance money; to the second highest aggregate score, 15 per cent.; to the third highest aggregate score, 10 per cent.; and to the fourth highest aggregate score, 5 per cent.

1st competition, Apr. 26th—J. L. Price, Sharps Milt.; 200 yds., 20; 500 yds., 23; total 43. 2d competition, May 28th—C. H. Eagle, Rem. Milt.; 200 yds., 20; 500 yds. 24; total 44. 3d competition, June 28th—W. H. Cochrane, Jr., Sharps Milt.; 200 yds., 22; 500 yds., 23; total 45. 4th competition, July 26th—W. J. Underwood, Jr. Rem. Milt.; 200 yds., 20; 500 yds., 24; total 44. 5th competition, Aug. 30th—W. J. Underwood, Jr., Sharps Milt.; 200 yds., 23; 500 yds., 23; total 46. 6th competition, Sept. 6th—J. C. Anderson, Springfield; 200 yds., 23; 500 yds., 24; total 47. 7th competition, Oct. 22d—J. L. Price, Sharps Milt.; 200 yds., 23; 500 yds., 24; total 47. Awarded to J. L Price.

KENSINGTON RIFLE MATCH.—Prize, a Remington Creedmoor Rifle, value $100, offered by Messrs. E. Remington & Sons, 283 Broadway, New York. Open to members N. R. A. Distance, 200 yards; position, standing; rounds, 10; weapon, any; entrance fee, 50 cents. The rifle to become the property of that competitor winning it three times (not necessarily consecutive). The second, third, fourth, fifth, sixth and seventh highest scores in each competition to be awarded 10 per cent. of the entrance money. Handicap.—1. Any competitor using other than a "military" rifle, 4 points. 2. Competitors who have, in any N. R. A. monthly or other match at Creedmoor, made at 200 yards: (a). With a sporting rifle, 2 points over an average of centres (if using such a rifle in his match), 2 points; (b.) With a military rifle, over an average of centres (if using such a rifle), 2 points.

1st competition, May 31st—J. S. Case, Sharps Milt.; score 41. 2d competition, June 21st—J. L. Paulding, Rem. Milt.; score 41; handicap 2; total 39. 3d competition, July 23d—J. S. Case, Sharps Milt.; score 43; handicap 2; total 41. 4th competition, E. A. Griffin, Springfield; score 42; handicap 2; total 40. 5th competition, W. B. Gordon, Springfield; score 42. 6th competition, Oct. 1st—A. J. Howlett, Sharps Milt.; score 43; handicap 2; total 40. 7th competition, C. J. Falco, Peabody; score 40.

MASSACHUSETTS—*Hopkinton, Jan. 15th.*—The Rifle Club held a match at Claflin's Grove Saturday. The weather conditions were good. The wind was fish-tailed, shifting from 10 to 1 o'clock, but was easily handled. The match was 200 yards, off-hand, ten rounds :—

P. W. Smith	3	3	4	4	4	5	5	5	4	5—42

Boston, Jan. 17th.—To-day was a gala day at the Walnut Hill Range, the occasion being a friendly match between teams of ten men each of the Massachusetts Rifle Association and the Medford Amateur Rifle Club, and the regular competition in the regular meet of "everybody's match," under the auspices of the Massachusetts Rifle Association. The attendence was the largest that has been witnessed since the fall meeting, a large number of representatives of the leading rifle clubs of the State being present, and considerable interest prevailed among riflemen in the contest between the two clubs, as every one knew that they were about equally well matched in point of marksmanship. The weather conditions were of the finest. The winning club scored 445 out of a possible 500, or an average of 44.5, and the other 431, or an average of 43. Taking both teams together, they made an average of 43.8. Appended are the scores of the contesting clubs :—

MASSACHUSETTS TEAM.

W. H. Jackson	5	4	5	5	4	5	5	4	5	5—47

E. Whittier	4	3	4	3	4	3	4	4	4	4—37
Total										431

The fact that the range has been paid for, together with the reduction of price in the entries, seemed to have inspired members with increased interest in the regular Saturday meet, and the records of the score-keepers in "everybody's match" show that one hundred and forty persons participated. Appended are the best scores :—

W. H. Jackson	5	5	5	4	5	5	4	5	5	5—48

BOSTON MAMMOTH RIFLE GALLERY.—The New Year Rifle Match, with its eight cash prizes, has filled the gallery day and evening with representatives of the several rifle clubs. The following is the standing of the several competitors to date; three scores to count as one continuous score; in case of a tie, to be decided on the excellence of each score, 150 feet; rounds, 8; possible 40 :—

				Total.

—Secretary F. J. Donaldson has set apart Tuesday and Thursday afternoons, from 1 to 3 o'clock, for attendance at the rooms of the National Rifle Association. He will be happy to see all the members and others at these hours, and confer with them on rifle-shooting matters.

NEW JERSEY—*Newark.*—The riflemen here are a busy lot, and at present a dozen rifle clubs are in existence in this city as follows: Newark, Amateur, Barnard, Prelinghuysen, Washington, Plymouth, Sterling, Essex, Niagara, Catholic Institute, Joe Hooker, Enos Runyon.

Of the galleries in the city the oldest and probably best known to the general public is at No. 554 Broad street, and is now kept by Mr. Hill. This range was built in 1869 by A. B. Kay & Co., and in its early days was the resort of all who enjoyed rifle shooting. From ten to twenty thousand cartridges a month were used. Since then an entirely new gallery on an ingenious principle has replaced the old one. The target is placed on a carriage, which is moved on rails up and down the range. The distance is eighty-five feet.

Montgomery's range in Clinton street is one of the newest. It is the headquarters of the Newark Amateur Club and the resort of the Association.

At the corner of Broad and Clay streets Mr. Van Volkenburg has erected a double gallery with a range of 100

feet, and Mr. Von proposes to build an extension, which will make a commodious supper and meeting room.

Huegel's range, the headquarters of the Essex Club, is situated at the corner of Bank and Rutgers streets.

John Bauer's well known gallery at No. 120 Market street has been in existence five or six years, and has been patronized by all the small-bore shots in the city. The Washington Club now make it their range, and shoot regularly every week.

The shooting at Pettigrove's gallery, No. 64 Market street, is conducted through an iron cylinder about 75 feet in length and a foot in diameter.

The Plymouth Club make No. 35 William street their headquarters.

The targets used by the clubs in this city are uniform in size, and are reproductions of the regular Creedmoor pattern on a reduced scale. The favorite rifle appears to be the Ballard, although Wesson's and the others are all to be found. The favorite cartridges at present are Winchester's, and 22-100 is the size generally used. Most of the matches are shot with globe sights, although there are a few members of clubs who adhere to the open or sporting sight still, and do very good work with it.

Among the prominent rifle shots in this city Will Hayes undoubtedly occupies the highest position, as he does everywhere he goes, and few men in the country have a record which in any way approaches his up to 200 yards range and at any kind of target. He can conceal himself behind the badges, medals and prizes he has won. Mr. W. C. Gardiner, the president of the Association, is also an extraordinary marksman, and a few others of note are Wm. P. McLeod, J. L. Tobin, Victor Hesse, Gus Freche, Mich. Walsh, John Bauer, J. F. Hill, John and James Doon, E. E. Starrs, R. P. Conlan, Ed. Denin, M. Rache, A. T. Parker, Wm. Reginald Huntington, Wm. H. Egbert, Geo. Wiegmann, Aug. Lang, J. L. Sommers, P. L. Sommers, Geo. Townsend, Wm. Betzwick, Chas. Baldwin, A. C. Neumann, and a score more.

Game Bag and Gun.

GAME IN SEASON IN JANUARY.

Hares, brown and gray. Wild duck, geese, brant, etc.

FOR FLORIDA.

Deer, Wild Turkey, Woodcock, Quail, Snipe, Ducks, and Wild Fowl.

"Bay birds" generally, including various species of plover, sand piper, snipe, curlew, oyster-catcher, surf birds, phalaropes, avocets, etc., coming under the group *Limicolæ* or Shore Birds.

GAME AND FISH DIRECTORY.

In sending reports for the FOREST AND STREAM Directory to Game and Fish Resorts, our correspondents are requested to give the following particulars, with such other information as they may deem of value: State, Town, County; means of access; Hotel and other accommodations; Game and its Season; Fish and its Season: Boats, Guides, etc.; Name of person to address; after the following model:—

NEW JERSEY.—*Parked River*, Ocean Co.—Reached via New Jersey Southern Railroad; time, 3½ hours from New York City. Riverside House, A. H. Corwin; $2 per day, $8 to $10 per week. Open all the year. Superior accommodations for families. Has a billiard-room, no bar. *Game.*—Ducks, geese and brant, from Nov 1st to May 1st; bay birds after July 1st; quail and Wilson's snipe, Nov. 1st to Feb. 1st; woodcock after July 3d. *Fish.*—Bluefish, June 1st to Nov. 1st, weak fish, sea bass, king fish and sheepshead, all summer. Guides, with dog, $1.50 per day. Boat, with man, decoys, etc., $2 and $3 per day. Address as above. Further particulars and photograph of place can be seen at office of Smith & Lawrence, 44 West Broadway, New York.

—The clearance sale of Messrs. J. Palmer O'Neil & Co., advertised elsewhere, should receive the attention of all who are looking for good guns at low figures. This firm has attained an excellent reputation for square dealing, and we take great pleasure in bringing their sale to the notice of our readers. Among the makers advertised are the standard names, whose trade-mark on a gun is sufficient guaranty of its excellence.

FINE BREECH-LOADING GUNS.—Messrs. W. & C. Scott & Sons have recently brought out a line of guns known as and branded "Special Grade," which are designed to meet a want long felt by sportsmen, for a gun of this celebrated make at a reasonable figure. They are of the most improved workmanship, and combine the improvements of their celebrated top-action and double bolt rebounding locks, pistol grip, patent fore-end snap, large plungers, and choke-bored if desired. They are made with Damascus barrels, and particular care is taken to make them strong and close-shooting guns. We believe Messrs. Hartley & Graham, of New York, are sole agents for this grade of gun, and at this establishment will be found a large assortment of sizes and weights. We understand they are sold at about $80.00.

THE PHŒNIX CLUB.—The annual meeting of the Phœnix Club of Seneca Falls, N. Y., was held last Thursday evening at the rooms of the Club, corner of Fall and State streets. The business of the evening was the election of officers, the ticket being as follows: President, Angus Compson; Vice-President, Ed. M. Rumsey; Secretary, W. B. Harper; Treasurer, T. R. Lawrence; Executive Committee, W. S. Murray, Chas. Chamberlain and Wm. N. Preston.

Then followed a banquet, the excellence of the informal speeches and the flow of soul being characteristic of the Phœnix boys. There were several visitors from out of town, and it is needless to say that they carried home with them the liveliest report of the Club's courtesy. Among the attractions of the club-rooms, in the shape of a large variety of stuffed birds which adorn the walls, and also in cases, are a wood ibis and a blue heron, natives of Florida, the gift of Greene Smith, of Peterboro, ex-President of the State Sportsmen's Association, who has shown his friendship for the Club in various ways. The Club was organized nearly ten years ago with fifteen members; they now have eighty members in good standing. They have sent a full delegation to every State convention since their organization, and their reputation as marksmen is second to no club in the State. A large number of new and efficient members have recently been added.

AN EARLY MORNING CONCERT.—The following witty description of what was heard one morning on the ducking grounds, forms part of a private letter written from "Ecarté Lodge," on the outlet of the River St. Clair, Canada, apprising the recipient of the prospects of sport. It was not intended for publication, but we have been permitted to read it, and, liking it so much, to publish it here for the appreciation of our readers. The letter is cherished by its possessor as a memento of his friend. With the humor of its fancy is blended the sadness and regret which steal over us, when we recall the bright days of the past and the companions who are removed from our presence on earth forevermore:—

ECARTE LODGE,
Outlet of the River St. Clair, Canada.

'Twixt sleeping and waking this morning, I heard, or seemed to hear, sweet strains of music. The voices seemed familiar to me, and I listened in beatific wonderment until the end, when I ventured in a few remarks to render grateful homage to all who had contributed to my enjoyment. The following was the programme:—

RECITATIVE.—"Here We Are Again."..... Mr. Wild Goose.
ARIA.—"Spare Us We Pray,"..... Mrs. Gray Duck.
QUARTETTE.—"Hurrah for Spring."....Messrs. W—r, W—s, O'H—a, and J—n.
With Breech-Loading Accompaniment.
SONG.—"Oh, Were I but a Mud Hen."..... Mr. Redhead.
TRIO.—"They Cannot Kill the Whole of Us"...Messrs. Redhead, Bluebill, and Widgeon.
SENTIMENT.—"Bill W—s Can't Shoot Worth a Cent."... Mr. Razor Sharp.
GRAND CHORUS.—"The Quack-Bang."..... By all the performers.

REMARKS.—The Concert on the whole was an admirable one, but the recitation by Mr. Wild Goose was somewhat harshly delivered, and we would venture to advise him to study the modulation of his voice in other climes, lest he himself should some day fall as flat upon the water as his delivery did upon his audience this morning. Mrs. Gray Duck, an old favorite, was rapturously applauded, the whole audience cheering her again and again. The quartette did not seem to meet with much favor; several lady Redheads rose to leave, saying the noise was too much for them, but after a little coaxing were prevailed upon to stay. The song by Mr. Redhead was received with murmurs, some Redheads saying they preferred death before dishonor. An inebriated Bluebill was here turned out, for loudly exclaiming that he would as soon be a Redhead as a mud hen when W——r was around. The trio was apparently very popular; a comfortable rustling of their wings betokening satisfaction on the part of the assembled thousands.

The "Sentiment" by Razor Sharp was the hit of the morning. Delivered in a sepulchral voice, it fairly convulsed the meeting; nor did the hilarity cease when a little Butter-ball, with his wing in a sling, said, in a squeaking voice, "That's so." The "Chorus" was a grand success, and it was universally resolved that a series of these concerts should be given throughout the spring.

MASSACHUSETTS—*Pittsfield, Jan. 19th.*—White hares are very plentiful with us this winter. A friend and myself killed fifteen in front of one hound in little less than half a day. F. C. B.

NEW YORK—*Hornellsville, Jan. 19th.*—There have been shot in this place since Nov. 1st at least 400 red foxes. Tuesday last S. B. Amidon shot three; he has averaged four a week since Nov. 1st; used only one dog, a half-bred fox-hound. J. O. T.

NEW JERSEY—*Ocean Co., Jan. 12th.*—We are having very warm weather, with no ice, so the ducks remain, and good shooting has been done the past week in some of the small bays, especially Musquito Cove; why so named, all can find out by coming here to shoot bay birds, as it is also a great place for yellow legs. The best bag of the week, to my knowledge, was thirty-two red-heads to one stand. The only ducks now here are red-heads, broad-bills and widgeon. The numerous other small ducks have gone south. Robins winter here in immense flocks, and larks also remain all the year round. S. K., JR.

Jan. 19th.—Since my last we have had some ice, but only enough to stop the shooting for one day. Thermometer was down to 15 deg., the coldest of the season. But the ducks are still here in thousands, more than have been seen before since the memory of the oldest inhabitant. Reports from the South say the ducks are very scarce there. The abundance of them in all our Northern waters may account for it. Many large bags of red-heads were taken this week, from sixteen to twenty-four to a stand for the three days' gunning which is allowed, Monday, Wednesday and Friday, in Musquito Cove. Should this weather continue we shall expect the snipe to return by the 1st of March. S. K., JR.

VIRGINIA—*Clifton Forge, Jan. 17th.*—Game of all kinds has been more plentiful here during the past season than usual, especially bear and turkey. The writer assisted in killing twenty deer, five turkeys, numerous pheasants, and severely wounding a large bear, which got off in the thick laurel. Our best time for bear is yet to come, viz.: when the ground is covered with snow. T. R. G.

TENNESSEE—*Nashville, Jan. 14th.*—Until the last two days the weather has been so warm that little or no game has been brought to market, although the woods and fields are filled with quails, rabbits and squirrels. In the wilder portions of the State and in the mountains deer and wild turkeys are quite abundant, and a stray bruin is occasionally met with. Foxes are very plentiful. The great hunt that was being organized for Christmas failed on account of the weather and a grand ev... family of the overseer, which has been hanging over two months and not yet come off. Although th... of the hunter is a popular musical instrument, no Nim... has yet written a score that would suit it to accompa... the squalls and yelps of a new born. Business is so active here at present, and money is being made so generally, that next year we may look forward to some grand sporting organizations; they will provide themselves with regular camp equipages, and take to the forest in grand style. Then the FOREST AND STREAM'S correspondent will be able to make at least a part of the two columns devoted to fishing and the game bag at least readable, with the exploits of these gentlemen. J. D. H.

A FINE QUAIL COUNTRY.—Messrs. E. and M. A. Malley, of New Haven, Conn., W. Fitzgerald, of Bridgeport, and Dayton, of Northford, are located at High Point, North Carolina, where they report excellent quail and woodcock shooting. The sport is fine between Greensboro', Thomasville, and Charlotte. Orders for live quail may be forwarded to them through Mr. James Malley, New Haven, Conn.

OFF FOR FLORIDA.—Mr. William Dehon King and his brother, Mr. David King, of Newport, R. I., passed through the city on the 20th inst., on their way to Florida, where they intend spending six weeks in shooting quail and wild fowl. They had with them eight live mallard duck decoys. This is the first instance we have ever known of live decoys being taken to Florida.

OHIO—*Oxford, Jan.* 12th.—Quail are scarce, although we think there is a pretty good breeding stock for next summer. Rabbits scarce; squirrels more plenty than for years. We hope to have fine sport after them in the spring. We are not in the line of the great flyaway for ducks and geese, therefore can only enjoy the descriptions of those that have a chance at that best of all sport, and try to make up for our hard lot by reading the FOREST AND STREAM. M. S. I.

OREGON—*Corvallis, Dec.* 28th.—In July and August we have fine shooting; the young grouse and pheasants are very plentiful and furnish fine sport. Quail are also plenty of the kind known here as the "California quail," and the various gun clubs are introducing our old familiar Bob-White, which do well and increase rapidly. Our own club at this place is yet in its infancy, but have already contracted for a supply of these beautiful game birds, and in another year we hope to hear the old familiar cry or whistle, "Bob White." We will make sportsmen truly welcome to the "Web-foot State," and think they will never regret the time spent here. Our sport here now is confined mostly to duck shooting, which has been good all winter, with occasionally a deer-hunt on the hills, where they may be found any time by going after them. W. B.

SPORT IN MEXICO.—*City of Mexico, Dec.* 23*d*, 1879.—*Editor Forest and Stream:*—Since I last wrote you I have been fortunate in having more time to devote to my collection than previously. I have pretty thoroughly explored the country east, northeast, and southeast from this city for a distance of two miles, and have found about thirty-five specimens of birds. Strange to say, five-sixths of this number are of the Rocky Mountain fauna, of the United States. Owing to the scarcity of trees in the localities I have visited, birds whose habits are strictly arboreal are either wanting entirely or very rare; of flycatchers I have only found one, and of warblers, three. Thrushes are things I have not met with, at which I am rather surprised, for in many places the country is admirably adapted for their presence. Early as it is, several birds are pairing, among which I recognize the shore larks, swallows, and some of the sparrows.

One great difficulty in collecting here, is, that one must keep near the city, otherwise the Indians have no scruples about relieving a person of whatever he may have. They are very suspicious as it is, and every time I take a walk without the city walls numerous eyes follow my every move.

As to game, I would say, ducks are very numerous; the lakes are fairly black with them, and at early morn and late in the evening large flocks may be seen flying to or from their feeding grounds. In addition to the teal, of which I spoke in my last letter, I observe quite a number of red heads. Quail are unknown in this valley, but are found in large numbers in the *Tierra Calientes*, or Hot Grounds, about fifty miles to the southwest. Rabbits also are not found here, but are quite plenty within a couple of hours' ride by rail. Snipe, I understand, are to be found in large numbers in the swamps near Tacuka, a place about five miles out of the city. Deer are plenty in the mountains about ten miles off, and may be found here any day in market. About thirty miles to the southward, pumas, or mountain lions, as they are called in the west, are quite plenty. The most of the hunting here is done by the Indians, though there are enough foreigners to have good sport when they desire. A. W. B.

THE GREAT OKEFENOKEE.

FLORIDA, *Jan. 2d*, 1880.

ACQUAINTED for some winters past with the ordinary tourist's route to and through Florida, embracing the Peninsula, from sea to Gulf, my attention was almost accidentally called to the St. Mary's River and the region of the Okefenokee as a hunting ground. The result of a more intimate acquaintance with this beautiful region, not only bore out the truth of the information received, but makes me desirous of imparting it to all the readers of the FOREST AND STREAM.

The Okefenokee is one of the most remarkable swamps on the continent. It can be easily reached from St. Mary's, or Fernandina, on an excellent little mail steamer under the command of Captain Jno. Richardson, whom many will remember, a year or two since, as one of the most popular captains on the St. John's River. The boat leaves St. Mary's and Fernandina twice a week, making the trip in about seven hours.

The run up the St. Mary's is charming, and alone affords more sport than the St. John's and Ocklawaha, where drawing a bead on the most tempting alligator or dainty duck is now strictly forbidden, and the prohibition is enforced, especially since the sad accident on the Ocklawaha, which resulted in the death of a lady passenger here.

In the neighborhood of St. Mary's, on Cumberland

Island, deer, bear, and all kinds of game abound, while the net-work of salt water rivers and inlets are covered with flocks of the finest duck, and swarm with the "finny" of every tribe, from the gorgeous snappers to the dainty trout. During the delightful excursion from St. Mary's to Trader's Hill, dozens of alligators may be seen sunning themselves on the warm banks, affording splendid sport for the rifle and revolver, and from that point the tourists can explore and the huntsman enjoy the wonders of the great Okefenokee.

This marvellous region is the summit level of the great canal designed by Government to furnish an outlet for all the products of the Mississippi Valley and the great West to the Atlantic coast at St. Marys, and it literally teems with game of all kinds, almost unaccustomed to the crack of a rifle. Vast flocks of duck frequent its sheltered pools, while trout from five pounds to seven pounds are numerous in its placid meres. Herds of deer roam through its virgin forests; nimble squirrels by the thousands leap from the moss-grown oaks; wild turkeys in large numbers abound, and offer splendid sport; bear and wild-cat add a wholesome zest to the keenest enjoyment; while "the roar of the grim alligator" challenges the enthusiastic hunter, as it reverberates through these vast solitudes.

A recent survey of this wonderful swamp, covered with some of the noblest forest timber in the Union, interspersed with lakes and teeming with all kinds of game, gives the extent of it as over seven hundred square miles; and speaking of the presence of the alligator in great numbers, states that on one occasion the members of the survey counted a herd of over four hundred of these mighty saurians in one of its lakes.

In conclusion, let me recommend all lovers of good sport to halt at St. Mary's; by going further they will fare worse. There, one of the best, most comfortable and reasonable hotels in the South (kept by Mr. Thompson, proprietor of the popular Kearsage House, White Mountains), affords an excellent *pied a terse* to carry on the campaign, whether on land or sea. The great Red Snapper Banks are in sight of the St. Mary's bar. Neither the St. Johns, Ocklawaha nor Indian Rivers can afford them anything like the alligator shooting on the St. Mary's. I should like to try the effect of explosive cartridges on those "small deer." One monster measuring from sixteen to eighteen feet, attacked by three of us within three miles of St. Marys, took fourteen balls at a ten-feet range, point blank, down his throat and through (?) his sides, and yet escaped. The Okefenokee, so easy of access from St. Marys, offers a perfect El Dorado for the sportsman, winter and summer alike.

PIONEER.

TRAPPING FOXES IN WATER.—It is not often that trappers are willing to disclose the methods practiced for the capture of foxes. Such things are trade secrets:—

Select warm living springs that keep open in winter, in places sheltered from drifting snow, and where they do not receive much surface water during heavy rains and thaws. Those with soft muddy bottoms are best. Set the trap with the springs at right angles to the jaws, and when placed, the springs to be opposite the shore, the loose jaw being parallel with it a couple of inches distant. The shore should be a firm level sod or flat stone, and on a level with the cover of the pan. The trap should rest firmly, the surface of it half an inch below the water. For a cover cut a slice of well-rooted sod an inch thick, and of size and shape of the space inside the jaws, with a little spare room, so that the jaws may not be clogged by it in springing. Shave the sod on the under side from the centre down to a thin edge on the outside, so that it may be shaped oval on the top side, the edges reaching to and a little under the water. A weight of two or three pounds should be attached to the end of the chain, to prevent the game going too far, yet not enough to hold him where he is caught, as he would thus get befouled with mud, besides making repairs necessary for resetting. With such a clog the trail is easy to follow. The chain should rest under water, and all parts not hidden by the sod should be well covered from sight with soft mud. The bait is to be placed six or eight inches beyond the trap and partly above the water, taking care that there are no stepping stones on which to reach the bait except the cover of the trap. To complete the job dash water over every part that has been touched, leaving the spring by the outlet for a couple of rods, and afterwards approach the trap to reset in the same way. The above is a correct description of the method; but of course there are niceties and details that enhance success, requiring too much space to describe, but which will be learned by practice. But this much may be added: leave all the surroundings looking as natural as if they had grown so, and leave no human scent.

CORPL. LOT WARFIELD.

SHOOTING MATCHES.

MINER GUN CLUB.—Pigeon shoot at the club grounds, Springfield, L. I., Thursday, Jan. 15th. Double trap, 25 yards rise:—

Harry Miner	1	0	1	1	1	1	1	0	1	1—8
G. Ary	0	1	0	1	0	1	1	1	1	1—7
J. Wood	1	0	1	1	0	1	1	1	1	1—8
J. Davis	1	1	0	1	1	1	1	1	0	0—7
W. Sterns	0	0	0	1	1	1	0	0	1	0—4
M. Englet	0	1	0	1	1	1	1	1	1	1—8
P. Hoffman	0	0	1	1	1	1	1	1	0	1—7

HIGHLAND GUN CLUB.—*Peekskill, N. Y., Jan. 16th.*—Handicap pigeon match. Most of the members are amateurs:—

	Yards rise.										*Killed.*
A. R. Free	25	1	1	1	0	0	1	1	1	1	0—7
B. F. Ferris	23	0	1	1	0	1	1	0	1	1	1—7
H. B. Wygant	23	1	0	0	1	0	1	1	1	0	1—7
George Wygant	21	1	0	0	w						—1
R. Valentine	21	0	1	0	1	1	1	0	0	1	—5
B. Kittredge	25	1	1	1	0	1	1	0	1	1	—7

H. B. W.

Rochester, Jan. 17th.—Scores of the only general pigeon shoot that has taken place in this city since the State shoot in July. The attendance was good and the sportsmen entered with zest into the sport. Representatives from Syracuse, Rome, Genesee and other towns were present, and the day passed pleasantly.

The first match was a sweepstakes, with the following entries:—

Hudson	4	Miller	2
Young	4	Arnold	2
Smith	1	Green	4
Crouch	4	Hoag	4
Stearns	3	Niven	4
Hooker	6		

The first prize was divided; Ed. Hudson won the second and M. A. Stearns put third in his pocket.

The principal contest came next in order—$10, $5. The score was:—

Hooker	8	Mattison	7
Forsythe	6	Jeffreys	7
Young	9	Babcock	9
Hudson	10	Crouch	9
Green	8	Talzor	6
Hale	6	Shaw	8
Warner	9	Andrews	10
Hoag	9	Weighell	8
Griswold	4	Dann	7
Stearns	7	Chaffey	5
Niven	8	Brown	6
Briggs	7	Aikenhead	9
Miller	8		

Ed. Hudson and I. H. Andrews divided the first prize, Milton Hoag took care of the second, I. Weighel of the third, and M. A. Stearns fourth.

A third contest at five birds took place, with the following result:—

Weighell	3	Greene	4
Hudson	5	Hale	4
Crouch	4	Coates	4
Young	4	Griswold	3
Miller	3	Aikenhead	3
Stearns	4	Hoar	5
Hooker	5	Niver	2
Walzer	4	Murray	3
Forsythe	3	Redmond	4

The first prize was divided between those killing their birds, the second was won by Miller, and the third by Forsythe.

The contests for prizes closed with a "freeze out," in which Miller kept from freezing to the last, and won. The entries were: Griswold, Hooker, Crouch, Hale, Miller, Hoag, Walzer, Stearns, Murray, Stewart, Jones and Niven.

RARITAN SHOOTING CLUB.—*Keyport, N. J., Jan. 19th.*—Match for gold badge, 15 balls; 18 yards rise; revolving trap:

G. Waites	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1—15
W. Homes	1	0	1	0	1	1	1	0	0	1	1	1	0	1	0—9
F. Brower	1	0	1	1	0	1	1	1	0	1	1	0	0	0	0—8
S. Lamberson	1	1	1	1	1	1	1	0	1	1	1	1	1	0	1—13
J. Ivins	0	0	1	1	1	1	1	1	1	1	1	1	1	0	0—11
R. Nowden	0	0	1	1	1	1	0	1	1	1	1	1	0	0	0—9
G. Waits	1	0	1	1	1	1	0	0	1	1	1	1	1	1	1—11
G. Warner	1	1	0	0	0	0	1	0	0	1	0	0	1	0	1—6
G. Marer	0	1	0	1	0	1	1	1	0	0	1	1	1	1	1—10
O. Carhart	0	1	1	1	1	1	1	1	1	1	0	1	1	1	1—13
J. Mayer	1	0	1	0	0	0	0	0	1	1	1	0	1	0	0—6
W. Curtis	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1—15

Ties shot off at 5 balls:—

G. Waits	11111, 11111, 11111, 11100	18
W. Curtis	11111, 11111, 11111, 11110	19

Waits broke 33 out of 35; Curtis broke 34 out of 35.

OHIO.—*Nelsonville, Jan. 17th.*—Match between Shawnee and Straitsville for $60 a side; ground trap; Ohio rules:—

Straitsville.		*Shawnee.*	
H. Matthews	1 0 1 1 0 1 1—5	R. Peart	1 0 0 1 1 1 1—5

J. McGary	1 1 0 0 1 1 1—5	G. Shields	0 1 1 1 0 0 1—4
Total	20	Total	19

Yachting and Boating.

☞ *Sixteen clubs have already joined in the movement looking to the establishment of a National Yachting Association, and others are yet to be heard from. All clubs which have the interests of the sport at heart should send in the names of their delegates, pursuant to the call issued, to the Secretary, Mr. John Frick, P. O. Box 2,070, New York. The first general meeting will be held towards the latter part of February.*

NEW YORK YACHT CLUB.

SO deep is the interest felt in all that concerns the doings and prospects of the leading yacht club of America, not only by yachtsmen, but by the general public of the metropolis and environs as well, that some reflections concerning certain proposed changes of routine will not be amiss at the present time. A meeting of the New York Yacht Club is to be held February 5th, at their club rooms, when we believe a move will be made by quite a number of members looking to the abolishing of the time-honored custom of match sailing in June, with a view to turning the funds thus saved to account of the annual cruise in August.

The reasons advanced for such a radical and, it must be confessed, somewhat heretical change of programme, do not seem very clear, nor can they be considered as balancing the other side of the scales when the question is closely scanned. In general, an impetus was given to the idea through the comparison of the modest list of entries in the annual June matches, or "regattas," as the club still calls them, with the noble fleet which obeyed the Vice-Commodore's call in the August cruise of the year just closed. For the matches the entries numbered thirteen, and for the cruise something over thirty vessels gathered under the ample broadside of the big *Rambler*. Naturally enough, after one of the most successful cruise, undertaken by any club at home or abroad, a strong undercurrent was met, and outspoken advocates of a new and rather bold step came to the surface. Why not abolish the June "regatta" altogether, save the funds and charter a big steamer to cruise along with the squadron up the Sound with guests of the club on board?

The plan looks feasible enough at first, but will hardly hold water when put to the test. In the first place, we assume it is only upon the supposition that the club funds would thereby be put to a better or more advantageous use, that the annual races of the club are to be abandoned altogether and the cruising steamer attached to the squadron instead. But upon investigation it will be seen that no such exchange can be made, as the balance sheet of the club is just about even at the end of the year with the present expenditure of the funds. Should the projected "cruising steamer" be attached as an item of the debit account, the club will be out of pocket to the tune of several thousand dollars, an aspect of affairs not over agreeable to contemplate, even for those members most interested in bringing about the change. This is about the story figures have to tell:

Total expenses of June matches, not to be particular about the odd cents involved	$2,404
Cruising steamer, 15 days, say	$3,000
Music, tickets, wharfage, etc	404
Guests (100). 4,500 covers	3,000
Total	$6,404
Excess cruising steamer over races	$4,000

Certainly a neat little floating debt, even for a club whose annual income reaches $9,943. But in this account figures have been based upon more moderate demands than altogether agreeable to many of the probable guests of the club. Thus music has been confined to a hand-organ, with harp and fiddle, by itinerant artists from sunny Italy, whose strains would become monotonous before the cruise winds up, even if they did not drive all hands to seek an untimely watery grave. Again, frugality has been studied in the item of $4,500, meals, and liberal discount has been deducted for those long-shore tars of the sterner sex and the delicate maidens among the weaker who would find it convenient to abstain from joining at the festive board out of regard for the proper harmony of affairs. Finally, it is an open question whether a suitable steamer (she must have sleeping cabins) can be had for the sum indicated during the height of the season. So much for the expenses, should the idea be to offer the cruise free to guests of the club.

If, on the contrary, it is proposed to issue tickets to members, to be disposed of by them to their friends at a figure sufficient to cover "board and lodging," the expenses will be overcome by 100 guests at $60 *a person!* And where can the N. Y. Y. C. find a hundred $60 enthusiasts of the kind? Or keeping in view only the excess of $4,000 over and above the expenses of the June racing, where are the one hundred $40 martyrs to come from, to put up in resignation with the sweltering cabins and berths, 6 ft. by 2, and musty linen and confinement and sea-sickness and the like, to say nothing of the real danger in even moderately rough water to one of our side-wheel river boats, the danger of topheaviness in a breeze, and the chances of wreck when struck by a sea under the guards, or of doubling up like a jack-knife in the short lumps to be met with about Judith and the Vineyard towards the closing days of August? Really, to pay $60 or $40 for the privilege of undergoing the mild, slow torture such a trip would entail, would be an excess of self-sacrifice with which we are not prepared to credit any considerable body of the public; least of all the gentle guests of the N. Y. Y. C. Your regular tar will ship aboard one of the yachts as an extra hand in the cabin; your tame landsmen is not likely to be wrought up to that pitch of enthusiasm for the cause as a $60 ticket and fifteen days of the harrowing and desperate hardship of a two weeks' cruise on a common steamboat would seem to entail.

Probably the members interested in carrying through the innovation of a cruising steamer—a sort of family appendage to the squadron—have their own views to advance, and should be heard from before final judgment is given, but we must confess the whole scheme appears chimerical.

On the opposing side, however, some valid objections can be raised. The additional expense with no adequate provision to cover it; the possible failure of guests to appear in the desired number; the undoubted *loss in prestige* of a club which confesses itself unable to bring to the line entries enough to make it worth while providing prizes for its annual matches; the greater affinity its racing members would rapidly exhibit for some of its more enterprising rivals; driving new yachts into other clubs to get their racing, which otherwise would gravitate to the N. Y. Y. C.; the questionable advantage of turning a cruise intended to promote seamanship into a mere excursion, or a sort of variety performance, and the general impracticability of the whole "cruising steamer" plan. It will be difficult, we think, to set aside such weighty reasons for the perpetuation of the June races for all time to come just as in the past.

It is wide of the mark, moreover, to regard the annual races as a failure in any sense of the word. The average entries back to 1845 have been more than satisfactory. Out of a total of thirty-four races only five were deferred; two owing to "too much" wind, and only three owing to want of wind. The average number of starters from 1845 to 1879 was thirteen, excluding international races for America Cup, and the year 1861, during which the usual regatta was omitted in consequence of the war. For the last five years the number of starters averaged sixteen, showing that racing has not at all declined, as is so generally asserted by persons unacquainted with the facts. Even in 1879 there were fourteen entries, thirteen starters and ten finished—figures quite up to the club's average, and what is more, the racing of 1879 was particularly smart and interesting.

The time made during the last five years will average about 5h. 30m., or taking the distance sailed at forty miles only, the average speed will be seven miles, or nearly six knots, certainly a fair rate for racing purposes. This year there is so much building underway that many new craft will be out early in the season and their owners will want to know what their

ships can do. If the N. Y. Y. C. does not offer them the opportunity, the consequences will be evident enough; they will hoist the colors of the Seawanhaka or Atlantic, and what is their gain has already come to be the loss of the senior club of America.

For the sake of reference, as well as the interesting data contained, we publish herewith a table of the regular "regattas" of the New York Y. C., and a study of the same will be of much use to members of the club preparatory to making up their minds in relation to abolishing or continuing the June races:

Year.	Number of Boats Entered.	Number that Started.	Number that Finished.	Fastest Made Using the Rules. H. M. S.	Force of the Wind.
1845	9	9	3	5 23 15	S. W., strong.
1846	14	14	4	5 35 00	S. W., light.
1847	13	13	9	6 29 10	S. W., fresh.
1848	8	8	5	4 43 55	W. N. W. to N. W.
1849	6	6	6	7 02 19	S. W., light.
1850	8	7	5	5 37 07	S. W., moderate.
1851	6	6	1	5 39 45	N. W. to S. W., light and moderate.
1852	7	7	5	4 03 33	S. W., strong.
1853	8	8	7	5 55 30	S. W., moderate.
1854	14	14	11	5 30 04	N. W. to S. E., leading both ways.
1855	16	16	11	3 42 41½	W. by S., fresh.
1856	21	19	13	3 38 19	N. E., strong.
1857	21	19	19	4 56 47	W. N. W., fresh.
1858	23	23	8	7 20 45	N. E. to S. W., light and variable.
1859	19	16	13	5 19 38	S. S. E., with calm, closing fresh.
1860	16	14	13	7 09 36	S. E. to S. W., light, closing fresh.
1862	18	14	11	5 01 52	N. E., fresh.
1 63	16	15	8	5 49 05	S., light.
1864	12	9	9	5 37 37	S. W., light, ending fresh
1865	9	8	3	5 41 50	S. W., light to S. E. strong.
1866	7	5	5	7 19 05	S. to S. W., light rain squalls.
1867	13	13	8	6 22 40	S., with rain squalls.
1868	12	9	5	4 12 50	S. by W., fresh.
1869	15	13	12	4 51 30	S. E., squalls and rain.
1870	18	18	15	4 47 12	S.-S. W., fresh.
1871	26	25	23	6 09 19	S. E., moderate.
1872	15	14	10	5 41 01	S. W., light, ending fresh, S. E.
1873	20	15	11	4 01 20	S. W., fresh, ending N. W., squalls.
1874	16	12	8	4 49 10	S. E., strong rain squalls
1875	23	21	18	5 21 48	S., light at times.
1876	23	22	16	3 54 48½	S. E. by S., fresh.
1877	11	11	5	5 41 37	S. E. to S. W. fresh, ending N. W., squalls
1878	15	12	10	5 18 31	S., light, ending fresh.
1879	11	13	10	5 13 06	S.
1880	25	15	15	4 07 54	S. by E. to S. S. E., fresh.

*For *America's* cup.

The course in 1845 was from Robin's Reef around Southwest Spit and return. In 1846 the course was from Elysian Fields around Southwest Spit and return, and continued so up to 1865, when it was changed—from Owl's Head to Southwest Spit, around Sandy Hook Lightship, and return. In 1868 the start was altered to abreast the club-house on Staten Island. In 1871 the start was made from stakeboats in the Narrows, and in 1875 again shifted to abreast the club-house. In 1877 the start was made as in the previous year, but the matches terminated outside the Narrows, abreast of Buoy 15.

The races of 1864, 1868 and 1878 failed for want of wind, and those of 1847 and 1854 on account of "storm."

The tables show the results of resailing in these years.

THE LIST OF RACES.—In the Center Cap Race, Oct. 16th, 1879, there were four entries, not fourteen, as printed.

SCULLING AT JACKSONVILLE, FLA.—*Editor Forest and Stream*:—There is not perhaps in all the United States a city of greater animation than this during the winter season of the year. Its regular population is about 15,000, but during the winter season there is a floating population, varying from 30,000 to 50,000 souls, that come from everywhere, the reputation of the magnificence of the climate having gone in every direction.

On Saturday, the 31st inst., there will be a single scull shell boat race upon the St. John's River, just abreast of this city, that will excel anything of the kind. The Committee of Arrangements—Hon. Peter Jones, Mayor; Gen. William M. Ledwith, Major Sherman Conant, and J. P. Child, Esq.—offer a purse of $1,000 to the winner of the race. It will be a three-mile race, one mile and a half to a stakeboat and return, and the following scullers have already entered: George W. Lee, of Newark, brings with him an elegant shell-boat, made expressly for this race by the celebrated Waters, of Troy, N. Y.; L. B. Tuttle from Verplanck's Point, N. Y., is here, and practicing every day upon the river. A. Frenchy Johnson, of Boston, Mass., has also entered. Other distinguished "knights of the oar" will add eclat to this grand exhibition, and rooms are rapidly being secured at the principal hotels for the event. DICK TINTO.

BROOKLYN YACHT CLUB.—A meeting of this club was held Jan. 7th. The session was private, no public matters were transacted, and the election of officers was postponed till the February meeting.

HUNT'S MAGAZINE.—Time will tell. After sailing under the same cover for twenty-eight years, *Hunt's* for January, 1880, comes to us in all the freshness of a new shift of togs. Its new cover is appropriate and more artistic than the old. May this favorite magazine of yachtsmen all the world over flourish for all time to come.

LECTURES ON CANOEING.—Yachtsmen have profited much by the lectures delivered before them upon various occasions, and we are glad to know that so able and experienced a canoeist as Mr. A. H. Siegfried is open to engagements for the lecture season, his topics being "Canoe and Camp," and "The High Mississippi Under Sail and Paddle." In these he gives much valuable information concerning open air life on the banks of lake and river, and wherever his lectures are delivered sudden life is infused into the inhabitants, who all want to "go and do likewise."—the best thing to popularize so romantic and health-giving a sport. From the very nature of things, all Americans ought to be canoeists instead of sickly dyspeptics and haymakers dreading water worse than fire. The address of Mr. Siegfried is care "*Pioneer Press*, St. Paul, Mich."

WHERE TO BUY YACHTS.—We are often in receipt of letters inquiring about yachts in the markets, their records and value, etc. To all readers proposing to buy or sell yacht property we recommend application to the agency of Mr. Thos. Manning, the oldest and only reliable house of the kind in America, whose card will be found elsewhere. Mr. Manning has bought and sold the great majority of all yachts which have changed hands within the past seven years, and has a large selection of all rigs and tonnage now on his books. Yachts can be sent South or to the Lakes by inland routes. As tonnage is on the rise now is the best time to buy, before prices go up.

SEAWANHAKA YACHT CLUB.—The regular annual meeting of this club was held at Delmonico's, Jan. 13th, the Commodore in the chair. A flourishing financial exhibit was made by the Treasurer. Receipts, $3,636; disbursements, $2,318; balance in hand, $1,318. The following officers were elected for 1880: Commodore, W. W. Stewart, sloop *Regina*; Vice-Commodore, C. S. Lee, sloop *Schemer*; Rear Commodore, M. Roosevelt Schuyler, cutter *Yolande*: Treasurer, W. B. Simonds; Secretary, O. B. Cromwell; Measurer, A. Carey Smith; Regatta Committee, Robert Centre, Girard Foster, James H. Elliott, C. W. Betts and Lewis P. Bayard; House Committee, F. de Luze, David Crocker, Alfred Roosevelt. The club numbers 132 members. The following gentlemen were added to the list: Frank E. Peabody, cutter *Enterprise*, of Boston; Eugene La Chaise, cutter not yet named; Latham Fish, Com. A. Y. C., schooner *Agnes*. An amendment to the Constitution was adopted, providing for the election of a Board of Trustees of five members for the term of five years, one to retire each year in place of a newly elected member. The Board to present three names each year, one of whom is to be chosen by the club to fill the vacancy, unless the retiring trustee is reëlected. In the evening the club partook of their annual dinner in the banquet hall. This is the first time in America that a flag officer of one of the leading clubs hoists his broad pennant at the mast head of a genuine cutter. The world moves.

THE NATIONAL YACHTING ASSOCIATION.—The following clubs are among those who have signified their intention of taking part in the formation of the Association: Columbia, Jersey City, Portland, New Jersey, National, Hudson River, Cleveland, Toledo, Williamsburg, Empire, Buffalo, Albany. We quote the following from our excellent contemporary, the San Francisco *Olympian*:—

The project suggested, we believe, by Mr. C. P. Kunhardt, yachting editor of the New York FOREST AND STREAM, in the matter of a National Yachting Association, is meeting with the consideration it deserves. Representatives of the Brooklyn, New York, Jersey City, Salem, Manhattan, Hudson River and Empire Yacht Clubs recently met in New York to discuss the subject, and a committee has been appointed to prepare an address to the clubs of the United States, calling for a convention of yachtsmen for the purpose of organizing a National Association. This Association is to preserve all records, make rules for measuring, ballasting and sailing yachts.

The idea is a good one in many respects. As it is now, every club is on "its own hook," and all sorts of absurd rules of measurement, racing, etc., are in vogue. With an association harmoniously organized, and recognized by leading clubs, an improved spirit will be fostered among yachtsmen. They can all sail under the same rules, and comparisons of models, lines, etc., will doubtless be more frequent where yacht owners have more community interests than they have now.

There are a number of questions connected with regattas, etc., which should be definitely settled one way or another, by some authority, so that some rigid law or custom will be established. All these things will be better decided by representative yachtsmen in convention than by discussions in clubs.

And on the same subject the London *Field* says, in referring to a proposed constitution: "Nothing is said in these sections about subscriptions, either from private members or the clubs; but we presume that if a member is to pay £2 2s., each club would have to subscribe at least £10 10s. No provision is made for a committee or council of management, and this can be regarded as a very serious defect in the proposed constitution." As everything so far has been only of a preliminary nature we have no doubt that when more thorough organization is effected a satisfactory plan of action will be decided upon.

Our French contemporary, *Le Yacht*, likewise gives a hearty approval of this movement as follows: "The establishment of such an association has a double significance; for one thing it is evidence of the importance and growth of yachting in the United States, and for another, the novelty of its intended application is to the credit of American yachtsmen. It is with a view to creating a certain order out of the present confusion, and for promoting cordiality and unity of action among American yachtsmen, that the idea of forming this association has been developed during the past year. There is in this movement a controlling idea of the highest order which is bound to have fruitful results."

The success of the proposed Association lays entirely with the clubs throughout the country and the men at the helm. Most noteworthy is the ready manner in which Western clubs have come to the front, and by their support have shown themselves to be wide-awake organizations.

CLEVELAND YACHTING ASSOCIATION.—Matters are flourishing with this club, and next season promises to be a bright one. The annual regatta has been fixed for July 4th. Five new yachts are being built for the club. The *Tia*, formerly of Put-in-Bay, has been bought by Messrs. W. & H. Gerlach, and hoists the club colors. Messrs. Rettger have traded off their sloop *Vixen*, winner of last September race, for schooner *Star*, formerly of Sandusky. Geo. Parrish and Scott Robison have been elected members. The following committee has been appointed to confer with Secretary Frick, of the N. Y. A.—Captain F. W. Edwards, Frank H. Smead and W. B. Francis. Says a Cleveland exchange:—"The movement made of late years toward yacht organizations should be encouraged both by the United States Government and its private citizens, as all of these clubs are simply schools to perpetuate mercantile prosperity and the exchange of a widespread courtesy so necessary to the success of a nation united to the outside world by fleets of vessels."

REGATES INTERNATIONALES.—The International Regatta of Nice, France, promises to be a brilliant affair. Money and patronage will be expended upon it lavishly, and the prizes are no tin kettles or nickels either. In fact, in the matter of prizes France takes the lead of all others, and our own purses seem puny indeed compared to the value France sets upon winning a race. The regatta is under the patronage of the *Cercle de la Méditerranée*, with the Prince of Wales as Honorary President, and will be sailed Thursday and Friday, March 11th and 12th. First prize, $5,000 and work of art (offered by the *Yacht Club de France*), open to yachts over twenty tons; second prize, $600 and work of art; third prize, $300 and medal; fourth prize, $100 and medal. These look like business, and make it worth while racing for. What a pity that America will not be present in such a grand match! Course, thirty miles; entrance, $30; open till March 1st; after that double the entrance money. Second race, for steam yachts over forty tons, prizes, $4,000 and medal; $3,000 and medal; $600 and medal; $300 and medal, and $100 to the fourth; course, forty miles; sails allowed; time allowance based upon power of engines and tonnage; entrance, $30. Third race, yachts under twenty tons; no restrictions. Four classes, thirty-four feet, twenty-five feet, eighteen feet and fifteen feet, with three prizes in each class, ranging from $300 to $20. Course, ten miles, sail twice over; entrance, $9. Rowing races for four-oared boats follow; two miles; entrance, $20; prizes, $800 to $50. Single-handed sailing and also sculling races and yawl races complete what is probably the "biggest" thing of the kind ever gotten up. There will also be races for steam launches, for the naval forces and for unclassified boats. Pennants to all winners and trinkets to the successful helmsmen. The Committee of Organization consists of the following:—A. Borriglione, Mayor of Nice, Honorary President; Vice-Count Vigier (C. M.) (R. C.), President; Duc de Rivoli (C. M.), Vice-President; E. Rodrigues-Henriques (Y. C. F.), (C. de la V.), (R. C.), Secretary; A. Sicard (C. M.), Treasurer; Messrs. V. Béchard; A. Currie, British Consul; Dalmas, Houssay (C. de la V.) and E. Perignon (Y C. F.), (C. de la V.)

THE CANOE CONGRESS.—It is "booming," and a collection of a hundred canoes on Lake George, next August, is looked forward to with confidence by the knights of the paddle. Here is the generous offer of Mr. Rushton, the well known canoe builder of Canton, N. Y.:—

"*Editor Forest and Stream*:—You may put me down for a canoe, value not less than $75, to be placed at the disposal of the proper committee, as a prize to be contested for at the canoe regatta of the proposed National Club. This offer is subject only to the following conditions on my part: that such management and interest of canoeists will be displayed as will insure a successful meeting. I make this offer now, thinking a word of encouragement to-day might help more than one later in the season."

It is needless to say that the liberality of Mr. Rushton is fully appreciated, and we know of sundry heroes of the paddle who are already vowing they will have that canoe or capsize in the attempt. We suggest, as one feature of the racing programme, "a land and water," or a "portage" race. Start from a point on shore, make for the water, launch and board, paddle to another point portage across or down the shore, again launch and make the best time home to the start. Such a race would test the "all round" qualities of different types and the stay of the owners, besides being full of interest and incident. As the meet will attract many visitors to the hotels, it will be in order for them, as well as the various lines of transportation, to lend a helping hand and assist with prizes.

THE CANOE CONGRESS.

Editor Forest and Stream:—

The Lake George National Canoe Convention, to be held at Caldwell Aug. 3d, 4th, 5th and 6th, 1880—the call for which was published in the FOREST AND STREAM of Jan. 1st—promises to be one of the greatest events of the season. Responses are coming in from all quarters, and a liberal support of the movement is promised. N. H. Bishop, Esq., in a letter to one of the signers of the call, says:—"Captain Lee Harris, the owner of the little steamer *Owl*, who is an Adirondack guide, and lives in Caldwell, will 'enthuse' the Indians—some half-dozen or more who live in the outskirts of the village. He will try to find them birch trees large enough to make canoes, and if we offer a prize for an Indian canoe race, we may coax them into dressing in savage style and putting on the war paint. As their leader is thoroughly Christianized, and the best member of one of our churches, it may require the persuasive eloquence of Rev. Mr. H——, their neighbor and pastor (also a canoeist) to second Captain Lee Harris' work; but we must have an Indian canoe race on the Horicon of Cooper, if we have to import the Indians from Canada."

Judge Longworth, Commodore of the Cincinnati Canoe Club, writes:—"Several days ago I was handed a communication from yourself concerning a proposed convention of canoeists at Lake George in August next. Our club desires to join in the call for the convention, and to become a member of the National Association." JERSEY CITY C. C.

BROAD PENNANTS, BURGEES, AND COLORS.

Editor Forest and Stream:—

Having carefully read all your articles on yachting for some time past, I have come to the conclusion that your head is clearer on all matters of really practical yachting than any other journal I have ever seen, and you have done more to make our yachting men "sailor men." I am therefore tempted to submit to you a question which is now agitating the San Francisco Yacht Club.

The question is relative to the flags of our club. The racing or distinguishing, the Commodore's, and the Vice-Commodore flags, are all exactly the same shape at present, with nothing but the device in the centre of the flag to distinguish one from the other. This I claim to be wrong, as it would be utterly impossible for a stranger to tell the flagship from any other vessel of the fleet. I contend that the racing flag should be square, that the swallow tail is the flag of the commanding officer, and that it is the *shape* of the flag that gives it its significance, and the only thing that can be made out with any certainty from a distance.

I am met with the reply that our club has only followed the rule of the New York and other Eastern clubs, and that what they do we should do, and that the square racing flag is only the English custom. I do not know whether this claim is correct or not; but I am not prepared to admit that we should do what is evidently

thing because the New York clubs do it. I prefer to take as my standard the United States Navy, and there a swallow-tailed flag is the flag of the commanding officers.

Chief in all matters our yachtsmen would endeavor to follow the customs, usages, and courtesies of the United States Navy, they would attain nearer to what true yachtsmen should be.

Oakland, Cal., Jan. 6th. YACHTSMAN.

We might have blushed once upon a time at so complimentary an indorsement from such a source, but of late similar compliments have poured in upon us in a perfect tidal wave, and we are getting used to them, though they are as much appreciated as ever. The points taken by our correspondent are sound all the way through. Because New York has not yet adopted the yawl, our friends in San Francisco would hardly be likely to abolish a rig they have found so handy and efficient, and because New York is all at sea in its signals there is no good reason why any other club should follow suit. It is true that square racing flags for private signals, "swallow tails" for flag officers and pointed or triangular pennants for club "burgees" are in vogue in England; and it is also true that in matters pertaining to outfit and etiquette the English are very far ahead of American customs and practices. Consequently the San Francisco Y. C. can do no better than follow the English standard in preference to New York fashions. Moreover, the English method corresponds to usage in the navy, and as our correspondent says, in such matters the naval service is the true guide for all. San Francisco yachtsmen can add to their laurels by rectifying erroneous customs in signals, which had their origin in days when yachtsmen as a body were comparatively green.

R. N. S. Y. S. SWEEPSTAKES, JULY 22D, 1879.

Editor Forest and Stream:—

Will you allow me to correct a mistake in your issue of 1st January. In the article on the "Past Yachting Season" your correspondent must have been misinformed, when he states "there was some heart-burning caused by the Sweepstake Race here fixed for the 22d July being deferred by the referee till the following day." These remarks do the referee injustice; he is the oldest and one of the most respected yatchtmen we have, and certainly one of the most experienced. In the first place it was not "play or pay" on that day, unless the referee declared the day fit. It was left to his judgment altogether in the agreement signed by all hands. In the second place, the race was not put off on account of too much wind, as there was hardly enough for steerage way; but from the fact that a gale had been blowing all night, settling to a flat calm with thick fog. Any one who knows "Sambro," knows it is not the place to be with no wind and thick fog, as the shoals which surround it break very heavy and are extremely dangerous, even with a good breeze when you can avoid them, as there are heavy currents about them.

The opinion of the three pilots was "it was not fit to go there that day, for that reason." I can answer for the boats, and state we all determined to go, even without the pilots, if the referee declared the day fit. As we had to use oars to get to our moorings, there could not have been any heart-burnings on the part of the owners of the schooner, as they well know the only chance they have with the other boats is when it blows so hard the sloops cannot carry their sail, as the result of the race next day proved. I have too much respect for the gentlemen who own the *Seafoam* to believe they were dissatisfied with the referee for not starting the race on that day. And I do not think there was any influence brought to bear on that gentleman. HEBE.

Halifax, Jan. 11th.

Cricket.

UNITED STATES VS. CANADA.—Now is the time that the Canadian cricket clubs should look ahead and organize an association similar to the one in operation in the United States. Unless this is done, and a committee elected by the representatives of the clubs throughout the Dominion, the International Match which is to be played this year in the United States will be a failure. It is absurd to call the match "United States versus Canada," when the sides representing both countries are not representative. The playing strength of Canada is excellent and should be put forth; let therefore the Canadian clubs banish their petty jealousies and put an eleven in the field this season which will do honor to themselves and their people. There is no match which can do more good or increase the popularity of the game more than this one, and we trust within a short time to record that a Canadian cricketers' association has been organized.

DEATH OF E. G. WENMAN.—*Bell's Life*, of Jan. 3d, notices the death of this old professional. He was one of the members of the old Kent Eleven, a contemporary of Fuller Pilch and Alfred Mynn, and no unworthy rival either. As a wicket-keeper he has never been excelled. He died at a ripe old age, after enjoying a reputation during his life for perfect fairness and integrity of conduct.

THE AUSTALIAN CRICKETERS.—The Australians have decided upon paying a second visit to England during the summer of the present year. The team will probably be composed of A. and C. Bannerman, Spofforth, Evans, Garret, Massey, and Murdoch, from New South Wales; Boyle, Alexander, Blackham, Palmer, and W. M'Donnell, from Victoria. The Inter-Colonial Match of 1879 resulted in a victory for New South Wales.

WHAT IS THOUGHT OF US.—*St. George's Cricket Ground, Hoboken, N. J., Jan. 7th—Editor Forest and Stream:*—I think FOREST AND STREAM the best and most correct reporter of the noble game of Cricket I have seen. All your remarks and reports of the games I have seen, and that is a great many, have been well worded and correctly given, and in the analysis of the bowling, a very important point in the game, you have been the only one right, which shows a care and an intelligence not always displayed in the report of cricket matches by other papers. GEORGE GILES,

Professional St. George's Crickel Club of New York.

The coming season will make Mr. Giles' seventh year with this club.

—J. Whelan, who played for Canada in the Tournament at Philadelphia in 1875, and was for a short time the professional of the St. George's Cricket Club, of New York, scored a very fine and hard hit, 38, last season in England, in the match Leicestershire vs. Northamptonshire. Pinder, the wicket-keeper of Daft's team, said, when he was here, that "there were but few grounds in England too large for Whelan's immense hitting powers."

STATEN ISLAND CLUB.—The Staten Island Cricket Club elected during the season of 1879 ninety-eight new members, of which eighty-one were Seniors and seventeen Juniors. Of the twenty-two resiguations, thirteen were caused by members leaving New York. This shows the net gain to have been seventy-six. The total membership of the club at this date is three hundred and fifty-two, of which three are honorary, two hundred and eighty-three active, and sixty-six Junior. George Lane, the professional of last year, has been re-engaged for the coming season, and he is expected back from England early in April. The club will hold its annual meeting for election of officers at Delmonico's, Broad street, Feb. 2d, at 3:30 P. M. At this meeting the club will vote on the question of inserting in its constitution a clause preventing members of the club from playing against it in matches. This will be a very important point, for it is individuality that brings success.

—The St. George's Cricket Club will hold its annual meeting for election of officers on Feb. 2d at 8 P. M. at Delmonico's, Twenty-sixth street.

ENGLAND'S HIGHEST BATTING SCORES IN FIRST-CLASS MATCHES FOR 1879.

The following statistical report has been carefully compiled from *Bell's Life*, of London. The list, which contains every score of 80 runs and over obtained in first-class matches during the past season, foots up, strange to say, to exactly 200 innings—100, or one-half, of which are for scores which top the century. The following will show how they were graduated: Of the 200 scores made 58 were from 80 to 89 runs, inclusive; 42 from 90 to 99 runs, inclusive; 35 from 100 to 109 runs inclusive; 26 from 110 to 119 runs inclusive; 13 from 120 to 129 runs inclusive; 10 from 130 to 139 runs inclusive; 6 from 140 to 149 runs inclusive; 4 from 150 to 159 runs inclusive; 2 from 160 to 169 runs inclusive; 2 from 170 to 179 runs inclusive; 1 from 180 to 189 runs inclusive; 1 over 200 runs.

The highest individual score was obtained by T. A. Fison, 264 not out, in the match Hendon vs. Highgate.

W. G. Grace played the only three first-class three-figure innings of the season, 123 runs, Gloucestershire vs. Surrey; 102 runs, Gloucestershire vs. Nottinghamshire; and 113 runs, Gloucestershire vs. Somersetshire. Mr. Grace was also the only batsman who contributed scores of over 80 runs in each innings of a match—85 and 81 not out, Gloucestershire vs. Middlesex.

According to the list furnished by the *Sporting Life* of London, 231 scores of 100 runs and upwards were recorded in all British matches during last year. This summary, however, is acknowledged to be incomplete, owing to the careless manner in which matches were reported, or the absence of replies to letters requesting information. The highest individual score made in any match was 285 by L. Stokes, R. Page's Eleven vs. Colchester Garrison.

H. W. Renny-Tailyour contributed six centuries—149, 147, 121, 119 not out, 111 and 101.

The seven three century scorers were: W. J. Ford 159, 109 and 100; A. S. Francis, 158, 105 and 104; W. G. Grace, 123, 113 and 102; R. A. Miller, 117, 109 and 108; W. B. Pattison, 113 not out, 110 not out and 104; J. Shuter, 156 not out, 116 and 110; and A. J. Webbe, 130, 122 and 102.

The seventeen two century scorers were: B. Blaxland, 136 and 135; J. G. Bradshaw, 185 and 107; M. B. Buckle, 134 and 104: Lord Burghersh, 123 and 118 not out; T. A. Fison, 264 retired and 100; A. F. J. Ford, 222 and 138; E. M. Grace, 114 and 103; W. Hearn, 161 not out and 103; L. K. Jarvis, 174 not out, 114; E. A. Park, 110 and 105 not out; G. Remnant, 140 not out and 109; F. W. Rhodes, 100 and 100; R. J. Savery, 146 and 131; D. Q. Steel, 128 and 126; C. T. Studd, 121 and 112 not out; E. F. S. Talecote, 123 and 121; W. G. Wylde, 114 and 103 not out.

AVERAGES FOR 1879.

LONGWOOD CRICKET CLUB.

The Longwood Cricket Club, of Longwood, a suburb of Boston, Mass., has been in existence about three years. It is composed of gentlemen engaged in business in that city, and its name in the vicinity is one synonymous with amateur cricket. Until this time, the club has been playing on uninclosed grounds, which were decidedly limited; and, excepting the infield, rough to play upon. We are now, however, enabled to announce that the Athletic Department of the Boston Driving and Athletic Association has secured a site at Beacon Park, twelve miles ride from the city proper, on the Boston and Albany Railroad, and that in another season the Longwood Club will take possession of the new cricket ground, which is to be only one of the many attractions offered for the promotion of amateur athletics in Boston. Having made mention, in a late number of the FOREST AND STREAM, of the new Association, it is needless to say more here than that it already numbers over 150 active members, and the opening day of its first year is fixed for May 1st.

The grounds at Beacon Park are thought by the Directors to be peculiarly available for the purposes of the Association, and they deem it important that advantage be taken of the opportunity offered by further speedy organization. The Directors will receive applications for membership to the number of three hundred, and we would urge those desirous of joining the Association to make such application at an early day.

The plan of the grounds, as laid out by the well-known engineer, Mr. Ernest W. Bowditch, shows the proposed disposition of space available for athletic games, and from it we learn that the cricket field will contain about 16,000 square feet sodded, and an almost unlimited level outfield, on which a man can run out almost any hit. As the park lies on the west bank of the Charles River, it is also proposed to station a float for the use of members rowing from Boston or points above the grounds. With the different facilities for reaching the park, and bearing in mind that Boston has always needed a breathing spot of this kind where her amateurs might go to "spread themselves" in anything athletic, there is nothing that we can see to prevent the Association and the Longwood Club from being an assured success from the start.

Through the courtesy of Mr. H. F. Fay we are enabled to give the batting and bowling averages of the club for last season:—

Women's Column.

SOME DOGS THAT I KNOW.

AS a reader of FOREST AND STREAM I gladly hail the improvement of a Woman's Corner devoted to herself, and hope my sisters far and near will have something to say every week in this "man's paper, conducted by men, for men, and about men." Here is my contribution, and I will begin about a dog. He wasn't a setter, nor a cocker spaniel, nor a Laverick pup, but a homely, stubbed-tailed, cropped-eared, yellow cur, named Tip, but for knowingness and lovingness Tip might take the cup. We had a cat also, and the two not only tolerated each other, but actually enjoyed playing and eating together. One plate of bones did for both, and they lay amicably side by side on the mat. Tip liked to take his walks abroad, and puss stayed at home, but when she heard his bark at the door ran to welcome him. One day his bark didn't bring any one to let him in, and the cat used her feline wits to some account. The door bell hung a short distance from the floor, and she struck it with her paw. The sound brought me into the entry, and I saw pussy prepared for another strike, while Tip was outside barking his head off. On opening the door Tip rushed in, and they were tearing around the dining-room in high frolic. Don't tell me cats can't put this and that together.

I wonder why music affects dogs in such a mournful manner. If Tip had any sorrow the sound of the piano always seemed to bring it to the surface. We were singing Moody and Sankey the other evening, and Mr. Blowhard, our handsome tenor, was doing his prettiest. Tip sneaked in and sidled up to Mr. Blowhard, who, with his handsome nose toward the ceiling, was in the midst of "There's a land that is fairer than day," when the dog gave a prolonged howl that was enough to make the neighbors shut their doors and windows, and send Tip under the piano with a "ki-i-i," being hastened thereto by a gentle reminder from the tip of Mr. Blowhard's boot. He broke up the concert. I have heard others speak of the same effect of music on dogs.

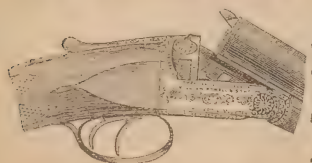
If Flossie, the cat, loved Tip, she hated Poll Parrot, and we never could keep the peace between them. Poll's weapon was her strong beak, and if she wanted a convincing argument she would bite hard enough to draw blood. I've seen Poll perched on the back of a chair, silent and motionless, asleep you would say, but I, knowing her innate ugliness, would be sure she was planning mischief. Kitty would be taking her after-dinner nap by the fire, when Poll would climb down the back of the chair, waddle across the carpet, and grab the end of kitty's tail. With an angry mew she would dash for the lounge, while Poll would give vent to an amused chuckle, and waddle back to the chair, muttering "Naughty Poll! very naughty Poll!" Kitty would drop asleep again, and Poll, after watching her from the corner of her eye, would steal down again, climb the lounge and get a firm grip of the cat's ear. This would be too much for kitty, and she would rush for the door, while Poll would chuckle harder than ever. But kitty would have her sweet revenge, for Poll was always on hand at dinner time, perched on the back of a chair, sober as a judge, and waiting for a chicken leg or wish bone. She would hold the bone with one claw, and look very much as if she was playing on the flute. Now was kitty's chance; she would jump on the seat of the chair and give a little pat with her paw on Poll's breast. Poll's ire would be raised in an instant; her eyes would flash, and dropping the bone, she would go for pussy's ears with her beak, but

kitty would jump down, grasp the bone and silently steal away.

You could not make Tip understand he wasn't one of the family, a sharer of joys and sorrows, and perfectly proper to be with us on every occasion. Sundays were trying times for him; if he was not locked up in the house he would be sure to go with us to church, and his mournful face at the parlor window and dismal whine would quite haunt us. The Doctor remembered one Sunday morning that the back pantry window was open, but hoping Tip wouldn't find it, gave himself up to the service. But Tip was on the alert, and was out of the pantry window and off for church before service was well begun. A late comer let him into the church, and Tip walked up the broad aisle smelling at every pew door as he went along. Talk about perseverance! that dog went slowly up the middle aisle and never missed a seat; crossed at the top and came down the side where we sat near the door.

Of course we were in a cold perspiration, and the Doctor was trying to look oblivious to every earthly consideration and engaged with old Doctor Pentateuch's seventeenthly. But Tip arrived at our door and then his stub of a tail commenced to wag and we let him in in a hurry to stop any further demonstrations, and his stub would come against the side of a pew like the beat of a drum; the Doctor had to hold it through the rest of the sermon, while all the young girls around giggled instead of keeping their eyes on old Doctor Pentateuch, and the Doctor vowed Tip should be locked in the cellar every Sunday and he would keep the key in his pocket.

One of our neighbors has a splendid large dog, a terror to peddlers and the tramping fraternity; not one dare approach the steps unless the dog is called off, and yet a lady or gentleman can come up the walk and ring the door-bell, while Major will wag his tail in the friendliest manner. Major is a splendid watch dog, but there is one thing that will take the starch all out of him and make him a quivering mass of terror, and that is a thunder storm. Long before it bursts forth something in the air warns him, and he will come to the door and beg pitcously to be let in. And Matilda will let that dog in, even if it is midnight. He goes straight to a certain large closet up stairs, and a lamp is lighted and put on the floor so Major won't see the lightning. A. L.



Hartford, Conn.

—Dr. Birsch, of Belgium, has canary birds of the Norwich breed. Before and after they moult he feeds them with white of egg sprinkled with Cayenne pepper, and their color becomes red. So he says.

—It is very easy to believe that everything is for the best when you are sitting at your oars and floating down stream, but very much harder to believe it when you are tugging against the current with both oars and cant stop to brush away the mosquito who has just lighted on your face and is sharpening his bill for a good breakfast.

—Europeans think, and perhaps justly, that we Americans are a bit conceited in our valuation of ourselves. An Englishman quoted a statement made by a Westerner in proof of this criticism. He did not see that it was a joke, but regarded it as a matter of fact assertion. "Why," said he, "I heard the other day of one of your countrymen that he boasted that he could jump higher, and stay up longer, than any other person in the country. That, you know, is impossible, because the law of gravitation is the same everywhere."

THE GUN OF THE FUTURE.

Miscellaneous.

SOMETHING NEW FOR 1880.

THE LITTLE GIANT

Pocket Scales.

A GREAT CURIOSITY.

THE MOST USEFUL INVENTION KNOWN.

WEIGHS FROM ONE OUNCE TO 8 POUNDS.

THE ONLY SCALE OF THE KIND MANUFACTURED.

ELEGANTLY NICKEL PLATED, AND WARRANTED ACCURATE.

PRICE FIFTY CENTS.

Sample sent by mail to any address on receipt of the price.

MANUFACTURED ONLY BY

Chas. Thompson,

Bridgewater, Conn.

THESE LITTLE POCKET SCALES weigh from one ounce to eight pounds. Each and every one is warranted accurate, or money refunded. Everybody needs one, as they can be easily carried in the vest pocket, and they take up no more room than a small pocket knife. They are elegantly nickel plated and nicely finished, and will last a lifetime with ordinary care.

The Commercial Advertiser of Detroit, Mich., says:—

"Of the thousands of new inventions which make their appearance yearly, but few are of practical use, but when we see one that fills the bill for the purpose for which it is intended, we are forced to acknowledge its merits. Such is the case with THOMPSON'S LITTLE GIANT POCKET SCALES. They weigh accurately, and can be carried in the pocket, and are sure to become as indispensable an article as a pocket knife. Hereafter we do not expect our wives will be grumbling about the butcher cheating us in weight, for we intend having a pair of these scales in our pocket at all times."

Every business man, mechanic, or farmer, every employer, and every employé, male or female, needs THE LITTLE GIANT SCALES, as they can be depended on at all times for accuracy in weighing. I am the Sole Manufacturer of these Scales and own all the tools and special machinery for making them. Only skilled labor is used in their construction; hence I am able to make them perfectly. The pattern is the most beautiful one made. They possess two great advantages; beauty and elegance of design and finish, and accuracy in weighing. No dealer in the world can give you a Scale equal to this for less than $5.00. Every Scale we send out is in perfect order, and is warranted for twenty years, with good usage and care. It is the biggest bargain in America, and is very low at 50 cts. each, and we guarantee satisfaction or money refunded.

AGENTS WANTED EVERY WHERE!

to introduce these Scales in all sections of the country; and you will find them the very fastest selling article on the market. Order a few dozen, and give the business a trial. Some of our agents sell a gross a week right along, which is good enough wages for anyone. All we ask is to give them a trial. We offer you no clap-trap, trashy chromos, or receipts, but something that is good and useful for everybody, and will stand on its own merits. Our discounts to agents are very large, which will enable you to double your money.

The attention of Novelty Dealers and experts is called to these scales. Correspondence solicited.

Agents should send in their orders at once, and get the start. Don't delay, but order at once These scales will sell to nearly every family Hunters, trappers and sportsmen will buy them at sight, as they are no "catch-penny" affair, and are original and unique in design and construction. By making these scales a specialty, getting them up in large quantities, under our own personal supervision, and only using first-class material, we are able to sell this article at a lower price than the same could be produced by most manufacturers. These Scales are finished in heavy nickle plate, and thoroughly tested before being sent out, and satisfaction is guaranteed in every particular.

Sample mailed free to any address on receipt of 50 cts., or three scales for $1.00.

Circulars free to any address.

All orders should be plainly directed to

"THE FISHING LINE."

TAKE THE

Grand Rapids & Indiana R.R.

Mackinaw, Grand Rapids and Cincinnati Short Line

FOR THE

Trout, Grayling, and Black Bass Fisheries,

AND THE

FAMOU SUMMER RESORTS AND LAKES OF

NORTHERN MICHIGAN.

The waters of the

Grand Traverse Region

and the Michigan North Woods are unsurpassed, if equaled, in the abundance and great variety of fish contained.

BROOK TROUT abound in the streams, and the famous AMERICAN GRAYLING is found only in those waters.

The TROUT season begins May 1 and ends Sept. 1.

The GRAYLING Season opens June 1 and ends Nov. 1.

BLACK BASS, PIKE, PICKEREL and MUSCALONGE, also abound in large numbers in the many lakes and lakelets of this territory.

The sportsman can readily send trophies of his skill to his friends or "club" at home, as ice for packing fish can be had at many points.

TAKE YOUR FAMILY WITH YOU. The scenery of the North Woods and Lakes is very beautiful; the air is pure, dry and bracing. The climate is peculiarly beneficial to those suffering with

Hay Fever and Asthma Affections.

The hotel accommodations are good, far surpassing the average in countries new enough to afford the finest of fishing.

During the season Round Trip Excursion Tickets will be sold at low rates, and attractive train facilities offered to Tourists and Sportsmen.

Dogs, Guns and Fishing Tackle Carried Free at owner's risk.

It is our aim to make sportsmen feel "at home" on this route. For Tourist's Guide (an attractive illustrated book of 80 pages), containing full information and accurate maps of the Fishing Grounds and Time Cards, address A. B. LEET, Ger. Pass. Agent, Grand Rapids, Mich.

Old Dominion Line.

THE STEAMERS of this Line reach some of the finest waterfowl and upland shooting sections in the country. Connecting direct for Chincoteague, Cobb's Island, and points on the Peninsula. City Point, James' River, Currituck, Florida and the mountainous country of Virginia, Tennessee, etc. Norfolk steamers sail Tuesday, Thursday, and Saturday. Lewes, Del., Monday and Thursday, at 2 P.M. Full information given at office, 197 Greenwich Street, New York. sep28 ly

GUNPOWDER.

DUPONT'S

RIFLE, SPORTING and BLASTING POWDER.

The Most Popular Powder in Use.

DUPONT'S GUNPOWDER MILLS, established in 1801, have maintained their great reputation for seventy-eight years. Manufacture the following celebrated brands of Powder:

DUPONT'S DIAMOND GRAIN.

Nos. 1 (coarse) to 4 (fine), unequaled in strength, quickness, and cleanliness; adapted for Glass Ball and Pigeon Shooting.

DUPONT'S EAGLE DUCKING,

Nos. 1 (coarse) to 3 (fine), burning slowly, strong, and clean; great penetration; adapted for Glass Ball, Pigeon, Duck, and other shooting.

DUPONT'S EAGLE RIFLE,

A quick, strong, and clean Powder, of very fine grain for pistol shooting.

DUPONT'S RIFLE, FG, "SEA SHOOTING," FFG and FFFG. The FG for long range rifle shooting; the FFG and FFFG for general use, burning strong and moist.

SPORTING, MINING, SHIPPING, and BLASTING POWDERS of all sizes and descriptions. Special grades for export. Cartridge, Musket, Cannon, Mortar, and Mammoth Powder, U. S. Government standard. Powder manufactured to order of any required grain or proof. Agencies in all cities and principal towns throughout the U. S. Represented by

F. L. KNEELAND, 70 Wall Street, N. Y.

N. B.—Use none but DUPONT'S FG or FFG Powder for long range rifle shooting.

THE HAZARD POWDER COMPANY

MANUFACTURERS OF

GUNPOWDER.

Hazard's "Electric Powder."

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. *only.*

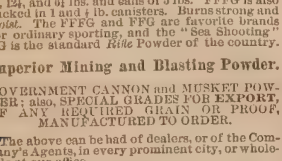
Hazard's "American Sporting."

Nos. 1 (fine) to 6 (coarse). In 1 lb. canisters and 6¼ lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shot guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6¼ and 12½ lb. kegs. Burns *slowly* and very clean, shooting remarkably close and with *great penetration.* For field, forest, or water shooting, it ranks any other brand, and it is equally serviceable for muzzle or breech-loaders.

Hazard's "Kentucky Rifle."



FFFG, FFG, and "Sea Shooting" FG in kegs of 25, 12½, and 6¼ lbs. and cans of 5 lbs. FFFG is also packed in 1 and ½ lb. canisters. Burns strong and *moist.* The FFFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard *Rifle* Powder of the country.

DITTMAR POWDER.

Champion Shot Gun and Rifle

POWDER OF THE WORLD!

IS UNEQUALLED BY GUNPOWDER

for strength, accuracy, cleanliness, and gives little smoke, recoil, or noise. It is absolutely safer than gunpowder, as it cannot explode when not confined, and does not strain the gun or heat the barrels as much in rapid firing. Captain Bogardus, champion wing-shot of the world; Dr. Carver, champion rifle-shot of the world; and all the leading shots, use DITTMAR POWDER in their matches. Our challenge to shoot a long range rifle match, as published in our circulars, was never accepted, and is yet open to the world. Address

"APANULE"

CURES BY ABSORPTION.

RHEUMATISM, NEURALGIA, MALARIA.

"Sapanule," the wonderful *Glycerine Lotion*, is a positive cure; it has never failed.

"Sapanule" has no equal for Chronic Lameness, Lame Back, Lumbago, Sprains, Piles, Chapped Hands, Chilblains, Bunions, and all diseases of the Skin, Erysipelas, Salt Rheum, Eczema, Humors of the Scalp, etc.; Diphtheria, Sore Throat, Pneumonia, and all inflammatory diseases. Ladies who suffer from local difficulties find immediate relief, and a permanent cure by using "Sapanule." Used in sponge or foot bath removes all soreness of body, limbs and feet. Satisfaction guaranteed or money refunded.

Sold by all Druggists. Price, 50c., and $1 per bottle. and for illuminated circular and cards.

Volume 13—No. 26. No. 111 Fulton Street, New York

The East Branch of the Penobscot.

TWO HUNDRED MILES THROUGH MAINE IN A CANVAS CANOE.

THIRD PAPER.

AT 5:30 A.M., August 20th, our camp was alive with preparations for the long anticipated run down Webster River, ten miles to the East Branch of the Penobscot River, and, as it afterwards proved, was the most exciting day's experience of the two hundred mile tour. Blankets, overcoats, and tent, were rolled closer than usual, and leather thongs five feet in length (some three dozen of which I had brought with me) were tied about them and safely crowded into the bottom of the long rubber bags. Covers to the various provision boxes, and pails were secured with straps and ropes, and every part of the camp kit made to occupy as little room as possible in the four canoes. Rubber leggings and wading shoes were put on and all unnecessary wearing apparel wrapped in rubber blankets and tied to the boats, that nothing might incommode the free use of our arms in the passage of the falls and cascades of the stream. The stretcher of our canvas boat was fastened to the wooden knees more tightly with thongs that no possible chance of accident might occur, while the pieces of extra canvas for patching the canoe, with their accompanying needles, wax, and water-proofing, were tied in a convenient place in the bow, and before we had completed the day's adventures we found them of great service.

Webster Stream is about sixty feet wide, and in its course from the lake of the same name to Grand Falls (two miles above its mouth) descends one hundred and ten feet, while the falls, including the rolling dam and cataract below, make the entire distance to the East Branch of the Penobscot not far short of one hundred and seventy feet. The stream issues from the lake with little force, being clogged by a mass of logs, the remnants of various "booms." As it passes downward in its course, heavy walls of rocks crowned by tall pines arise on all sides, often darkening the waters and producing a cañon-like appearance of the surroundings. The course of the river is over immense boulders and ledges, often unobservable just beneath the surface, while others in sight stand like sentinels in the middle of the stream disputing one's passage. The flow is repeatedly marked by beautiful falls and rapids, not high, but crowded together in narrow parts which give greater expression and grandeur to the water, presenting at various points the most remarkable scenery in this section. Cascade succeeds cascade, ending often in an abrupt pitch of three to five feet, and at their base are dark boiling pools flecked with snowy foam.

The river has not great depth of water at any time, three to five feet on the average, but we were fortunate in the extra supply of the last weeks' rain, which, although it prevented many "carries," also increased in volume and force of water to that extent that made canoeing hazardous and filled our path with greater dangers. The ladened birch canoes had passed us down the river, when the Quartermaster and writer, buckling their belts tighter about them, stepped lightly into the canvas canoe and swung out into the impetuous river with feelings similar to what might be expected in one entering a battle. My friend at the stern held a trusty paddle, whose strength had more than once been tried, while the writer in a devotional attitude on a rubber blanket at the bow, held a long "setting pole" ready for duty at a moment's notice.

In half the time I have narrated the above, we were among the furious rapids, battling with their difficulties and shouting to each other above the roar of the waters how best to circumvent them.

The sun unfortunately shone the greater part of the time in our faces, which produced a glimmer on the water, often preventing the discovery of sunken rocks. At one time, while dashing down a cascade, we mounted such a boulder, and swinging around leaped a five-foot fall, *stern first*, much to our peril. Again with mighty force we were hurled close to the rocky shore, which only a desperate use of the paddle prevented our striking. At times we were obliged to hold the canoe in the middle of the stream by the long "setting poles" firmly planted in the bottom, while we made our decision regarding the better of two channels—dangers of which there was little choice. Then on we went through the rush of waters, our "setting poles" keeping time with our eyes, noting the sunken rocks by the waters' upheaval, avoiding this sharp ledge, or that rough boulder, or swinging into the foam of another, as we shot swiftly by. Often with ease we thought to pass a distant rock, but mistaking the velocity of the water, doubled it by a hair's breadth. One fall over which the guides had *led* their canoes, we amateurs passed in the canvas canoe, the water falling in spray about us, but the cheer for our bravery, with which we were greeted at its base, paid us well for the risk incurred. At "Pine Knoll" we were obliged to let our canoes over the falls by long ropes from the cliffs above, and at another, soon after, two of the guides, Weller and Morris, passed safely in our canvas boat, on account of its slight draft of water, although they carried the birch canoes around.

So we continued our rapid progress down the stream, running most of the falls, our boat conforming to each situation, and almost seeming a part of us and taking an interest in our exploits. At noon we stopped for an hour's rest and lunch on the right bank of the stream, and while disposing of hard-tack, canned corned beef and coffee, our Artist plied his profession and then on we went through other perils.

It was fearfully fascinating, as our four canoes following each other's lead dashed onward through dangers which one could hardly anticipate before they were passed, only to be repeated and repeated at every mile of the stream. But the stimulant to one's feelings gave strength and courage and even recklessness, which in the wild surroundings made one feel as if no danger was too great to dare. An hour after our tarry for lunch we entered the deep and narrow chasm of swift, dark water above Grand Falls, and swinging our canoes into an eddy on the left, under the shadows of a great rock (some five hundred feet high) we stepped out on the shore, having completed the excitements of a half day that many years will fail to erase. Our canoes had suffered less than we had anticipated.

A sharp rock had left its mark on Bowley's birch, which the application of rosin and grease rectified. The bottom of the canvas boat had two small cuts about midships, so the use of needle and thread soon became necessary, the Quartermaster and *Compagnon du voyage* choosing for their *modus operandi* different sides of the canoe, putting the needle back and forth with iron pliers. A few moments' rest, and while the guides were "sacking" the camp kit across "Indian Carry," three-quarters of a mile to the East Branch (at right angles with Webster Stream), we gathered up the Artist's camera and plates, and pushed forward to examine the picturesque beauties of Grand Falls, and catch all we could while the light lasted.

Grand Falls is from forty to fifty feet high, seventy-five feet wide, surrounded on all sides for half a mile by ledges of iron-colored rocks, of nearly the same height, which decrease in altitude as they near the Penobscot River below. From a point beneath the scene is grand in its sombre magnificence, as the swift torrent, striking midway upon a projecting ledge in the centre of the fall, rebounds in foam flakes, which after the momentary interruption continues to fall into the dark whirlpool of water below. We place the tripod on a prominent ledge, and mounting the camera, our Artist prepares the plates in his mysterious cloth-covered box or "dark room," while we further exclude the light by covering him with our rubber blankets. But the mist and spray blind us, and we are obliged to gather up the camera, and retreat to another ledge, before we can operate.

The water, of a dark reddish hue—in strong contrast with the snowy foam—circles around and around in the eddies, kissing the rocks on all sides in its whirl, and amid the roar of the fall goes dashing on for about four hundred feet, and then plunges over a "rolling dam" on its way to the Penobscot, making canoeing the balance of the distance on this river impossible. The light from above reflecting on the cliff above the falls, glancing with rich beauty on rock and cascade, the fantastic growth of trees on every ledge, make up a fascinating charm that each succeeding picture varies in detail, but which pertain with almost equal force to every part of the entire chasm. While our Artist was at work we busied ourselves gathering the luscious blue and black berries and scarlet wintergreen berries, which grew in profusion around us. They were of great size, the average blueberry being an inch, and the wintergreen berries an inch and a half in circumference, measurement being taken at the time on the spot. After filling a three-quart pail with berries we divided the Artist's "kit" among us, found the "carry," and pressed on to camp, to which place our guides had preceded us with tent and canoes. Supper ended, we again sought the river's bank, a mile below the falls at a place called "the Arches," where, in the radiance of a gorgeous sunset, again drank to our fill of this picturesque locality. Words fail to describe the beauties of this scene, with which even the guides, slow to recognize the attractiveness of nature, were enraptured. Around the big camp-fire that night each narrated his individual experience of the day's adventures and the hair-breath escapes in running the rapids.

"But," says Bowley, the guide, "you should accompany the lumbermen 'on the drive' and see the perils they run while starting a 'jam' on these rivers. Often the logs are piled one upon another, until it seems that nothing but an avalanche would start them. But one log is loosened, and then another and another, and in a moment the whole mass goes sweeping down stream with terrific force, and woe betide the un lucky 'driver' in its path."

From the first of the trip to this moment, the guides had failed to praise the working of the canvas canoe, as it came in competition with their birch barks. But this day's trial proved beyond question its qualities, and wrung from them an acknowledgment they were not slow to utter. "It was fun to watch you gentlemen," says Morris to the Quartermaster and myself (as we sat drying ourselves before the fire). "You came over the 'rips' like a perfect duck; I don't believe you could drown the craft if you tried;" while the French Canadian, Weller, taking the pipe from his mouth, ejaculated, "*Ma fois!* she goes over the falls like a chain over a log."

On Thursday, August 21st, we wet our canoes for the first time in the East Branch of the Penobscot River, although from Chamberlain Lake to this point it is strictly a part of the same stream under different names. The river at this spot is only about fifteen feet wide, very deep, with long meadow grass lapping and fringing its border, and flowing with the rapidity of a mill course, each bubble as it shot by seeming to have an individuality of purpose, which to the writer was very amusing. Hardly had we dropped into our accustomed positions in the canoes before we were swept away from the bank, past the tall alders, and darted with lightning speed down the river, a mile and a half and out on to the placid Matagamonsis Lake. This was one of the loveliest bodies of water on our course, dotted with small islands and far reaching points of shore, the tall Norway pines forming a wall of beauty on either side. The lake is about one mile wide and four long, and the spruce-covered tops of Sourdnahunk Mountains to the southwest are reflected in its mirror-like surface. From the top of a bold crag at its foot we stopped for a sketch of the lake and then passed downward through the sluggish stream of three miles which connects it with Matagamon, or Grand Lake.

To the left or east of this stream, and half way between these lakes, is another lake about two miles in extent, which we fail to find noticed on any map we have seen, and lies in close proximity to Hay Creek, but is not what is termed in this section "a logan." Half a mile from this lake the stream passes under a foot bridge which leads to Trout Brook Farm, on Trout Brook Stream, the first loggers' camp since leaving Chamberlain Farm, a distance of over seventy-five miles. This farm, owned by E. S. Coe, Esq., of Bangor, consists of four houses, built close together, and eight or ten barns, with about four hundred acres of cleared land, through which flows the swift running Trout Brook. Half a dozen batteaux lay turned over on the grass, bounteous crops of oats and potatoes were ripening in the fields, while the industrious chicken (evidence of civilization) was picking about the doors. The house where our party dined was occupied by a man and his wife and one small boy. The rooms to this house were low and smoky, like all the rest we had seen, with the big iron box stove in the centre; the only change from the usual wall decoration was perceived in an advertisement of Pinafore opera music, which, pasted beside the other illustrations, made us feel quite homesick.

After dinner at the house our party bade our new found friends adieu, and paddled down the thoroughfare into Grand, or Matagamon Lake, which is about one third larger than Lake Matagamonsis, and we went into camp on the right bank, at its foot, near another old dam.

The eastern shore of this lake (the largest body of water on our course since leaving Chamberlain Lake) is not especially attractive to the Artist, being low and covered with meadow grass. But the western is decidedly picturesque, being bold and rocky, which, climbing from elevation to elevation, finally culminates in the precipitous and rugged peaks of Matagamon Mountain, towering above one's head to the height of six hundred feet, and is almost divested of foilage. We halted but one night on this lake, but were well rewarded by the number and size of the fine trout captured, adding also to our creel a salmon.

THOMAS SEDGWICK STEELE.

(To be Concluded.)

NOTES FROM NORTHERN TEXAS.

THE place from which I write this sits on the northern edge of Texas, four miles from the beautiful Indian Territory. It is the southern terminus of M. K. & T. Railroad, and the northern terminus of the Texas Central. Seven years ago the place where it stands was a cotton field; now it is a bright, sparkling little city of seven or eight thousand people. The old gentleman who owned the cotton plantation has retired to enjoy his *otium cum dignitate* and to wonder at the sudden strokes with which Fortune sometimes—very rarely—hits a fellow. He owns but a little part of this plantation now; he sold it off by the foot instead of the acre; but what little of it he has left to him returns him a far bigger income, in the shape of rents for stores and residences, than it brought him when cultivated in cotton. He lives happily; thinks the Almighty never created such a place as

Denison, and grows visibly more fleshy continually. I love to meet with these old fellows to whom Fortune has been extraordinarily kind. They appear to love others almost as much as themselves; are filled with a very pleasing and sweet *bon-hommie*. It might have been different with those who have incurred great fortune after living a hard life: such it might puff up to great pride and general beastliness. But when Fortune strikes an unsophisticated old farmer in this way it makes him all loveliness and sweetness. It makes the old fellow feel good all over. His smiles are sweeter than those of a cape jessamine.

The residences here please me very much. None of them are ambitious or costly, yet they are constructed with so much neatness that they have a very pleasing effect. To look at the houses in which these people dwell makes me think that they are prosperous and well raised. The finest structure in the city—it cost $40,000—is the school-house. Commend me to a people who make education their chiefest ornament. The business part of the town is not so striking: nice two-story bricks sandwiched between wooden shanties. But it is always thus in new towns that spring up along railroads. After a while some good conflagration will take away these old shanties and then Denison will be pretty all over.

The point that strikes me very strongly here is this: It is the best point in Texas for the establishment of manufactures. Oak wood is only $3 a cord at retail, and in large lots might doubtless be had at much less. Coal is delivered at $4.15 per ton, and by the hundred tons it doubtless could be had at $2. The McAllister coal fields are only ninety miles away, and I am told that it is put on the cars there with a handsome profit at $1.25 per ton. There is no other place in Texas where fuel is so cheap. There is no running stream, but then Red River is only four miles away, whose water might be utilized, and artesian wells might easily be had. It is a very fine cotton country about here. They never fail in that crop; the caterpillar never comes here. And also on the "Black Waxy" prairies it is fine for wheat. Thirty to thirty-five bushels to the acre is by no means an uncommon crop hereabout. This year however, their wheat was cut short by the great drought—the first they have had in fifteen years. They have no manufactures here now except one flouring mill, and a huge cotton compress, if that may be called a factory. Here is a fine chance for the profitable investment of Yankee capital.

Sunday, instead of going to church, Mr. T. V. Munson and myself walked all day on the hills and along the creeks in this vicinity, studying the geology. The lowest beds I find here are filled with ammonites, corals, sea urchins, pictens, costatus, and an immense oyster which did not seem to be gregarious. These fossils are imbedded in a good limestone. Great masses of this stone seem to be composed almost entirely of ammonites, some of them from two to three feet in diameter. I never saw a region where ammonites were so superabundant. The old seas here were literally crowded with them. Next above the ammonite bed comes a deposit of dark clay, filled with crystals of sulphate of lime, and containing many nodules, enclosing what appears to be the fruit of nut-bearing trees. This deposit also contains a few minute shells, which as far as I could judge are fresh-water. Above this comes a thickness of a few feet composed of grypheas, ostna lava and a few small ammonites. With this deposit the ammonites disappeared from the world, and the few that then existed were small and feeble indeed, compared with the monsters that preceded them. These gryphea beds are not well consolidated and you can rake up the shells by the car load in a very little altered condition. Above the grypheas comes a bed wholly composed of little ostna whose name I do not know. This bed is not at all consolidated and is only a foot or two in thickness. It closed the Cretacious epoch. Above this comes a hard stone of the Tertiary age—a limestone, very hard and making an excellent building stone. It has few fossils, and these so hard to get at that I am not able to identify them. I found in the gryphea beds a beautiful piece of fossil siggillaria. It was imbedded with the grypheas. This seemed to me strange, but I could not well be mistaken. This and some other things that I have noticed in Texas geology makes me think that the cretacious and carboniferous deposits of Texas are much closer of kin than those elsewhere—in fact, that the carboniferous projected many of its forms and characteristics into the cretacious. But it is possible that this piece of siggillaria might have been drifted in a fossil state into the gryphea beds; for the carboniferous is distinct only about 40 miles above here.

Mr. Munson, who accompanied me on this tramp, is a nurseryman of Denison, and a Michigander. He says there is no country like this for fruits and grapes, and blesses his stars that ever he came to Texas. If any Northern man would like to get the honest convictions of a Northern man in regard to this country and its capacities I would recommend him to write to Mr. Munson.

There is game in great abundance here, particularly just across the river in the "beautiful Indian Territory," where there is probably not one human being to ten square miles of territory. The game is deer, turkeys, geese, ducks, swans, squirrels, quail and almost everything else you can think of. The sportsman can get his fill here. Hence I "go West young, man;" and if these presents be good there will be more coming.

Denison, Texas, Jan., 1880. N. A. T.

CAT BIRD EATING A SNAKE.—A correspondent who writes to us from Germantown, Pa., over the signature L. D. S., sends us the following curious note of his personal observation. He says:—

I send you an account of a young cat bird swallowing a snake, or rather trying to do so. Back of our house there is a clump of blackberry bushes, and in these bushes a cat bird had been in the habit of building her nest for several years past. One day in June, 1877, I heard the cat bird making a great row, and saw her flying about her nest in great distress over something. I went up to the nest and discovered that one of the little cat birds, which hardly had its eyes open, had swallowed a garter snake about ten inches long. Fully six inches of the snake protruded from the bird's mouth, and the poor bird was unable to get it up or down. It was almost dead, and it seemed very glad to be relieved of its dinner. This is the first time I ever knew cat birds to eat snakes.

Natural History.

MINNESOTA BIRDS.—We acknowledge with thanks the receipt of a copy of Messrs. Roberts and Benner's interesting list of the summer birds of Grant and Traverse Counties, Minn., to which we recently referred in our notice of the January *Bulletin* of the Nuttall Ornithological Club.

TAKING PLASTER CASTS OF SPECIMENS.—No description of the process of making plaster casts has ever been published. The general method, which of course is varied by the ingenuity of the workman in almost every case in which it is applied, is as follows:—The fish, or other object, is placed upon a smooth table, a surface of glass or stone being preferred; and is propped up in a natural position with masses of modeler's clay. If the object is smooth and with regular outlines the mold may usually be made in a single piece; but if it be irregular in shape like a snake, it is necessary to arrange for a sectional mold, which is made by means known to every modeler. To make the mold, whether it be a single mold or piece mold, the object is covered with a thick solution of plaster of paris in water, a small proportion of glue being sometimes added to cause the plaster to set with greater firmness. The plaster being set, the object is withdrawn, leaving a mold. This mold is then coated with shellac dissolved in alcohol; and into the cavity of the mold a solution of plaster is poured in such a way as to form a coating over the whole interior of the mold from an eighth to a fourth of an inch. As soon as this is dried, other layers are made until a deposit of an inch or more is placed over the entire inner surface of the mold. After the plaster has become sufficiently hard the mold is chiseled away, leaving an exact fac-simile of the object. To facilitate this process of chiseling, the first layer of plaster poured into the mold is often tinted, so that the chisler runs no risk of cutting into the cast. The cast is now complete and ready for mounting and painting. It may be mounted upon a board by means of screws, or may be set into a bed of plaster which is tinted to any color which may be desired for a background, and framed in wood. The object itself (*i. e.*, the cast), is sized with a solution of glue and is then ready for painting. This is done in oil colors, either from a sketch prepared from the fresh specimen, or from the specimen itself if this retains its color sufficiently to be serviceable. Glass eyes are often inserted, since it is difficult to obtain the desired brilliancy by paint. To make the plaster casts is quite as much an art as to paint or embroider well, and can only be properly learned through the instruction of an expert.

THE PILEATED WOODPECKER IN CANADA.—The pileated woodpecker, perhaps better known as the "black cock," and by some the "wood cock," is by no means a rare bird in Canada, although it is never seen very close to towns or cities. It is a tolerably common species in the heavily timbered sections along the rivers Madeswaska, Bonnechere, and upper portion of the Ottawa River in Ontario, and is abundant throughout the Gatenian and du Lievres River districts in Ottawa County, Quebec. In each of these regions the birds are resident and nest, but are more observed and met with during the winter months, as they do not so much confine themselves to the denser forests. They are often met both at Montreal and Quebec in winter and are exposed for sale in the markets. I have obtained a number of fine specimens thus exposed for sale. In skinning these woodpeckers, considerable difficulty is experienced in passing the skin of the neck over the skull, as this last is unusually large, and most taxidermists are obliged to make an incision in the neck ere the skull can be bored and the brain extracted. This woodpecker possesses great power in neck muscle, and on a still day its rappings and chopping may be heard a very long way off; but this, of course, depends very much upon the nature of the tree it is working at, and whether this is hollow or solid. HENRY G. VENNOR.

Montreal, Jan. 3d.

FOOD OF ALLIGATORS.—*Houston, Texas, Dec.* 8th.—In volume XIII, No. 18, of FOREST AND STREAM, "Wanderer" says in his alligator notes:—"They will eat anything that has life and flesh, except a snake." Now my experience based on frequent observation is: they will eat anything that is flesh, snakes not excepted.

Roaming along the coast of Texas, along the Red River, Sabine, Trinity and other streams full of alligators, and last year during a three months' stay in the marsh lands on Vermillon Bay of Louisiana, I saw them swallow repeatedly, with the same appetite, fishes, fowls, pieces of raw and cooked meat, crabs, bivalves, gray water snakes (*Hydra*), and the poisonous mocassin (*Toxicophis piscivorus*), etc., etc. Further, Mr. E. F. Schmidt, in Houston, Texas, has an aquarium and vivarium in one of the show windows of his drug store, in which, besides fishes, turtles and horned frogs, were thriving a numerous and lively set of lizards and snakes of all descriptions. Last spring to this gentleman were sent some young alligators (about ten inches long), which also were set in the window, and, though regularly and abundantly fed with raw meat and minnows, after about two weeks had cleared out all the lizards and snakes (some of the latter being over two feet long), but never touched a turtle as long as it was alive. And as often as snakes of various kinds, poisonous and non-poisonous, afterwards were set in the window, the young alligators immediately commenced hunting after them, and generally half an hour afterwards one of them had swallowed the snake, head foremost, the tail hanging out of the alligator's mouth, wriggling still; after about fifteen to twenty minutes the whole snake had disappeared. W. H. ST——Z.

THE ELECTRIC EEL.—M. Marcy, who has been for some years engaged in the study of these very singular aquatic animals, has announced to the Academy of Sciences that he has received a living specimen of the *gymnotus* or electrical eel from Peru, and that it is lodged in his laboratory at the Collége de France, where by-the-bye, any visitor is admitted to inspect it. The *gymnotus* is that peculiar fish which at its pleasure gives electrical discharges, and thereby stuns the animal it desires to make its prey. Its principal home is in the rivers and lagoons of South America, where it is the terror of all other animals, not even excepting the cayman, the American crocodile. One of these eels, two metres in length, can give a shock which will reduce to powerlessness the oxen and horses that come down to the stream to drink at the points it frequents, and thus render them an easy prey to their aquatic enemies. Man himself, although not so sensitive to the shock as other animals, is still liable to very serious inconvenience from its effects. M. Marcy has found, during his investigations, that a *gymnotus* of a metre in length has an electrical surface of about 600 square feet, equal to a very powerful battery. The animal, owing to its length and the suppleness of its body, can produce different electrical effects according as it is in a straight line, convex, or concave, as regards it prey. Its general mode of procedure is to form a semi-circle and place the fish it is intent on in the diameter of the circuit. When the discharge is delivered, the prey, as if struck by a thunderbolt, is rendered powerless; the *gymnotus* swims round it, as if to be assured of the efficacy of the shock, and then swallows its victim. These are not the only fish which possess this singular power of launching electrical discharges on their prey or on their enemies. Many others are known, but far inferior in force to the terrible *gymnotus*. Among them are the torpedo fish, and some species of skate which inhabit the coasts of Great Britain and France, and some other species found in the Nile and Senegal.—[*Galignani.*

BLACK-SNAKES, ANCIENT AND MODERN.—*Cleveland, O., Jan. 26th.*—I left out one paragraph relative to Father Hennepin's blacksnake. The Father's black-snake story was written over two hundred years before mine, and this accounts for the difference in the length of our black-snakes. DR. E. STERLING.

COB-WEB SHOWERS.—A Bethel, Me., correspondent, says:—"In your last a query was propounded, where the cob-webs came from? There is a very small spider that is in the habit of spinning a long thread, and buoyed up by it, of taking long sails through the air. They have been met with, floating over the Rocky Mountains, by United States Survey officials, although I cannot state for certain which one; it might have been Marcy. I should suppose the vast numbers spoken of possibly arose from it being their mating season.

THE BIRDS OF CHESTER COUNTY, PA.

BY B. HARRY WARREN.

The technical names employed in the following list are those used in the Smithsonian Catalogue of North American Birds.

An asterisk prefixed to the name of any species shows that it has been recorded by Vincent Barnard in A Catalogue of the Birds of Chester County, Pa., published in a Smithsonian Report for the year 1860.

Names marked with a † indicate that they have been compiled from a paper prepared by Dr. E. Michener, Avondale, Pa., and published in an Agricultural Report of 1863.

I have been informed through several sources that the great grey owl (*S. cinereum*), hawk owl (*S. ulula*), Philadelphia; Vireo (*V. philadelphicus*), yellow rail (*P. noveboracensis*), and least bittern (*Ardetta exilis*), have occurred in Chester County; but lacking as material evidence, have not incorporated them:—

1. *Cathartes aura*, Illig—Turkey buzzard; casual winter resident. I. Hoopes Matlack, of Westchester, found one nest near Parkesburg, Pa. By the writer two nests have been taken within a few miles of West Chester, Pa.

2. *Falco anatum*, Bonaparte—Duck hawk; very rare. Two specimens taken in Chester County are now in the cabinet of Harry Ganett, Willistown, Pa.

3. *Hypotriorchis columbarius*, Gr.—Pigeon hawk; is a winter resident, and one of the rare raptores.

4. *Falco islandicus*, Sabine—Jer. falcon. The occurrence of this bird in the county is unique. The capture of this beautiful falcon occurred some winters ago when the sportsmen of West Chester and vicinity offered a premium of 25 cents a head for all large hawks.

5. *Tinnunculus sparverius*, Vieill—Sparrow hawk; abundant resident; two broods reared.

6. *Astur atricapillus*, Bonap.—Goshawk; winter visitant; rare.

7. *Accipiter cooperii*, Bonap.—Cooper's hawk; abundant winter resident.

8. *Accipiter fuscus*, Bonap.—Sharp-shinned hawk; resident but not plentiful; most abundant in spring and fall.

9. *Buteo borealis*, Vieill—Red-tailed hawk; abundant resident.

10. *Buteo lineatus*, Jardine—Red-shouldered hawk; winter resident. The following is an extract from a letter received by myself from W. E. Hughes, of Phœnixville, Pa.: "The red-shouldered hawk eggs, two in number, were taken in East Pikeland Township, Chester County, Pa., but in what year I am wholly unable to say. The female was shot and identified." As I am now informed, this is the only occurrence of *lineatus* breeding within the confines of Chester County.

11. *Buteo pennsylvanicus*, Bonap.—Broad-winged hawk; rare resident.

12. *Archibuteo lagopus*, Var. *Sancti-Johannis*, Ridgway.—Rough-legged hawk; very irregular winter resident.

13. *†Ictinia mississippiensis*, Gray—Mississippi kite; "very rare."

14. *Circus hudsonius*, Vieillot—Marsh hawk; appears in spring and autumn as a migrant in limited numbers.

15. *Aquila canadensis*, Cassin—Golden eagle; rare; migrant.

16. *Haliœtus leucocephalus*, Savigny—Bald eagle; not uncommon in spring, fall and winter. About the year 1839 Mr. B. M. Everhart, of West Chester, Pa., found within the present boro, limits of West Chester a nest with one eaglet therein, which he took and kept some years.

17. *Pandion carolinensis*, Bonap.—Fish-hawk; rather numerous along the Brandywine Creek. Arrives in April and departs in October. For several years past a pair of these birds have taken summer residence along the stream above mentioned. I have been told by a collector that twice he has found fish-hawks' nests containing young.

18. *Strix pratincola*, Bonap.—Barn owl; rare. Occurs early in spring and in fall and winter.

19. *Bubo virginianus*, Bonap.—Great horned owl; resident; well distributed throughout the country.

20. *Scops asio*, Bonap.—Screech owl; abundant resident. Since the introduction and alarming increase of the house sparrow, these owls have resorted in increased numbers to our boro. (West Chester). The havoc which they occasion in the ranks of the English sparrow should forever recommend them to the protection of the communities.

21. *Otus wilsonianus*, Lesson—Long-eared owl; as a resident, rare. During winter, gregarious and abundant.

22. *Brachyotus cassini*, Brewer—Short-eared owl. When it occurs in winter, which is seldom, is found in parties of from five to twelve. This species Michener records as "resident, frequent in winter, rare in summer."

23. *Syrnium nebulosum*, Gray—Barred owl; winter resident, but never common.

24. *Nyctale acadica*, Bonap.—Saw-whet owl; rare winter visitant.

25. *Nyctea nivea*, Gray—Snowy owl. During particularly hard winters, a few specimens are captured.

26. *Coccygus americanus*, Bonap. Yellow-billed cuckoo; common, but not as plentiful as succeeding species. Two broods; arrive, April 28th to May 10th.

27. *Coccygus erythrophthalmus*, Bonap.—Black-billed cuckoo; abundant. Two broods; arrive May 5th to 16th.

28. *Hylotomus pileatus*, Gray—Pileated woodpecker; accidental.

29. *Picus villosus*, Linn.—Hairy woodpecker; resident; moderately abundant.

30. *Picus pubescens*, Linn.—Downy wood-pecker; abundant; occasionally two broods.

31. *Picus borealis*, Vieill—Red-cockaded woodpecker; "accidental; very rare."

32. *Sphyrapicus varius*, Baird—Yellow-bellied woodpecker. In spring and autumn is abundant, but has never been observed by the writer during winter.

33. *Centurus carolinus*, Bonap.—Red-bellied woodpecker; rare; spring, fall and winter visitant.

34. *Melanerpes erythrocephalus*, Swainson—Red-headed woodpecker; common; rears two broods; in mild winters, resident.

35. *Colaptes auratus*, Swainson—Flicker; abundant; rears two broods, sometimes three; generally resident.

36. *Trochilus colubris*, Linn.—Humming bird; irregularly abundant. Arrives May 8th to 15th.

37. *Chætura pelasgia*, Stephens—Chimney swift; abundant; two broods; arrives April 22d to 30th.

38. *Antrostomus vociferus*, Bonap.—Whip-poor-will; not numerous; arrives April 23d to May 1st; rears two broods.

39. *Chordeiles popetue*, Baird—Night-hawk; abundant; arrives May 4th to 8th.

40. *Ceryle alcyon*, Bole—Belted king-fisher; quite numerous; resident mild winters, March 10th to 25th.

41. *Tyrannus carolinensis*, Baird—King bird; abundant; arrives April 26th to May 1st; rears two broods.

42. *Myiarchus crinitus*, Cab.—Great-crested flycatcher; abundant; arrives May 5th to 15th.

43. *Sayornis fuscus*, Baird -Pewee; abundant; arrives March 11th to April 15th; rears two broods.

44. *Contopus borealis*, Baird—Olive-sided flycatcher; rare, migrant; May 1st, 1884, a specimen was taken near Coatesville, Pa., by O. D. Wood, of Philadelphia.

45. *Contopus virens*, Cab.—Wood pewee; abundant; May 8th to 15th.

46. *Empidonax traillii*, Baird—Traill's flycatcher; occurs as a migrant; rare.

47. **Empidonax minimus*, Baird—Least flycatcher; arrives May "10th to 15th."

48. *Empidonax acadicus*, Baird—Green-crested flycatcher; abundant; May 5th to 12th.

49. **Empidonax flaviventris*, Baird—Yellow-bellied flycatcher; "May 8th to 14th."

50. *Turdus mustelinus*, Gm.—Wood robin; abundant; arrives April 19th to May 1st.

51. *Turdus pallasi*, Cab.—Hermit thrush; common migrant; arrives April 25th to May 7th.

52. *Turdus fuscescens*, Stephens—Tawny thrush; common migrant; arrives April 7th to 25th.

53. **Turdus swainsonii*, Cab.—Olive-backed thrush; migrant; arrives April 24th to May 4th.

54. *Turdus migratorius*, Linn.—Robin; abundant; rears two broods; sometimes winters with us.

55. *Sialia sialis*, Baird—Blue-bird; abundant; resident in early spring, autumn and winter gregarious.

56. *Regulus calendula*, Licht—Ruby-crowned kinglet; abundant; migrant; arrives April 4th to 21st.

57. *Regulus satrapa*, Licht—Golden-crowned kinglet; abundant during early spring and latter part of fall; winter resident.

58. *Anthus ludovicianus*, Licht—Tit-lark; winter resident.

59. *Mniotilta varia*, Vieillot—Black and white creeper; migrant; arrives April 29th to May 1st.

60. *Parula americana*, Bonap.—Blue-yellow-backed warbler; abundant; migrant; arrives May 1st to 10th.

61. **Protonotaria citrea*, Baird—Prothonotary warbler; "rare."

62. *Geothlypis trichas*, Cab.—Maryland yellow-throat; abundant; arrives May 5th to 12th.

63. *Geothlypis philadelphia*, Baird—Mourning warbler; rare; migrant; arrives May 3d to 15th. Specimens of this species have been taken by Harry Ganett, of Willistown.

64. **Geothlypis tephrocotis*, Cab.—Michener's warbler; "rare." This species, if in existence, I have never seen. Dr. Michener is inclined to look upon it as *O. agilis*.

65. *Oporornis agilis*, Baird—Connecticut warbler; migrant; rare in spring, but rather common in autumn.

66. *Oporornis formosus*, Baird—Kentucky warbler; abundant; arrives April 23th to May 8th.

67. *Icteria viridis*, Bonap.—Yellow-breasted chat; common; arrives May 2d to 9th.

68. *Helmitherus vermivorus*, Bonap.—Worm-eating warbler; not abundant; arrives May 2d to 13th.

69. *Helminthophaga pinus*, Baird—Blue-winged yellow warbler; moderately abundant; arrives May 6th to 12th.

70. *Helminthophaga chrysoptera*, Baird—Golden-winged warbler; rare; migrant; arrives May 1st to 12th.

71. *Helminthophaga ruficapilla*, Baird.—Nashville warbler; not abundant; arrives May 1st to 10th.

72. *Helminthophaga peregrina*, Cab.—Tennessee warbler; migrant. I never saw this warbler in the spring, but have taken specimens in the fall.

73. *Seiurus aurocapillus*, Sw.—Oven bird; abundant; arrives April 20th to 26th.

74. *S. noveboracensis*, Nut.—Water thrush; migrant; arrives April 19th to 24th. Have taken this species in June, and from this fact think they breed.

75. *S. ludovicianus*, Bonap.—Large-billed water thrush; rare; migrant.

(*To be continued.*)

Fish Culture.

DOES THE ATLANTIC SALMON SPAWN IN THE SPRING AS WELL AS IN THE FALL?

THE habits of the salmon, like those of other food fishes, become modified by climate. It is unwise to generalize with any certainty of expression respecting a creature which is enabled to adapt itself to rivers only occasionally frozen over above tide-water, and the frigid streams of the Northern Labrador, which are often ice-bound for eight months in the year, and where the sea is frozen for miles outside of the estuary or bay into which they debouch.

Eagle River, emptying into Sandwich Bay, Labrador, in latitude 53 deg. 33 N., has been a noted salmon fishing station for more than a century. It is still wonderfully productive, as are many other rivers on that coast lying further to the north. Eagle River rarely opens before the 1st of June, and closes again in October in its upper reaches. The bay takes in December or early in January. Salmon River, in Frobisher Bay, in latitude 68 deg., is still more ice-locked, and yet abounds in salmon. The rivers in Ungava Bay are noted for their salmon, yet they are ice-bound for more than six months.

Stationary and floating ice has been, and is still, the great natural protector of the salmon rivers in British America waters. Had it not been for the difficulties and dangers attending the setting of salmon nets and stake-weirs in the early summer, arising from floating ice, many salmon rivers emptying into the Gulf of St. Lawrence and the Atlantic, on the coast of the Northeastern Labrador, would have been depopulated long ago, like those on the Upper St. Lawrence above Quebec. But the descending ice in the spring freshets, together with the shore ice, practically introduces a close time, and permits a certain number of fish to pass up before the nets can be set. But the ice may have exerted in Northern rivers another influence, and protected the salmon by inducing habits suitable to the conditions under which this fish very successfully maintains its existence in great force where ice most prevails. This habit is the spring spawning of salmon under the ice.

The conditions accompanying the life of *Salmo salar* on the coast of Newfoundland and Atlantic Labrador indicate of themselves a necessary growth of adaptation to surrounding conditions.

The mean time observed by Cartwright* of the first appearance of salmon in Sandwich Bay (latitude 53 deg. 50 min.) in a series of observations extending over seven years, was the 21st of June. The earliest spring arrival recorded was June 3d; the latest July 3d. Still further to the Northwest, at the extremity of the deep fiords in the vicinity of Ukkasiksalik (latitude 55 deg. 55 min. N.), I was informed in 1876 that the salmon is always looked for by the Esquimaux on the day of the first spring tide after the middle of July, and not before that date. Between Sandwich Bay and Ukkasiksalik there are many salmon rivers and salmon fishing stations, in a distance of about 360 miles, and the mean time of the salmon's first approach to the coast *after* the rivers open lies between June 21st and July 16th, covering a period of twenty-five days, being later and later as we move toward the northwest. After leaving Fern Bay (Okpact), some fifteen miles northwest of Ukkasiksalik, salmon are rarely found on the coast until Ungava Bay is reached, because the rivers, descending from mountains which approach close to the coast line, are not suitable for salmon between Fern Bay and Cape Chidley, at the entrance to Hudson Straits. But in Ungava Bay, where the rivers come from the far interior of Labrador, and are large, salmon reappear in extraordinary numbers.

The rivers on the Atlantic Labrador freeze over in November, and sometimes in October. Throughout the winter they are fed by a limited drainage which lies above perpetually frozen soil, at a depth varying from four to seven feet from the surface.

The feeding springs and swamps must be nearly ice-cold for six months at least, and the drainage is of the temperature of melting snow, or nearly so, for about eight months in the year. The temperature of the water under the ice in the rivers cannot be more than two or three degrees above the freezing point of water until they open, and in summer the waters are warm only for a very brief period. Upon the supposition that one variety of the salmon spawn in September, the eggs (on shoals) will be exposed to a temperature generally below, and but rarely above the freezing point of water for a period of at least 150 days after the month of October has passed. This period of exposure to low temperature under ice will sometimes extend to 180 days, and in the case of an early fall and a late spring, to 190 to 200 days. If a variety of *Salmo salar* spawned in March or April, under the ice, the eggs would hatch in July and August, giving them a period of 100 to 120 days; the fry would remain in deep pools during the winter, and descend to the sea in the following summer at the age of about fifteen months.

The question arises whether there is any evidence that *Salmo salar* has not been able so to adapt its habits to the climatal condition of some of the Labrador and Newfoundland streams, that its spawning season has become adapted to those conditions, and that there may be two varieties, or rather two classes of salmon there, the spring spawning and the fall spawning salmon. It is stated by fishermen on the Newfoundland coast and the Labrador, that they have taken salmon with ripe spawn in them early in the spring. But something more is wanted than replies which meet a wished for case. This is provided in a well authenticated instance, officially recorded in the journals of the Newfoundland House of Assembly for 1856, and as the record is interesting and precise, I give it in full:

"In the month of March, 1835, I received a fresh salmon as a present, which was taken the day previous in salt water. It contained spawn of a large size, quite transparent, so that it might be presumed its time for shedding had arrived. In November, 1841, thirty salmon were taken at one haul in a fresh water brook, at about three miles in the country. All of them were shedders, and one which I bought contained spawn as nearly as possible in size and transparency to the one above described, and its flesh, like that of the other, unfit for use." This letter was dated and signed, "Jos. Blackburn, Magistrate's Office, Grand Bank, 3d Nov., 1856." Grand Bank is on the south side of Fortune Bay.

Now we know from Mr. B. B. Redding* that the California salmon (*Salmo quinnat*) spawn in the upper reaches of the great rivers flowing into the Pacific in October and November; also that there is another spawning period in the small coast rivers in January and February. These coincidences between the habits of *Salmo quinnat* on the Pacific coast and the alleged habits of *Salmo salar* on the Atlantic coast are so striking as to leave little room for doubt that the Atlantic salmon, under the influence of different conditions, spawns in the spring as well as in the fall in suitable rivers.

But there are other reasons apart from those advanced which render it probable that spring spawning is a habit induced by climatal conditions, and not an accidental occurrence in the case of a few individuals. On the Atlantic coast of Newfoundland salmon are not unfrequently taken in the sea until late in November. They are found cast up on the beach after Christmas, and instances are known of their having been taken in seal nets during the winter, showing that they are then on the coast. In Nova Scotia we frequently have salmon in February in the Western rivers. In the Rhine the "winter salmon" is a common fish and eagerly sought after on account of its fatness, but in all these recorded instances there is no mention made, as far as I am aware, of the spring spawning habit. They visit the rivers, but not always for the purpose of spawning, as far as known; still there is nothing which presents itself to my mind as fatal to the view that under more prolonged conditions of ice and low temperature schools of this fish should not acquire the habit of spring spawning.

With reference to the runs of this fish in salt water I may mention that in Newfoundland and also on the Labrador, the headland fishery with nets is first pursued in the spring. According to an official statement made by the Stipendiary Magistrate of the Burin District in Newfoundland (Placentia Bay) in 1856 the following results were then observed:—"For the last ten or twelve years the salmon fishery has been prosecuted by placing nets off the headlands and along the shore and small coves exposed to the sea; in these situations it commences about the 13th May, and a large description of fish is taken, weighing from 12 to 25 lbs., and in one or two instances up to 35 lbs. each, and nets of 6 to 7 inch mesh are now required. These large salmon are always going to the southwest, and disappear about the 20th to the 25th of June, when salmon of from 4 to 10 lbs. are taken during a month or five weeks after, with nets of a much smaller mesh, and whatever salmon may be taken in sheltered arms or bays, *or about the brooks*, are all of this description, for the large and first run of salmon *are never taken* but in situations exposed to the sea." May not this large run of fish taken in May and June be those which have spawned under the ice in February or in March, in such rivers as were accessible to them when frozen over. It is also to be observed that the salmon precede the caplin generally by about 12 to 14 days, and the salmon then caught about headlands are frequently found to be gorged with caplin. This shows that the caplin are at that period in deep water not remote from the coast, and that the salmon feeding on them are in a very different condition to those which are taken in river estuaries, without any food in their stomachs, and preparing for the development of their spawn in fresh water, as commonly supposed, or seeking fresh water to free themselves from parasites.

I think it is evident that if the habit of spring or winter spawning among certain schools of *Salmo salar* can be practically verified, and the variety secured, its artificial introduction might be attempted in other rivers than those of Newfoundland, the Labrador, and perhaps even Nova Scotia. The successful introduction of a spring spawning variety might make a supply of this splendid fish available at seasons during which it is at present either inaccessible or not fit for food.

Sea and River Fishing.

FISH IN SEASON IN JANUARY.

SOUTHERN WATERS.

Pompano, *Trachinotus carolinus*.
Drum (two species). Family *Sciænidæ*.
Kingfish, *Menticirrus nebulosus*.
Sea Bass, *Sciænops ocellatus*.
Sheepshead, *Archosargus probatocephalus*.
Grouper, *Epinephelus nigritus*.
Trout (black bass), *Centrorpristis atrarius*.
Striped Bass, or Rockfish, *Roccus lineatus*.
Tailorfish, *Pomatomus saltatrix*.
Black Bass, *Micropterus salmoides*:

Red Snapper, *Lutjanus blackfordii*.

GAME AND FISH DIRECTORY.

In sending reports for the FOREST AND STREAM Directory to Game and Fish Resorts, our correspondents are requested to give the following particulars, with such other information as they may deem of value: State, Town, County; means of access; Hotel and other accommodations; Game and its Season; Fish and its Season; Boats, Guides, etc.; Name of person to address; after the following model:—

NEW JERSEY.—*Forked River*, Ocean Co.—Reached via New Jersey Southern Railroad; time, 3½ hours from New York City. Riverside House, A. H. Corwin; $2 per day, $8 to $10 per week. Open all the year. Superior accommodations for families. Has a billiard-room, no bar. *Game.*—Ducks, geese and brant, from Nov 1st to May 1st; bay birds after July 1st; quail and Wilson's snipe, Nov. 1st to Feb. 1st; woodcock after July 3d. *Fish.*—Bluefish, June 1st to Nov. 1st, weak fish, sea bass, king fish and sheepshead, all summer. Guides, with dog, $1.50 per day. Boat, with man, decoys, etc., $2 and $3 per day. Address as above. Further particulars and photograph of place can be seen at office of Smith & Lawrence, 44 West Broadway, New York.

ARKANSAS.—*Jacksonport*, Jackson Co.—Reached by St. L. I. M. & S. Ry., or by boat from any point on the Mississippi or tributary rivers. *Game.*—Snipe, plover, ducks, geese, quail, turkeys, deer, and bear. No end of squirrels, coons, 'possums, rabbits, etc. *Fish.*—Black bass, two sorts; striped bass, two sorts; pickerel,

Ohio River salmon, speckled perch, red perch, goggle-eyed bream, and more than are wanted of sturgeon, shovel-nosed and plain drum, buffalo, suckers, and all sorts of cat fish. No guides needed, nor to be had. Plenty of company, if required. Boats on borrower's own terms. Hotel—Redman House, Mrs. J. C. Redman, proprietor; terms, $8 per week; none better any where. Address Chas. E. Thorne, as above.

A LODGE IN THE WOODS.

HACKENSACK, N. J., *Jan.*, 1880.

—*Editor Forest and Stream*:—Together with three boon companions and an occasional visitor, I have spent from fifteen to twenty days each season for the last ten years trout fishing in the wilds of Sullivan County, N. Y., using a tent for shelter. Cold storms, frosty nights and the cost of transportation of tents have rather destroyed the romance of life under canvas, and forced the conclusion that a shanty would be preferable. Have watched number after number of the FOREST AND STREAM with the hope of finding some suggestion that would enable me to fix upon some cheap plan of construction and arrangement that will afford comfortable accommodations for six—the kitchen, of course, not to be forgotten. Your experience will certainly afford a suggestion. Be kind enough to give the desired information through the columns of FOREST AND STREAM. A. D. C.

The wisest plan to adopt in such a case as this would be to secure the services of an experienced woodsman, either trapper or lumberman, who has built his own cabins. If such a man cannot be found, however, our friends may, with a sharp axe and a very limited amount of ingenuity, build their own lodge. A simple log cabin will be all required, and the materials are almost all to be found on the ground.

Select a level site for a building, 10x12, and about six feet high. Cut logs eight or ten inches in diameter, half of them twelve feet in length, the other half ten feet; eighteen or twenty of each will be sufficient. Cut notches at each end, so that when built up, the ends lopping over each other and secured by the grooves, the edges of the logs will touch as nearly as possible.

Windows and doors may be provided by sawing out spaces for them, securely nailing up heavy slabs for the jam. These should serve also to support the sawn logs, and must therefore be strong. When the four walls are of the desired height the roof should be formed thus: Across the top of the frame lay two of the twelve-foot logs, each two feet towards the centre from the outside. Fit into notches the same as before, and across these in turn lay two of the eight-foot logs, parallel with and above the ten-foot logs of the end. Then two more of the twelve-foot logs, each one foot nearer the centre, and upon these another set of eight-foot logs. Upon these in turn two more of the twelve-foot logs, one foot nearer the centre, and upon them the cross-pieces, six feet long. Then place a log in the centre for the ridge pole, and having marked the slant of the roof, proceed to hew off the ends of the cross-pieces with the required angle. The roof may be constructed of bark, or it may be, what is better, a trough roof. For this split and hollow out bars or similar logs; lay these, two with trough up and a third with trough down, overlapping them; secure with nails at ridge pole and eaves log, and run a large trough over the ends at the ridge pole. A small camp-stove with projecting pipe will be found more convenient than a fireplace; but if the latter be desired it may be constructed of logs, well covered with clay.

All the crevices between the logs of the walls and in the roof should be filled up with moss, dried grass and clay. The floor may be made of split logs, and for beds build bunks in tiers.

We should be glad to have some of our veteran woodsmen describe the cabins constructed by themselves. Experience suggests many little acquisitions and conveniences which the novice gladly avails himself of.

The Canadian *cabane* is thus described by the Earl of Dunraven:—

Having selected a level spot, make four low walls of two or three small pine logs laid one on the other, and on these raise the frame-work of the camp. This consists of light thin poles stuck into the upper surface of the logs, and the upper ends leaning against and supporting each other. The next operation is to strip large sheets of bark off the birch trees, and thatch these poles to within a foot or two of the top, leaving a sufficient aperture for the smoke to escape. Other poles are then laid upon the sheets of birch bark to keep them in their places. A small doorway is left in one side, and a door is constructed out of slabs of wood or out of the skin of some animal. You next level off the ground inside and strew it thickly with the small tops of Canada balsam fir for a breadth of about four feet; then take pliant ash saplings and peg them down along the edge of the pine tops to keep the carpet in its place, leaving a bare space in the centre of the hut, where you make the fire.

LAKE ST. CATHERINE, VT.—*New York, Jan.* 23*d.*—I have taken your paper for the past eighteen months, and am surprised that very little is said of Vermont as regards fishing. Six miles from Poultney, Vt., is a body of water called Lake St. Catherine, or Austin Pond. If any of your readers want good perch, bass, or pickerel fishing, let them go there in season and they will come away well satisfied. Trout fishing very good, but fish small. On the south end of the lake is situated the Lake St. Catherine House, kept by Mr. Oliver Reynolds, and it is the only place I ever put up at that I did not come away from broke. Mr. Reynolds does not charge for his boats, and a guide is always on hand to furnish bait and row you to the grounds for whatever you may give. Hotel is beautifully situated in the Green Mountains, and is first class. H. C. W.

A YANKEE FISH-CHARM.

CAMDEN, N. J., *Dec.* 31*st.*

If, as I hope, the competition is to be confined to perpendicular facts, count me in. About forty years ago I had a grandfather living in a little valley village of the Green Mountains. At the time to which I refer he was about seventy-six years of age—a vigorous, wiry, energetic old man. Less than a year before he had married his third wife, a buxom old maid of forty. The old gentleman was the village shoemaker, and in his younger days had been quite a successful gunner and fisherman, and during his latter years frequently tried the pickerel in the large, shallow, natural pond some little distance down back of the house. It was during the holidays that a nomadic Yankee came along selling recipes. The old gentleman bought one for making an improved shoemaker's wax, and one for a fish-charm, a thin paste, which, smeared upon the bait or even on a piece of rag, would persuade the fish to come out of their hiding-places and gobble said charm if within their reach. The peddler mixed up a bottle of the charm and left it hanging in the shop. Just after the usual January thaw, when the ground was nearly bare of snow, and the ice on the pond entirely so, the old gentleman took a hatchet one afternoon and crossed over the pond to the tamarac swamp after some pitch, which entered into the composition of the improved "wax." On his return he came across an arm of the pond, caused by the entrance of a small spring stream. The ice was clear, as well as the shallow water underneath, and the old gentleman was astonished to see that this little bay was literally alive with good-sized pickerel. Although it was nearly dark he determined to test his fish-charm, for the sky showed the near approach of a storm, and there was no telling when another such an opportunity would occur. Quickly cutting a hole through the ice he hastened to the shop and got his hook and line, and ruffling a small piece of cotton cloth upon the hook, dipped it into the bottle of charm, and hastened with it dripping towards the pond. Passing through the garden by the way, and breaking four or five feet off of a bean-pole, he fastened the line to it, and was soon at the hole in the ice. As he approached the hole he could see the pickerel under the ice, following him like a flock of chickens after their breakfast. Quickly swinging the line over the hole he had lowered it to within perhaps two feet of the water, when a pickerel deliberately came up through the hole with mouth wide open, and was about seizing the bait when, quick as a flash, the old gentleman gave him a crack with the toe of his boot and sent him sliding away on the surface of the ice.

He had barely replaced his foot under himself when another pickerel came out in the same way, and the old gentleman gave him a kick with the other foot and sent him also sliding away on the ice. The pickerel kept coming up and he kept cracking them first with one foot and then the other, like a raw recruit "marking time." About this time an episode was brewing up at the house, which was of more interest to the old gentleman than all the pickerel in the pond. A blast from the old tin horn struck his ear and he knew what it meant, for it was a preconcerted signal, and he ran instantly for the house; but as he did so a pickerel seized the bait and was hooked, and the old gentleman hung on to the pole and dragged him, hook and fish, over the icy ground, feeling it catch the dry weeds as he rushed ahead without looking back. As he scaled the garden fence the line dragged so heavily that he dropped the pole on the garden side and left line and fish on the other side. Stopping but a moment in the house he summoned the nearest old lady, then the Doctor, and then two more old ladies who reached the house in time to escape a heavy snow and sleet storm, which set in and lasted till midnight, leaving a crust on the snow that would bear up a horse. Before midnight, however, the writer had an aunt in that house twelve years younger than himself. The old gentleman was as tickled as Artemus Ward was over his twins, and made things lively in that house till near morning, when the women persuaded him to take some rest. He was up, however, early in the morning, but it was while at a late breakfast that he bethought himself of his pickerel. After breakfast he took his hatchet and went down to the garden fence. Tracing down along the line he cut away the crust and soon found the pickerel, frozen stiff, of course. Cutting away the ice, about two-thirds the length of the fish, he came to the head of another pickerel, the tail end of the first one being telescoped into the second one. He continued to cut away the ice and soon came to another, into which the second one was telescoped. He kept on finding the fourth and fifth telescoped in a like manner. By this time the thing was getting monotonous, so he chopped off the fifth fish, stuck a stake by it, and covered the hole with snow to keep the cats away. The families of the three old ladies, as well as that of the Doctor, had fresh fish for dinner that day, and not only that day, but at least once a week till into March. The old gentleman kept mum as to his source of supply, but went quietly every day or two, and cutting down through the crust would follow back on the line of telescoped, frozen pickerel and cut off a supply as if they were links of sausage. My grandfather was a remarkable man. He always remembered his friends. For over two months he kept a good many of them supplied with fresh fish. Finally in March there came a big thaw, and he had to dig up the rest of the line of pickerel and feed them to the hogs and hens. In tracing the line back to the hole in the ice, then frozen up, he cut out a pickerel minus his tail, which was gone close to the lower side of the ice, and thus "perfect continuity" was broken. Upon reopening the hole, however, he perceived the dorsal fin attached to the tail end of a dead pickerel, which was in the mouth of another dead one, but the ice prevented his tracing the line further back. A few days after that Yankee recipe peddler called, and the old gentleman imparted to him confidentially his great success with the "charm." They went down to the pond and fished out twenty-nine feet more of the telescoped line of dead pickerel, which, together with those already saved, made over nine hundred feet, and there was an average lap of one-third in the telescoping process. The Yankee cleaned up the twenty-nine-feet skeleton, fastened it with white shoe thread wherever it had a tendency to part, varnished and coiled it in a lime hogshead, took it to New York and sold it to Barnum, who mounted it on the wall of the old Museum in the form of a circle, with the tail-end inserted in the head-end mouth, with this legend upon the wall—circle: "Skeleton of hoop snake from Borneo." [illegible] glass case in front prevented a close inspection, and the end was not discovered till the Museum burned down.

VERITAS.

BEAVER RIVER CLUB.—The sixth reunion of the Beaver River Club took place at E. C. Barr's, Springfield, Mass., on the evening of the 16th, according to programme. The early part of the evening was devoted to rifle practice, and some very good scores were made; after which we adjourned to dinner, which was served in fine style by mine host Barr, who, being an old hunter and fisherman, knows what the boys appreciate. A jolly time ensued, enlivened with songs, toasts, and some verses read by one of the members, recalling old camp scenes and sports in the wild woods. The following officers were elected for the ensuing year: A. L. Phillips, President, Adams, Mass.; L. H. Mayott, Vice-President, Springfield, Mass.; Frank Bolles, Jr., Secretary and Treasurer, Windsor, Conn. A vote was passed to hold the next reunion at Pittsfield, Mass., some time in October and have a day's practice at the range. FRANK BOLLES, Jr.

FLORIDA—*Otter Creek, Fla., Jan.* 16th.—The season for hunting and fishing has fairly opened here now, and the guests of the Gulf Hammock House are having fine sport. Three of the guests divided, two hunting and one fishing; Capt. Wingate going with the hunters, and the colored guide with your humble servant. We started about 9 o'clock. The hunters arrived home about 2 o'clock with two fine bucks and a fine bag of quail. We arrived about one hour later with forty-five pounds of fish, an alligator ten feet eight inches long, weighing two hundred and fifty-five pounds, and a fine doe weighing a little over one hundred pounds. Our boat was a small one, only thirteen feet outside measurement, intended to accommodate two nicely. We had already caught about forty-five pounds of fine fish when we concluded we would take an alligator home with us; we did not have to wait long, for we soon saw one on the bank that suited us. We quietly stole upon him and with three well directed blows at his head we succeeded in killing him, as we supposed; so we went to work to get him into our little boat, when he gave a lively switch with his tail and struck me just above the knee, where he left a beautiful black mark and lamed me. We finally got his nose well up under the bow of the boat and hauled him all in except one fore foot, which we left hanging in the water. We were fairly under way when he concluded he wanted that foot inside, and in bringing it in he nearly capsized our boat and compelled us to ship some water. We finally had to tie his tail fast to the flooring in the bottom of the boat, as he kept continually moving it around and endangering our lives. I also tied my gun fast in the bottom of the boat, so that in case we were upset I would not lose it, not thinking that I would have any more use for it on our way home; but imagine my chagrin and surprise at seeing a fine deer standing in the Mekind River about ten paces from us, and a half-mile below the house. Before I could get my gun untied he was gone. I did not tie it again, I assure you, and we had not gone over two hundred yards before we saw another one; this time we were prepared, and brought her down handsomely. After putting the deer into the boat we were just one inch out of water, and a half mile to go, and I need not say that we did some very quiet rowing, but we arrived safe, very well pleased with our day's sport.

Dr. Kenney, of Philadelphia, and Mr. Moorehead, of New York, went out bass fishing the next day after dinner—were gone about one and a half hours and brought in about twenty-six fish, the largest weighing four and one-half and the smallest one and one-quarter pounds. Yesterday my wife and I went out sheepshead fishing. We commenced fishing about 1 o'clock and quit at 3 o'clock, when we found we had caught thirty-four, the largest weighing four and one-quarter and the smallest two pounds, the whole weighing seventy-three pounds. My wife caught the largest, and she had all she could do to land him in the boat. All are is enjoying themselves finely here. McF.

A TRUTHFUL ANGLER REJOICETH.—*N. Y. Jan.* 24*th.*—*—Editor Forest and Stream*:—The effect of the tremendous stores you have lately published on "Fish Swallowing Fish," is shown in the delicate consideration for the feelings and veracity of fishermen, evinced by our good friends Abbey & Imbrie in their current advertisement of trout baskets. Have you noticed how carefully they say (on the third line of the advertisement), "Capacity in pounds (approximate?)" That's right; approximate! Word of words for a fisherman! By all means purchase an Abbey & Imbrie trout basket; then you cannot tell a lie. Get a nine pound (approximate), or a twelve, or shall we say twenty pound (approximate?) How satisfying to the conscience to be able truthfully to say, "I brought home my Abbey & Imbrie twenty pound trout basket full." Approximate; that's it; approximate; it sounds well. Good word, that. G. W. V. S.

ST. MAURICE AND THE LAURENTIDES.

ST. ELEE, ST. MAURICE COUNTY, P. Q., *Jan.* 16*th.*

In your wanderings up and down the country, casting your line in pleasant places where the speckled beauties mostly do congregate, I doubt much if you have been rewarded as you would be by a few days spent in this charming country in early spring. I by a few days spent in this charming country in early spring. I look upon it as the future resort of the American angler. Lakes innumerable dot the surface of the country from the Saguenay in the East to the Ottawa in the West, and with but few exceptions contain game fish, principally *Salmon fontinalis*. A railroad is now in operation between Three Rivers and the "Piles," a point some thirty odd miles from the mouth of the River St. Maurice. From the "Piles" a steamer will be run some sixty miles up the river, through as picturesque a country as can be found on the continent. The fishing on the St. Maurice and its numerous tributaries is superb. Here is an opportunity for the adventurous angler to penetrate into the heart of the Laurentides.

Among the chief tributaries of the St. Maurice may be mentioned the Mekinak, Bostonnais, Croche, the latter being the route traversed by the Indians on their way to Lake St. John and the sources of the Saguenay, Frenche, Pierreiche and Wendigo, on the east; the Shawinegan, Mattawin, Wessonneau, Rat, Vermillion, Flamand and the Manovan, on the west. The latter river

s so he very [illegible] lakes at its source, and like all other lakes in is country they are swarming with fish.

One can hardly go a-miss, however, for good fishing anywhere tween Ottawa and Quebec on the north shore of the St. Lawrence. I will not excite the envy of knights of the rod by relating my ventures this fall on the Mattawin among the *Esox estor* a *Belle* [illegible] families; of how on one occasion while fishing r [illegible]ance a monster rose from the depths and disappeared ith spoon, line, rod and reel. More anon. JEAN.

The Kennel.

ANN ARBOR BENCH SHOW.

DETROIT, Mich., *Jan. 24th.*

THE bench show of dogs at Ann Arbor was held in connection with the poultry exhibition. In point of numbers and excellence of stock shown it was a success. The show opened on the 20th and was to continue for four days, but on account of bad weather was held open one day longer. The weather was fearful; rain every night and part of the time during the day, making walking almost impossible, causing a great number to remain at home. A large number of the fair sex attended after the ice had been broken by some of the most daring ones.

In Classes Nos. 1 and 2, English setters, there was no competition worth mentioning, L. F. Whitman's fine hair, Rattler and Mell, having a clear walk-away.

Class 3, Irish setters, E. H. Gillman's, Nelson had a walk-over, there being no other entries.

Class 5 was a hot class, the first place being contested by Rupert, owned by W. J. Farrar, Toledo, Ohio, and the recently imported Blossom, owned by J. S. Nivens, M.D., London, Ont., Rupert being finally given first, and Blossom, a very fine dog, second.

Class 6 was a clean walk-away for Farrar's beautiful little bitch Queen. She is as fine as silk.

Class 7 was not closely contested, first going to Marquis of Lorne, a lemon and white; and second to Grouse, a beautiful liver colored dog.

Class 9 was a complete walk-over for Gumbo, there being no other entry. Gumbo is a very handsome pointer, and will hold his own in almost any company.

First in Class 10 was hotly contested for between the beautiful liver and white bitch Jessie, owned by Ed. Warren, Ann Arbor, and the fine little lemon and white bitch Princess Louise, owned by Fred. Howson, of Windsor, Ontario, the choice of the judge finally falling on Jessie.

In Class 11 there was no competition worth mentioning, the first for both dogs and bitches going to the more than fine pair, Jack and Duck, owned by D. D. Young, Detroit, Mich.

Class 12 was closely contested, the pride of position going to a beautiful liver and white dog, owned by Prof. C. E. Franklin, of the Michigan University, at Ann Arbor—second place going to Bob, property of James Skuse, Windsor, Ont.

By the way, I will say right here that Bob is a wonderful little dog, he probably having had shot over him as much game during the past few seasons as any setter or pointer in this section of the country.

Class 13 was large, but little competition as regards show dogs. First went to Music, owned by W. D. Hayes, Hastings, Mich. Music is as fine a fox-hound as I ever had the pleasure of gazing upon. He is as clean cut as a thoroughbred race horse.

In the bitch class, first went to Fred. Weitbrechk's, unnamed. Second went to a much better specimen—J. J. Walker's Old Top. Old Top was in fearful show condition, being just on the eve of whelping, and Mr. Walker did very wrong in placing her in the show to compete for a position.

Class 14 was the hottest contested in the exhibition, and tested the abilities of Judge Long to the utmost. The pride of place lay between Rattler, owned by J. N. Dodge, of Detroit, and Lee, owned by W. D. Hayes, Hastings, Mich., first finally going to Rattler, which I considered a very just decision. Rattler and Lee are litter brothers, if I mistake not. In the bitch class Rosy got first and Ringlet second. Both are very fine.

Class 16 had only two entries, both property of C. H. Gillman, Detroit, getting first and second.

Class 19 was a poor class, first and special going to Major, owned by Samuel Crouse, Ann Arbor.

Class 20 was another poor lot, first going to Shep, owned by John Sidney, Ann Arbor.

Class 21 was full to overflowing. I think Ann Arbor must take the lead of any place in this section for raising bulldogs. It seemed to me every other one among the male natives owned a bulldog; some of them were the most ferocious looking beasts one ever set eyes on. First in dogs went to Spring, owned by J. J. Walker, and first among bitches went to Tip, owned by David Worton, Ann Arbor.

In classes for different varieties of terriers the entries were not large, but some very fine specimens were shown.

LIST OF AWARDS.

CLASS 1.—English setters—L. F. Whitman, Detroit, Rattler, first; George Keal, Ann Arbor, Snap, second; M. Manning, Ann Arbor, Tip, V. H. C.; J. E. Song, Detroit, cash exhibition; J. Hofstetter, Ann Arbor, Bismarck, H. C.; Dr. E. C. Franklin, Ann Arbor, Druid, Exhib.

CLASS 2.—English setter bitches—L. F. Whitman, Detroit, Mell, first; J. G. Sapham, Northville, Rosa, second; Dr. E. C. Franklin, Ann Arbor, Jessie.

CLASS 3.—Irish setter dogs—E. H. Gilman, Detroit, Nelson, first.

CLASS 4.—Irish setter bitches—Dr. E. C. Franklin, Ann Arbor, Jessie.

CLASS 5.—Gordon setter dogs—W. J. Farrar, Toledo, O., Rupert, first; J. S. Nivans, M.D., London, Ont., Blossom, second; J. W. Hamilton, Ann Arbor, Jack, V. H. C.; E. H. Gilman, Detroit, Judge Festus; J. H. Moore, Ann Arbor, Bosin, wrong class.

CLASS 6.—Gordon setter bitches—W. J. Farrar, Toledo, O., Queen, first; D. R. McElwain, Hastings, Daisy N., second.

CLASS 7.—Pointer dogs over 55—D. McMillan, Ann Arbor, Ben, first; C. J. A. Shaw, Ann Arbor, Grouse, second; Fred Howson, Windsor, Ont., Marquis of Lorne, first.

CLASS 8.—Pointer bitches over 55—No entries.

CLASS 9.—Pointer dogs under 55—E. H. Gillman, Detroit, Gumbo, first.

CLASS 10.—Pointer bitches under 55—Fred Howson, Windsor, Princess Louise, second; Ed. Warren, Ann Arbor, Jessie, first.

CLASS 11.—Irish water spaniel dogs—D. D. Young, Detroit, Jack, first; W. Burleigh, Ann Arbor, Spat; W. A. Hatch, Ann Arbor, Andy. Irish water spaniel bitches—D. D. Young, Detroit, Duck, first; Ed. Warren, Ann Arbor, Juno, second.

CLASS 12.—Cocker spaniel dogs—Dr. C. E. Franklin, Ann Arbor, Zip, first; James Skuse, Windsor, Ont., Bob, second; D. R. McElwain, Hastings, Nichels, V. H. C. Cocker spaniel bitches—Peter McNelly, Ann Arbor, Curly, no award.

CLASS 13.—Foxhound dogs—A. R. Hill, Ann Arbor, Dream, H. C.; Thomas Shaw, Ann Arbor, Sport, V. H. C.; J. H. Moore, Ann Arbor, Bugle, V. H. C.; W. D. Hayes, Hastings, Mich., Music, first; H. C. Garrett, Ann Arbor, Jack, second; J. J. Studer, Fort Wayne, Ind., Johnson; J. Hofstetter, Ann Arbor, Jay.

Fox-hound bitches.—J. J. Walker, Ann Arbor, Old Top, second; J. J. Walker, Ann Arbor, Speed, V. H. C.; Fred. Weitbrecht, Ann Arbor, first.

CLASS 14.—Beagle dogs—J. N. Dodge, Detroit, Rattler, first; J. N. Dodge, Detroit, Rally II., V. H. C.; H. R. Hill, Ann Arbor, Tom; W. D. Hayes, Hastings, Ripple; W. D. Hayes, Hastings, Lee, second.

Beagle Bitches.—J. N. Dodge, Detroit, Roxy, first; J. N. Dodge, Detroit, Belle, V. H. C.; W. D. Hayes, Hastings, Rill, V. H. C.; W. D. Hayes, Hastings, Ringlet, second; Chas. Stoll, Ann Arbor, Spot—Fox-hounds.

CLASS 15.—Dachsunde dogs—Dr. Stewart, Detroit, Waldeman, first.

Dachsunde Bitches.—Dr. McElwain, Hastings, Mich., Duchess, first; J. N. Dodge, Detroit, Flora.

CLASS 16.—Fox-terrier dogs—No entries.

Fox-terrier Bitches.—E. H. Gillman, Detroit, Vic, first; E. H. Gillman, Detroit, Vic II., second.

CLASS 17.—Greyhounds—No entries.

CLASS 18.—Scotch deer-hounds—No entries.

CLASS 19.—Newfoundland dogs—E. W. Coddington, Ann Arbor, Chief, V. H. C.; Saml. Crouse, Ann Arbor, Major, first and special; J. D. Coster, Ann Arbor, Censer, second; Jno. A. Nichols, Ann Arbor, Buse, H. C.

Newfoundland Bitches.—No entry.

CLASS 20.—Shepherd dogs—Jno. Sidney, Ann Arbor, Shep, first; J. A. Armstrong, Owosso, Mich., Ben, second.

Bitches.—J. A. Armstrong, Owosso, Mich., Fly, second.

CLASS 21.—Bull-terrier dogs—Chas. MacLean, Ann Arbor, Ben, V. H. C.; G. S. Pitkin, Ann Arbor, Jack; W. H. Schuyler, Ann Arbor, Jack; Thos. L. Bonner, Ann Arbor, Cub, V. H. C.; J. J. Walker, Ann Arbor, Spring, first; J. J. Walker, Ann Arbor, Herbert, second.

Bitches.—David Norton, Ann Arbor, Tip, first; J. J. Walker, Ann Arbor, Princess Louise, second.

CLASS 22.—Black and tan terrier dogs—Jake Hofstetter, Ann Arbor, Rangy, first; J. R. Johnson, Ann Arbor, Savage, second.

Bitches.—J. J. Walker, Ann Arbor, Nig, first and special.

CLASS 23.—Skye-terrier dogs—J. J. Walker, Ann Arbor, Dick, first. Bitches—Dan'l MacLean, Ann Arbor, Jessie; J. J. Walker, Ann Arbor, Sallie, first.

CLASS 24.—Yorkshire terriers. Bitches—E. H. Gillman, Detroit, Dandy, first.

CLASS 25.—Scotch terrier dogs—J. J. Walker, Ann Arbor, Sam, second; S. Butterfield, Sandwich, Ont., first. Bitches—J. J. Walker, Ann Arbor, Jennie, V. H. C.; J. J. Walker, Ann Arbor, Kate, second; S. Butterfield, Sandwich, Ont., first; D. MacLean, Ann Arbor, V. H. C.

CLASS 26.—Toy terriers—no entries.

CLASS 27.—Pugs—dog or bitch—C. B. Dunster, Ann Arbor, Buster, first and special.

CLASS 28.—Miscellaneous—C. K. Adams, Ann Arbor, Don, V. H. C.; C. S. Miller, Ann Arbor, Custer, Italian greyhound; Miss M. E. Cullen, Ann Arbor, Daisy, first, spaniel poodle; Samuel L. Jackson, Ann Arbor, Curly, first, circus poodle.

CLASS 29.—Spitz dogs—W. H. Barnett, Ann Arbor, Nix, second, R. S. Reynolds, Ann Arbor, Joe, first.

CLASS 31.—Dalmatian coach dogs—E. H. Bell, Ann Arbor, Don Cæsar, first. DRUID.

OHIO FOX HOUNDS.—*Howard, O., Jan. 1st.*—The most exciting and interesting of all sporting to me is fox hunting. The timely and wise enactment of our Legislature has caused bird hunting to come to a stand still. But now a word to my brother fox hunters who may read your valuable paper. It is now only about two years since I have taken any interest in this sport, and while I have tried hard to learn all the different points in the business, yet I feel as though I would like to hear from some old experienced hunters, and thereby ascertain how little I have learned in the past two years.

Our hounds are principally the descendants of Virginia and Kentucky stock. Our old hunters here have been very careful in breeding from their best runners, and now we flatter ourselves to think we have as good dogs as anybody.

I have a blue bitch eighteen months old the 22d of last month, that we all think will be a prodigy. I will give a description of her as taken by the boys a few days ago. She is a maltese color on the body, has white fore legs, breast, and belly, a white ring almost around her neck and white on tip of tail. She is 17 inches high, is 40 inches from point of nose to root of tail, is 16½ inches from point to point of ears; girth around the breast, 23½ inches; flank, 17 inches; length of tail, 14½ inches; girth round root of tail, 9¾ inches; distance from top of head to point of nose, 8½ inches, and weighs 33½ pounds. Her coat was as soft as any fur, and the fibers not more than one-half inch in length. When the weather began to get warm last spring she began to shed her coat, and by the middle of July her back and sides were as bare as my hand, and continued so during the entire warm season. As cold weather began to approach she began to get her coat again, and now she has as heavy a coat as she ever had. She always seemed to be in the best of health, would eat anything, and always up and a coming. She is one of a litter of six pups, two males and four females, but there are none of them that look anything like her; her grand dam came from Virginia, so I am told, was marked like her but possessed none of what we call her peculiarities. She has been in only two or three races, but showed wonderful speed and endurance. I would like to hear from some experienced breeder of this species of dog through the FOREST AND STREAM whether her points are good or bad. J. A. C.

In the wooded Buckeye State, where every fence is like unto a Jacob's ladder, we would prefer to use a small well-put-together hound, the points of which are as follows: Head small in proportion to his frame, neck thin, chest deep, legs very straight; his feet should be round, not large; his breast wide, back broad, shoulders back, elbows in, and quarters deep. The muzzle should be long, but we dislike what may be called a pointed nose. Apperley remarks that "the length of thigh discernible in first rate hounds, which, like the well-let-down hock of the horse, gives them much superiority of speed and is also a great security against laming themselves in leaping fences, which they are more apt to do when they become blown and consequently weak." Stonehenge states that the average height of the fox-hound harrier is about 18 or 19 inches, and fox-hounds, 23 to 25 inches for dog-hounds, 21 to 23 for bitches. Mr. A. Belmont Purdy's dog-hound, Life Guard, winner of first prize in the fox-hound class at the New York show of last year; stood 24 inches in height and had 30¼ inches girth.

EXTRAORDINARY FOX HUNTING.—J. Pusey Miller, of Dugdale, Pa., has been very successful as champion fox hunter of his neighborhood the present season. With his kennel of eleven extra hounds he has holed and dug out nine foxes and caught one in a fair chase. He caught one this week by running to a hole, from where he dug it out and carried it home under his arms on horseback before 11 A. M. Foxes are very plenty in lower part of Chester County, and the sport is much indulged in. SHETHAR BOZNAI.

SQUIRREL DOGS.—*Brookville, Ind., Jan. 9th.*—I have a squirrel dog that is worth half a dozen men for finding them; he is part setter and part hound, and runs with his head up like a bird dog, and when he trees them he barks a few times and sits down and waits for a person to come up. He is the best dog for coons that I ever saw; he hunts them in the same manner that he does squirrels. W. H. F.

Belleville, Ill.—"Noah Count" came very near it in speaking of squirrel dogs, if he had only said something about the color. When I was a boy I found that a poor, lean, lank, hungry, slab-sided, woe-begone-looking "yaller" dog was the best. The squirrels didn't seem to be afraid of such a looking dog, for they would generally run up the tree a very short distance, say about to the first or second limb, where they would sit and bark at the dog, making about a thousand shakes of the tail a minute, and so busily engaged trying to make out what kind of animal was at the foot of the tree that it was a very easy matter to get near enough to shoot them. C. H. A.

ST LOUIS KENNEL CLUB'S CATALOGUE.—We are in receipt of a new, well-printed catalogue of the pointers of the St. Louis Kennel Club. It contains the somewhat extended pedigree of its fine stock. All sportsmen should have a copy.

BRED.—*Girl-Glenmark*—Mr. R. T. Greene's (Jersey City Heights, N. J.) pointer bitch Girl to Mr. Wm. F. Steele's (Piermont, N. Y.) Glenmark—Mr. Orgill's Rush and Romp.

Rhue-Berkley—Mr. Thos. A. Addison's (Chelsea, Mass.) red Irish setter bitch Rhue was bred to champion Berkeley on the 9th inst.

WHELPS.—*Gipsey Girl*—Mr. Alfred W. Bennett's (Boston, Mass.) St. Bernard bitch Gipsey Girl, whelped Dec. 18th, 1879, six puppies, four dogs and two bitches, by Mr. Wm. Pierce's Jack.

SALES.—*Punch*—Mr. C. D. Moss, of this city, has purchased from Mr. H. W. Livingston imported Willoughby pug dog Punch, by Nunn's champion Baron, out of Lady Fanny, Fitz-Wigram's bitch.

NAMES CLAIMED.—*Nancy Sykes*—Mr. L. P. Child, of this city, claims the name of Nancy Sykes for his dark-brindled bull-terrier bitch, by Mr. Stannard Wood's Ben, out of Mr. E. S. Auchincloss' imported Puss; whelped Sept. 11th, 1879.

Don—Mr. Alfred W. Bennett, of Boston, Mass., claims the name of Don for his thoroughbred St. Bernard dog, out of owner's Gipsy Girl; whelped Jan. 19th, 1879. Don is now one year old, 29 inches in height, 78 inches in length, and weighs 130 pounds.

Rolfe—Mr. S. W. Hallock, of Detroit, claims the name of Rolfe for his lemon and white setter dog, whelped June 16th, 1879, out of Mr. J. N. Dodge's imported bitch Rose, by champion Liecester.

—We call attention to Mr. Fox's notice under our Kennel advertisements of six splendid dogs for sale.

—In our issue of 22d instant, in "Pointers as Field Dogs," for "Rake barking Don's pointing," should read "Rake backing Don's pointing."

Yachting and Boating.

☞ *Many clubs have already joined in the movement looking to the establishment of a National Yachting Association, and others are yet to be heard from. All clubs which have the interests of the sport at heart should send in the names of their delegates, pursuant to the call issued, to the Secretary, Mr. John Frick, P. O. Box 2,070, New York. The first general meeting will be held towards the latter part of February.*

QUAKER CITY YACHT CLUB.—Officers elected for 1880: Commodore, A. F. Bancroft; Vice-Commodore, Charles B. Magee; Rear-Commodore, Robert Biddle, Jr.; President, Wm. Post; Treasurer, Robert Baird; Secretary, Charles S. Salin; Assistant Secretary, J. J. Baughman; Measurer, Capt. John C. Vanderslice; Regatta Committee, Robert P. Thompson, L. Coleman and John McCormick; Trustees, John C. Vanderslice, R. D. Rennick, B. F. Murphy and Paul Klotz; Membership Committee, John F. Loew, Robt. Baird and A. F. Bancroft.

YONKERS (N. Y.) YACHT CLUB.—Officers for the year: Commodore, A. J. Prime; Vice-Commodore, Charles Mercer; Secretary, James H. Couzens; Treasurer, A. Gould; Measurer, John Nesbitt; Steward, Peter Valentine; Trustees, J. Cokalete, A. Surrell and H. L. Garrison.

EAST BOSTON YACHT CLUB.—Officers for the year Commodore, Thomas H. Stone: Vice-Commodore, John P. Morrison; Flag Officer, F. T. Clayton; Recording Secretary, James L. Meagher; Financial Secretary, George B. Atwood; Treasurer, E. B. Currant; Steward, George B. Atwood; Trustees, E. B. Currant, Fred W. Kean; Directors, C. C. Cooper, John P. Morrison and F. T. Clayton.

HUDSON RIVER YACHT CLUB.—At the annual meeting of the club the following officers were elected for 1880:—Commodore, Richard V. Freeman; Vice-Commodore, George Wood; Treasurer, Joseph Stilger; Secretary, Edward R. Wilson; Measurer, Conrad Roth; Steward, John R. Clark; Board of Trustees, Samuel J. Henderson, T. Muller, Jr., John Kelly, Charles Swank, Henry Leute; Delegates to National Yachting Association, Commodore Freeman, Vice-Commodore Wood and John R. Clark.

MARYLAND YACHT CLUB.—Officers for the year:—President, Malcolm Chrichton; Vice-President, B. F. Ulman; Treasurer, Captain John Rogers; Secretaries, G. E. Webb, John Dobson.

SALISBURY POINT YACHT CLUB.—The Salisbury Point Yacht Club have elected the following officers for the ensuing year:—Commodore Stephen Lowell, Vice-Commodore, A. L. Fowler; Fleet Captain, J. F. Johnson; Secretary and Treasurer, A. C. Webster; Measurer, H. G. Leslie; Regatta Committee, Geo. H. Morrill, C. A. Boyd, G. L. Fernald; Finance Committee, Newell Boyd, O. S. Moore, R. S. Williams. The club has a large membership, and several new and large yachts are in process of construction, which will be added to the squadron.

NEW JERSEY YACHT CLUB.—The following are the delegates to the National Yachting Association:—Commodore T. H. Rogers, Vice-Commodore W. H. Dilworth and ex-Commodore Edward W. Ketcham.

SALEM YACHT CLUB.—This club is in a very prosperous condition and bids fair to become one of the most popular in Boston and vicinity. A plot of land has been bought and a fine club-house will be erected to cost about $1,500. A library and model room will be new features which will secure the support of yachtsmen for many miles around. The anchorage off the club-house pier is unsurpassed and a very desirable one for Boston yachtsmen who wish to do away with the tedious work of getting clear of the narrow waters of the harbor and the loss of time entailed in working out to sea. Many honorary members have joined at a nominal subscription in order to secure the benefits of the library which will be kept open winter and summer.

CLEVELAND YACHTING ASSOCIATION.—The fleet of this club is rapidly growing. Among them we enumerate as follows, giving their "gross measurement," which is their length on w. l. with beam and depth added:—Steam yacht *Rosaline*, flag-ship; schooners *Jane Anderson*, 62.3; *Camilla*, 44.10; *Stranger*, 29.8; *Harry Rettger*, 50.6; sloops *Harvey Burke*, 53.6; *Phantom*, 63.6; *Ida*, 38.5; *Unique*, 28.2; *Silver Spray*, 36.10; *Belle*, 36.5; *Gipsy*, 28.11; *Vixen*, 33.9; *Lady Ida*, 26.6; *Master Harry*, 23.8; *Kittie Walsh*, 32.7; *Nettie*, 24.8. The following do not belong to the association:—*Dolphin, Humming Bird, Nadine, White Cloud, Topsy, Sea Gull, Pinafore, Nomad, Meta, Unknown, Brooklyn.* This is certainly a very creditable showing and indicates the rapid strides the sport is making on the Lakes.

SAN FRANCISCO YACHT CLUB.—The new Governor of California is a member of the S. F. Y. C., and an ardent yachtsmen. Ex-Com. Ogden, lately in New York, returned to San Francisco, and we regret to announce the death of his brother recently. The schooner *J. C. Cousins* is reported sold to Con O'Conner. There is some talk about new yachts to be built, of which something may come before long. An "outside," or ocean cruise is contemplated by the club next summer, and Dr. Merritt will go to the Sandwich and South Sea Islands in his schooner *Casco*.

We hope to see the San Francisco Yacht Club inaugurate a series of nautical lectures shortly, those given last year having been well attended and appreciated.—[*S. F. Olympian.*

SEA-GOING STEAM YACHTS.—We are glad to refer to the card of Messrs. Ward, Stanton & Co. in our advertising columns, and can indorse their work from our own experience as of the highest class. It has been our good fortune to have had charge of a couple of their engines, and for simplicity in design, arrangement of material and smoothness in running it would be difficult to surpass them. Messrs. Ward, Stanton & Co. have added to their building facilities and plant and have a large amount of yacht work in hand. They have been so long and favorably known as the leading builders in America of large steam yachts, that their reputation has spread near and far.

YACHTS' PHOTOS.—Black & Co., 333 Washington street, Boston, have continued in their good work, and have added largely to their assortment of photos of American yachts. Their work is of the highest order, and a void has been filled through their enterprise.

FAST STEAM YACHTS.—Mr. Samuel Holmes, of 122 Front street, New York, makes a specialty of designing and contracting for high speed launches and yachts, after the Thorneycroft style. His success in *Continental, Miranda, Mineola*, etc., have established his reputation. Among owners of country residences along the Sound, Staten Island and Hudson River these fast launches promise to become popular.

LIST OF RACES.—In the Boston Y. C. races, June 21st, *Breeze* did not win nor was she entered as printed. The prize went to *Adrienne*, Mr. G. Pfaff.

LIST OF WINNERS.—*Regina*, Mr. W. A. W. Stewart, is a sloop, not cat as the list has it.

COST OF ENGLISH YACHTS.—Building prices vary, for while a few will contract to construct a vessel of such a size at about $150 per ton, or perhaps even less, others will require as much as $190 or $200 per ton, both prices being estimated for iron ballast. Thus, in one case, an 80-ton yawl would cost $12,000, and in the other, $16,000, the average being $14,000, or at the rate of $175 per ton. At this price builders would undertake to provide the ordinary cruising outfit, comprising cruising sails, gear, boats, chains, anchors, etc., but no extras or luxuries, and, above all, no lead. At the present moment pig lead is worth $90 per ton, and to mold it will cost more by $5 per ton, but taking it at the market price it is at least $70 a ton more costly than iron. Now, a yawl of eighty tons for cruising purposes would require over forty tons of lead for ballast, so that if this precious metal were preferred to iron, it would increase the expenditure by about $2,750. It is true that lead does not lose in weight, and is dependent on the market only for variations in value, so that buying it is not necessarily entailing a loss, as is the case with iron; and for this reason it is perhaps the most economical metal to use as ballast. The advantages of lead are, besides, many; it is more cleanly than iron, affords greater facilities for obtaining head room, and, ton for ton, gives the vessel greater stability, thus allowing a lesser weight to be shipped, and enabling the yacht to float lighter. For a fairly good yacht of say from two to about five or six years old, which has been well taken care of, about $130 to $140 per ton would be considered a very moderate price—this, of course, with iron ballast only.—*Land and Water.*

DRIFT.

YACHT building is having a boom....Dr. J. H. Vondy, J. C. Y. C., has not purchased his former schooner *Cornelia*, as reported, but has had a fine model made by Phil. Elsworth and may build soon....Beverly Y. C. proposes changing the date of their annual meeting from fourth Wednesday in January to the commencement of the yachting season....*Idler*, Mr. A. J. Fisher, Chicago, is on the berth for a voyage to Europe this spring. Mr. Fisher proposes to do some racing over there, and as *Idler* is a deep craft of moderate beam, she will stand some chance alongside of English clippers and not become an object of commiseration abroad, as *Viking, Faustine*, and *Ermengarde*, of the light draft persuasion....Decker, Twenty-second street and Second avenue, Brooklyn, is building a 70-ft. schooner....Election of officers N. Y. Y. C. Feb. 5th, at club-rooms; also, question of cruising steamer for summer's cruise....Mr. Alex. Taylor has purchased s. s. *Skylark*, and Mr. E. S. Jaffray, her former owner, is to have an iron steam-yacht of about 170 tons built by Cramp & Sons, Philadelphia....Next meeting of A. Y. C. March 8th....John Mumm, foot of Court street, South Brooklyn, has about finished a 48-ft. sloop....Schooner *Estelle*, Mr. J. D. Smith, is to have a new bow to do away with her present excessive flare.... Mr. Chas. A. Stevenson has bought the schooner *Osprey*, a fine cruiser....Laid up in Gowanus Basin: schooners *Dauntless, Intrepid, Comet, Triton, Rambler, Vision, Agnes, Peerless, Wanderer, Palmer*, and sloops *Mermaid, Fanny, Gracie, Winsome, Active, Christine, Imperia, Dudley*; sloops *Jizzie L., Wave, Schemer, Estella, Flying Cloud* and *Orion* are hauled out foot of Court street, South Brooklyn; sloop *America* is at Lennox's Yard, foot of Thirty-fourth street, South Brooklyn....Lawley, Boston, Mass., is to build a 50-ft. schooner something like the keel-cutter *Enterprise*....Rumor has it that Gen. Butler may soon leave for Cuba in the "Old America" and cruise in West India waters....The *Magic*, of Boston, is bound for the Chesapeake early in spring....Commodore Wm. Peet is having his tidy little *Sunshine* thoroughly overhauled by Lennox; new hardwood fittings throughout; Mr. Norman Torrence will act as skipper, and some extensive cruising will be undertaken....Mr. Henry Say offers the s. s. *Henriette* for sale at Baltimore, and is building a large iron screw yacht of seagoing dimensions at the yard of Malster & Reany, Baltimore. She is to be 250ft. long, 32ft. beam, and 20ft. deep. Compound engines, cylinders 46 and 30 inches ....John Roach & Son, Chester, Pa., have also contracted for a large iron screw yacht for Mr. Wm. Belden of nearly 700 tons. We are glad to see that at last the sailing model is being discarded in our steam yachts, and that we are to have fine, long, easy-sided and deep-draft steamers in place of the pot-bellied imitations of the sloop. Ward, Stanton & Co., of Newburgh, are likewise building a fine iron screw yacht for Mr. James Gordon Bennett; the dimensions published concerning her were altogether wrong; full particulars will appear in this journal. The new 80ft. schooner *Republic*, building at Nyack for Mr. H. J. Steer of Providence, is all in frame. His former monster sloop *Alice* is still for sale. Mr. Anson P. Stokes will probably build a larger double-hulled schooner to carry out experiments begun with *Nereid*. Mr. Stokes has the best wishes of the yachting public for his persistent and practical enterprise.... Schooner *Edith* has been sold out of the N. Y. Y. C. ....Schooner *Nettie*, Mr. F. P. Osborn, is laid up at Bath, Me., and will probably be extensively altered....*Restless*, flagship of the N. Y. Y. C., is laid up at Winthrop's Cove, Conn.....Sloop *America*, Mr. E. Yard, Jr., is to be lengthened aft; we hear of plenty of lengthening going on, but no one any longer talks of "hipping."....Sloop *Psyche*, N. Y. Y. C., Mr. E. M. Brown, now at New London, is also to be spun out aft....Iron cutter *Vindex*, formerly owned by Mr. Robt. Center, has been sold to Mr. E. D. Morgan, Jr., and will fly Sewanhaka colors....Mr. G. G. Haven, N. Y. Y. C., has bought the s. s. *Rival*....Alonzo E. Smith is building a fine sloop for Philadelphia parties, 41ft. long, also a working boat....Kirby, of Rye, has a lot of work promised. He is now building two small boats, and expects to lay the keels of two schooners; one for Chicago parties, and a third one for a Rye gentleman. He has also sent a model to Michigan for a schooner about 55ft. long and only 2ft. 6in. in draft for work in shoal water.... Schooner *Peerless* will remain in the A. Y. C. under her new owner, Mr. Hathaway of New Bedford....*Enigma*, of Boston, will have a new round stern; *Leslie* a new bow, and *Tempest* a new keel with iron ballast, as well as a general overhauling....*Dolphin*, of Boston, has been altered from centre-board to keel; the cat, *Herald*, has had her steel centre-board shifted for a wooden one—the steel sprung too much....Lawley & Sons have had to increase their capacity by leasing land from the Boston Iron Co.; *Adrienne* is being spun out by the stern; they have also completed a new cat for Dorchester parties. The famous *Undine*, sunk by a collision last summer, is hauled out at Lawley's, but nothing will be done to her till the courts decide the resposibility for the collision....The yacht clubs of France are giving lectures on yachting, following the excellent example set by the S. Y. C. and S. F. Y. C. Steam-yachts from 500 to 700 tons are becoming the rage in England; many new ones of this size are underway in the shipyards, some being of steel....Our little contemporaries froth at the mouth because we ousted a swindler, one of their bosom friends, from the N. Y. A.... Length measurement is unfortunately being agitated again in England; our cousins had better beware or they will fall into our evil ways and build washtubs instead of yachts, as such a rule is sure to produce stumpy, beamy, oversparred machines....France has been building a 65 foot centre-board sloop for the Nice races....Neafie & Levy, Philadelphia, are lengthening the steamship *Isabel*.... Columbia Y. C. proposes squadron cruises twice a month during the coming season.....The *Unique*, Captain Foster, of Gloucester, fully described in this journal, has made a voyage to Florida and has proven herself a grand sea boat and fast sailer, weathering several gales on the passage....Our friend the *Bycycling World* brought up all standing recently on the speed of ice yachts. They do sail faster than the wind, except when the wind is aft—see our back files....Mr. Thos. Lord, late of the *Osprey*, has presented to the New Bedford Y. C. the model of a Japanese junk, recently on exhibition at the fair of the 7th Regiment....Mr. Ashbury has taken to the yawl and is cruising in the *Iberia*, 80 tons, on the South American coast....The Y. R. A. of England has decided not to interfere in the matter of wages and racing in the dory fo... crews....The *Nautical Magazine* comments favorably upon the excellent paper on Lloyd's Yacht ... read by Mr. Dixon Kemp before the I. N. A. It has been printed in pamphlet form,

YACHT BUILDING IN BOSTON.

Editor Forest and Stream:—

Messrs. Hutchings & Pryor are building a deep keel boat about 29ft. on deck, 9ft. beam, 25ft. on line, with 5ft. draft, to order. They are very well along on their alterations of *Lillie* from centre-board to keel, which improves her looks and staunchness wonderfully. Messrs. H. & P. have also started on a cat-boat, to replace *Wave Crest*, sold last fall. The new boat will be inferior to none and superior to most when in the hands of her skipper, Mr. Hutchings.

Messrs. Lawley & Sons have kept very busy all their workmen in alterations and repairing. Mr. Pfaff's schooner *Adrienne* is improved very much in looks by the addition of 2½ft. overhang aft. Perhaps it might be wise to increase her speed by carrying aft her stern-post, giving her greater hold on the water. Messrs. Lawley have also a large 40-foot sloop to build, and they will put all their practical experience in play to produce the best construction and shape. This firm are undoubtedly the heaviest builders in Boston, and turn out nothing but first-class work. The new vessel will be a reality of strength and beauty—a deep keel boat for comfort and sea-going qualities.

Mr. Smith is building some fine tenders, and has quite a lot of alterations and repairing jobs on hand; and Messrs. Pierce Bros. are working away on their boat for the Mediterranean—a cat-boat, 26ft. long, very shoal and wide.

Mr. Robert Bibber is putting a cabin into a large cat-rig, which will make her very comfortable below decks. This boat was built and used back of the Cape. Her mate is kept in Fall River, and is considered a fast, able boat. The present owner of the *Gussie* will not race her, but use her for pastime only.

Mr. Anderson is putting a keel into the schooner *Mist*, and by report is building a cat-rig to beat Smith's *Herald*.

Mr. Webber is lengthening *Enigma* aft, which adds very much to her appearance, and as she is a very good sea boat, ought to add to her speed.

Mr. Tyler is having a 50-foot schooner built, under Mr. Dolben's superintendence, off of D. J. Lawlor's model. As she is not very far advanced not much can be said of her yet.

Mr. D. J. Lawlor is to build an English yawl on scientific principles, and she will probably be as much a wonder here as the catamarans. She will be the first yawl of English design in America. She is 40ft. w. l., 10ft. beam, and 7ft. hold; flushdeck, lead on the keel, and exceedingly roomy both below and on deck. Of course Lawlor will "lay himself out" in her construction, as his incomparable work is recognized all over the country. Possibly this yawl will be the forerunner of many others of her kind.

A new "cutter," 25ft. w. l., is also to be built for Boston parties, with 1,000 lbs. iron on the keel. Centre-boards have gone out of fashion, and keels, with low ballast, are fast displacing all others. They prove to be the best sea-boats, and *Viking* last season showed them to be fast as well. KEDGE.

THE DREADNAUGHT SCHOONER.—This fine schooner has been sold to Chicago. She was unquestionably, next to *Intrepid*, the finest keel schooner in American waters, as well as the handsomest, since *Sappho* hoisted green-white-and-red. This is what the *World* has to say about her:—

"The schooner yacht *Dreadnaught*, which has just been sold by Mr. Charles J. Osborn to a Chicago gentleman, is well known here and has figured prominently in yachting contests ever since she was built. Shortly after the *Cambria-Dauntless* race across the ocean Captain Samuel Samuels, who had commanded the *Dauntless* in that race, being in the office of a well-known Erie lawyer, said to him, the conversation having turned upon yachts and yachting, "Mr. Blank, why don't you let me build you a yacht that shall beat anything afloat?"

"Go see what it can be done for," was the prompt reply; "a yacht every way first class, in which I can take my family to Europe."

The proposal was accepted by Poillon, of Brooklyn, the model was made, and finally approved by Captain Samuels, and the contract was signed by the lawyer, the price agreed upon having been $35,000 in seven monthly payments of $5,000 each. The keel was laid on the 15th of September 1870, and the yacht was to be completed on the 15th of April 1871. It is not too much to say that she was the strongest yacht ever built in this city, her timbers being of extra size, the floor timbers of oak, nine inches by seven, formed of natural knees and bolted down through the keel by seven-eighth inch bolts through each floor. When some years later she was lengthened, Mr. Steers, who did the work, said that there was twice as much timber in her as was necessary. Her owner altered his mind, and concluded that he didn't want a yacht, and told Samuels to sell her. To sell a new and untried yacht for anything like her cost was impossible. That cost, by the way, had been augmented about $8,000 by cabin embellishments. The lawyer refused to advance any more money, and so the expense of running the yacht during the first season was borne by Mr. Poillon, the builder, who took lien upon the vessel.

No man ever worked harder, however, than Captain Samuels did during that season to prove that the *Dreadnaught* was the fastest yacht afloat. In this he failed. She was simply a first-class yacht, but inferior in speed to several of the schooners of the New York Club. At that time she was 95 feet on the keel, 108 on water-line, 120 feet on deck, with 24 feet 6 inches breadth of beam and 8 feet 6 inches depth of hold. Her most famous performance was her race with the *Sappho*, twenty miles to windward from Sandy Hook lightship, which was finished in a hard gale of wind, both yachts being buried to the hatch combings and dragging their booms in the water, yet neither daring to stop to reef for fear of losing the race. The *Dreadnaught* was within four minutes of the *Sappho* in that race and nearer to that celebrated

than any other schooner ever got in a twenty mile race outside. Last season she was purchased by Mr. A. B. Stockwell (at that time Commodore and President of the Pacific Mail Steamship Company) for, it was stated at the time, $24,000, and under his ownership she took part in all the contests of 1873, including the celebrated Cape May contests for cups given by Mr. Bennett for yachts, pilot boats and working schooners. The *Enchantress* beat her, and then followed that somewhat acerb correspondence between Mr. Stockwell and Mr. J. W. Loubat, at the end of which the *Enchantress* took the Cape May Cup, which the *Dreadnaught* had previously won from the *Palmer*. During the season of 1874 the *Dreadnought* did little, her owner's business requiring his undivided attention. During the season of 1875 the yacht was laid up, but in the spring of 1876 she was purchased by Mr. Charles J. Osborn for, it is said, a tithe of what he has expended upon her since. She was at once put under Mr. Steer's charge and lengthened fifteen feet forward, the new bow improving her appearance wonderfully. The cabin was also completely remodelled and newly upholstered. In her new form the *Dreadnaught* is, in the opinion of many yachting experts, the fastest keel-schooner in this country. The price for which she has just been sold is reported at $15,000, and it is probably under rather than over that. The yacht was named in honor of Mr. David Ogden's famous clipper ship *Dreadnaught*. She has been commanded since she was launched by Captain J. E. Smith, who still retains his command and will go with her to the lakes.

BAY OF QUINTE YACHT CLUB.—*Editor Forest and Stream*:—Cuthbert has in hand at Trenton a big sloop, which is now well advanced towards completion, so far as her hull is concerned, being all caulked and completed, except the cabin, upon which the workmen are now busy. The dimensions of the vessel and spars are as follows: Hull—Length of keel 54 feet 6 inches; length over all 58 feet 6 inches; breadth of beam 16 feet 6 inches; length of centre-board 16 feet; draught of water aft 4 feet 6 inches; draught forward 2 feet. Tonnage measurement 55 tons. Spars—Bowsprit out-board 23 feet; mast 56 feet; topmast 27 feet; main boom 53 feet; gaff 34 feet. The frame is of oak, and rock elm and pine planking 2 inches thick; covering board, deck frames and mast partners, oak; deck plank, pine one and three quarter inch square, bent around in the shape of the yacht; fastenings all of galvanized iron. The cabin will be handsomely panelled with ash, walnut and grey elm, with gilt mouldings, and will have 6 feet head room. The starboard stateroom will be 12 feet long and fitted with two double berths, suitable for a family room, panelled and painted white. The port stateroom will be 7 feet long and similarly finished. There will be wash room and water closet on port side, a forecastle with two berths, lockers for provisions, ice locker for meats, lockers for dishes and cooking utensils, and the forcastle will be fitted in a pantry and kitchen. The yacht will thus be first class in every particular. She is one foot shorter and one foot less beam than the famous *Annie Cuthbert* (now the *Greyhound*, of Chicago), champion of the lakes, which was also built by Cuthbert; and being of superior model to that famous flyer, is tolerably certain to prove her superior in point of speed. This splendid yacht will fly the colors of the Bay of Quinte Yacht Club.

PORT TACK.

ACTIVITY AMONG CANOEISTS.—It is proposed to have all the canoe clubs in New York and vicinity join hands in establishing a regular series of races every fortnight during summer, entries to be open to the clubs joining. A champion pennant will be offered, to be transferred from winner to winner; a permanent prize to be given to any one winning the pennant a certain number of times. Two entries to constitute a race, and liberty to a single entry to make a walk-over. These semi-monthly meets will bring canoeists together, and the informal racing will be the means of promoting the welfare of the sport. The following are among the signatures obtained to the "call" for a Canoe Congress, printed in our issue of Jan. 1st: Col. C. L. Norton, 849 Broadway, Commodore N.Y. C.C.; C. E. Chase, 287 Broadway, Commodore J. C. C. C.; J. F. West, 144 Duane street, N. Y.; W. P. Stevens, Rahway, N. J.; W. L. Ogden, N. Y.; William Whitlock, N. Y.; G. Livingston Morse, N. Y.; John Habberton, N. Y.; R. L. Neville, N. Y.; R. J. Wilkins, N. Y.; N. H. Bishop, Lake George, N.Y.; K. N. Putnam, 54 Wall street, N. Y.; A. H. Siegfried, St. Paul; J. M. Barnes, Louisville, Ky.; Judge Nicholas Longworth, Cincinnati C.C.; Lucien Wulsin, C. C. C.; W. M. Greenwood, Commodore C. C. C.; R. D. Wynkoop, Jersey City; E. A. Ransom, Jersey City; Marcus Higginbotham, Jersey City; Karl F. Bergman, Jersey City; William J. Gardner, Newark; W. H. Potts, Trenton. N. J.; Rev. C. A. Cressy, Landaff, N. H., as well as many others.

THE QUESTION OF TYPE.

Editor Forest and Stream:—

Having been much interested in the discussion in your paper for some time past, in reference to different types of yachts, I hope that, although you may consider it advisable to refrain from editorial comments, you will encourage communications upon the subject from your readers, especially from yacht designers and builders of experience. Mr. Kirby's letter is brimful of information, and has sound, sensible explanations of the whole question as he understands it. And who shall say that he is wrong on those points upon which authorities agree to disagree, and leave their deductions upon such crude foundations that students cannot unravel them?

Mr. Scott Russell's theory of wave-lines was a failure in his own hands. Rankine's stream-line theory furnishes no data. Froude's elaborate experiments and calculations are, by his own confession, not even theoretically satisfactory.

Mr. Kemp generalizes from known vessels, taking *Sappho* as a standard of perfection in speed; Marett the same, taking *America* as a standard for comparison—both English authors, but each selects American yachts. Mr. A. Carey Smith in his lectures takes *Comet* as his standard.

Let us see who designed these yachts. The *Sappho* was a failure until hipped by R. Fish; so to him belongs the honor of her success afterwards. The *America* was designed by Steers, a practical man; the *Comet* by Elsworth; the *Arrow* by Kirby. Now is it not singular that these very men work without any profound theoretical knowledge, and some of them without any theory at all? Everybody knows that Steer's boats were a little faster; all of Fish's boats go; all of "Kirby's boats go; Smith's go.

In answer to your correspondent, "Martin Gale," I will say, that the fact that Kirby did "carve" the *Arrow*, is a practical and thorough demonstration that he can "carve" another as good.

If my memory serves me, Mr. R. Center in due form issued a challenge in this paper in behalf of the cutter *Volante*, which was accepted in similar public manner by Mr. Clapham in behalf of his forty-feet sharpie, but the cutter has not come to time. Perhaps she is not up to her usual performances latterly.

New York, Jan. 12th. CORINTHIAN.

THE CANOE CONGRESS.

The following letter has been addressed to foreign canoe clubs:—

To the Officers and Members of the Royal Canoe Club and its branches:—

GENTLEMEN:—The organized canoe clubs of the United States have united in calling a Canoe Congress for the purpose of forming a National Canoe Club. All canoeists in the United States and Canada, whether belonging to clubs or not, are invited to attend.

The congress will meet on the third day of August, 1880, at Caldwell, New York State, at the head of Lake George. Sailing and paddling races will be held on 3d, 4th, 5th and 6th days of August, and the Committee of Arrangements hope that fully one hundred canoeists will be present with their canoes. There are excellent hotels at Caldwell, but it is anticipated that most of the canoeists will camp together on the shore of the lake.

Members of the Royal Canoe Club and its branches are warmly invited to bring their canoes and take part in the races. Caldwell is situated not far from Albany, New York State, and can be reached from New York, Boston, or Montreal in a few hours. Lake George is generally regarded as the most picturesque lake in the Eastern States, and abounds in fish. It is an excellent starting point for a canoe cruise by way of Lake Champlain and the Sorel River, to the River St. Lawrence and its Canadian tributaries; or by way of Lake Champlain, the Champlain Canal and Hudson River to New York City. Come over and race, camp, and cruise with us. A fraternal welcome awaits any member of the Royal Mother Canoe Club. Very truly yours,

W. L. ALDEN, Com. New York Canoe Club,
CHAS. E. CHASE, Com. Jersey City Canoe Club,
Hon. NICHOLAS LONGWORTH,
Com. Cincinnati Canoe Club.

Answers to Correspondents.

☞ *Correspondents who may send us their proper name and address will always receive prompt attention in these columns. We require a man's name for two reasons: (1) sometimes as a guarantee of good faith, and (2) always as a matter of common courtesy. As a rule we do not reply to inquiries by mail, except in cases demanding immediate advice.*

W. G. W., Memphis, Tenn.—See answer to X. Y. Z. in this column.

G. H. D., Jr., Carson, Nev.—Address George W. Pownal, Christiana, Pa.

CROSS, Hagerstown, Ind.—The offsprings of a bull terrier bitch by a pointer dog are worthless.

A. F. de N., New York.—For live quail address Mr. Malley, Hight Point, N. C. See note from him in another column.

H. B., Brooklyn.—State by which route you propose going to San Francisco, and we will send you the desired information.

W. B. F., St. Catherines, Ontario.—You may send your fish for sale on commission to Eugene G. Blackford, Fulton Market, New York.

J. A. C., Knox County, O.—Address L. M. Wooden, Rochester, N. Y. Cannot give you information concerning party of whom you write.

SUBSCRIBER.—"Canoe Cruise in the Baltic," by Baden Powell; "Canoeing in Kanuckia," "Canoe and Flying Proa;" Orange Judd Company, 245 Broadway, N. Y.

T. A. A., Chelsea, Mass.—We make no charge for recording kennel notices in our paper, but take pleasure in giving all the information we can to our subscribers.

W. W. K.—See our advertisers for hunters' boat, price $25 to $45. English book on boat-building costs $1.25. Can obtain it for you. Nothing like your own experience, though.

C. H. R., Philadelphia.—Mr. Thos. Clapham is the only party we know of who makes a specialty of steam sharpies. They are cheap, strong, light draft, and adapted for river and bay work.

NOVICE.—If "Novice" will call on Mr. Thos. Miller, 340 Wyckoff street, Brooklyn, he will receive full instructions as to best cruising grounds in these waters. Drop Mr. Miller a line when you intend to call.

T. D., Secretary.—If yacht clubs would take the pains to see that local papers publish correct accounts of their racing they would save themselves the trouble of sending in corrections at the end of the year.

PIKE, Goshen, N. Y.—If ten men agree to play two games of chess with each man how many games do they play? A says ninety; B says 180. Ans. The schoolmaster must be abroad in Goshen. If you count them up on your fingers, you will find that 180 is the correct result.

N. S., New York.—Address of Brooklyn Y. C, is Halsey Building, 371 Fulton street, Brooklyn. We know nothing of its financial affairs, nor are they any concern of ours. Apply yourself. If they owe you, the club will unquestionably liquidate its debts. Wether the club is to be resuscitated or not depends only upon its members.

C. S. G., Amesbury, Mass.—Please inform me if the Phœnix rifle model 1873, made by the Whitney Arms Company, are good rifles and accurate shooters, and if they are all they are said to be by the company? Please inform me if C. L. Ritzmann, of 940 Broadway, New York, is a reliable dealer and if I shall be squarely used if I trade with him? Ans. 1. Yes. 2. Yes.

DAKOTA, Yankton.—Please inform me at what time I should cut the tails of my setter puppies, now six months old, and how many joints should be taken off? Ans. Tailing should always be performed, when intended, a few days after birth, while the parts are tender, easily and instantaneously removed. We do not believe in the operation, and your puppies are now too old.

X. Y. Z., Michigan.—I have a pointer bitch three years old, has been bred two or three times to No. 1 pointer dog; is now in whelp to an English setter; will this cross affect her future progeny, and in what way? Ans. Not necessarily so; but it is not positive that it will not affect her future progeny. Should the bitch have been bred in the first instance to a setter, there would have been indications of the cross ever afterward.

N. D., Providence, R. I.—We cannot find the author of the lines—

"I'll tell you the story, but pass the 'Jack'
And let me make merry to night my men.
Ay! those were the days when my beard was black;
I like to remember them now and then."

Perhaps some of our readers can enlighten us.

B. H. P., Vicksburg, Miss.—About a year ago you published an interesting letter from some Sour Springs, or Lake, in Texas. Please give me the name of the post-office there. I am affected with rheumatism, and am thinking of going there. Your prompt attention to this will very greatly oblige your friend and correspondent. Ans. The post-office is Sour Lake, Jefferson County, Tex. Address the proprietor of the hotel, whose name was not given in article referred to.

H. P., Rochester.—Almost impossible to remove mildew. Scrub with soap and water, rinse, sprinkle with dilute solution of lime, and bleach in sun. To prevent mildew, Mr. John Boyle, tents, 203 Fulton street, uses the following: Dissolve in fourteen gallons of water one pound finely powdered alum and two ounces finely powdered sugar of lead. When thoroughly dissolved, steep the canvas so that the solution will permeate every part of the same for ten hours. Then dry in the open air. The proportion of alum and sugar of lead should be increased for duck or canvas heavier than ten-ounce ravens or army duck.

SPORT, New York.—My cocker spaniel has some disease of his hind legs. When sitting he rests on his hips, and is not able to use his hind legs. When he is lying down his legs tremble. He at times has the hiccough badly. I keep him in a warm room at night, and in the day time he is allowed to run about. His hind quarters do not grow in comparison with the rest of his body. Will the mange affect his legs? He spends most of his time in sleeping, and has lost his playfulness, and appetite is poor. Does it injure a young dog to give him a little cooked meat? Ans. The dog would seem to have partial paralysis of his hind quarters; the cause not hinted at; the exact age of the dog should be given. Send us full particulars, and we will reply at once.

J. T. P., Va.—1. A friend writes from Tennessee, stating that they have there what are called "double-nosed dogs," that is, they have three nostrils. What kind of dogs are they, and can they scent better than other dogs? 2. My hound pup's eyes are filled with matter every morning—what is the cause? 3. What are the symptoms of distemper in its first stage? 4. How does sub-sulphur differ from ordinary sulphur? 5. What is meant by in the stud? 6. Should fox-hound puppies be first trained on rabbits, or will hunting rabbits injure them for foxes? 7. My puppies, one year old, seem to be afraid to leave me, and don't hunt off far enough—how shall I remedy this? Ans. 1. We are very much interested at hearing of your friend's dog with three nostrils, and will be pleased to learn from Tennessee about him. A dog of this kind we have never seen. We remember, however, of once hearing of a Newfoundland dog in Indiana with four nostrils, but then the animal was favored with two heads; the remainder of the dogs which have come to our notice, have been limited to only two channels through which to "snuff." There is no doubt, however, that if a dog can scent with two nostrils, he should be able to scent half as well again with three, that is, provided the three nostrils were confined to one nose. There is no distinct breed of "double-nosed dogs," though they can be bred to. The double nose is a malformation, and, at the present day, is considered a deformity. There is no reason why a "double-nosed dog" should scent better than a dog without one, any more than a man with a hair-lip should be able to extract more perfume from a rose than any other human being. 2. The running from the dog's eyes may be caused from a cold; you do not describe sufficiently 3. The usual symptoms of this malady in young dogs are: sudden loss of spirit, of activity, and appetite; drowsiness, dullness of the eyes, and lying at length with the nose to the ground; coldness in the extremities of the ears and legs; with heat of the head and body, sometimes nearly scorching; sudden emaciation and excessive weakness, particularly in the hind-quarters, which begin to sink and drag after the animal; the flanks pinched in; an apparent tendency to evacuate from the bowels a little at a time; sometimes vomiting; the eyes and nose are often, but not always, affected with a discharge. 4. Sub-sulphur, or sublime sulphur, is powdered; sulphur, or brimstone, is in sticks or rolls. 5. When a dog is said to be in the stud, it is meant to imply that he is held for breeding purposes. 6-7. By many it is supposed that the animal we call the fox-hound, is designed by nature to hunt foxes exclusively; but this is a popular error. The hound, from his own natural instinct will run anything with *scent* that will flee before him. It is from tuition alone—by being entered at and worked to a particular description of game, cheered to pursue it, rated and flogged when he hunts any other, that the hound acquires the qualities which belong to the class for which he is designed. No one yet saw a puppy in his first rudiments of education but what would hunt rabbits, foxes, or anything that he might chance to find; or, the sooner that he is strung up on the first convenient branch, the better; for it is easy to stop him when in error, but it is quite impossible to instil the dash and spirit of hunting into him by any artificial means. We like to see a wild puppy, ready to tear through any brier patch at the first sight or scent of game. We then know he has the right stuff in him; and if he wants the wire-edge taken off, time, patience, and perseverance will effect the desired object. But, if we see a tame-looking, timid wretch, slinking about and taking no notice whatever of the rabbits and foxes that may bolt under his nose, we read to him his obituary notice and deliver him unto Jack Ketch. We would advise you to look up some old hunter of your vicinity, and ingratiate yourself in his good graces; if he be of the right sort, he will teach you more in one day's hunting than you will ever pick up in any other way. Old hounds will leave a rabbit-track and follow the crossing track of the fox, the scent of which is much stronger. Take your puppies out singly with some old sure-and-slow running hound, and if they are proper dogs they will soon take to their work.

☞ CHARLES HALLOCK, having closed his connection with the Forest and Stream Publishing Company, may now be found at his office at 61 Broadway, room 23, where all personal letters and communications should be addressed.

BUY NONE BUT THE BEST.—The "Red Rubber Recoil Pad" sent, postpaid, on receipt of $2. Recommended by the FOREST AND STREAM. Charles L. Ritzmann, importer of fine guns, 943 Broadway, New York City. Send stamp for list of second-hand guns and rifles.—*Adv.*

☞ *Correspondents will please address all letters to the Forest and Stream Publishing Company.*

FOREST AND STREAM
ROD AND GUN

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INCULCATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY:

PUBLISHED BY

FOREST AND STREAM PUBLISHING COMPANY.

—AT—

No. 111 FULTON STREET, NEW YORK.

[POST OFFICE BOX 2832.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Advertising Rates.

Inside pages, nonpariel type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial column, 60 cents per line—eight words to the line, and twelve lines to one inch.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

***Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, JANUARY 29, 1880.

To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith and be addressed to FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. Anonymous communications will not be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of mail service if money remited to us is lost.

☞ Trade supplied by American News Company.

OUR PRIZE LIST.—The responses to our offer of premiums and prizes has been eminently satisfactory. We again invite attention to the schedule as published elsewhere, and admonish our friends that the man who bags the first prize must be afield before the dawn and return late at night.

A BOOK ON THE BLACK BASS.—Our valued correspondent, Dr. J. A. Henshall, of Cynthiana, Ky., is devoting his spare moments to writing a book on the "Black Bass," including the technology, history, habits, angling, etc. The entertaining and instructive papers on black bass fishing contributed to our columns by Dr. Henshall contain sufficient assurance of the merit of the book. We shall welcome it as a desirable addition to our angling literature.

OBITUARY.—We regret to announce the death of Commodore Homer C. Blake, at his home, 10 East Thirty-third street, Jan. 21st, after an illness of about six weeks. He leaves a wife and a daughter to mourn his loss. Commodore Blake was a native of Stanford, New York, and entered the service in 1840. He commanded the frigate *Sabine* in 1861 and was commissioned as Lieut.-Commander in 1862, taking command of the steamer *Hatteras* of the Gulf blockading squadron. In 1863 he had charge of the *Utah*, and in the next year was present at the battle of Malvern Hill. He was promoted to commander in 1866, and was subsequently stationed for three years in New York, and since 1875 has been waiting orders. In October last he was appointed a Commodore, and was confirmed as such by the Senate a week before his death. While Captain of the *Hatteras* he fought the famous engagement with the Confederate steamer *Alabama*, resulting in the loss of his vessel, the explosion of a shell which pierced the cylinder rendering the pumps useless, the *Hatteras* sinking a few minutes after her officers and crew had been taken off by the *Alabama*. They were carried to Port Royal and paroled.

—Our issue of Jan. 15th, despite what we supposed was a full provision for any emergency, met with such an unlooked for and extraordinary demand that the entire edition was exhausted before noon of publication day. We trust that contributors who did not receive their full quotas, and others who have ordered copies of that date, will possess their souls in patience until we can secure returns for their supply. To run out of an edition in this way causes much annoyance, but for ourselves it is, after all, a pleasant unpleasantness.

SPORTSMEN'S EXCURSION CARS.

THE strength of an opinion or of a taste is determined by the amount of capital invested to maintain or to indulge it. If we would estimate the standing of American field sports to-day we must consider the pecuniary and mercantile side of the question. Measured by this standard the fraternity of sportsmen is important and powerful. Millions of dollars are invested in supplying its demands. Scores of firms are engaged in the manufacture of rifles, shot guns, fishing tackle, archery, and cricket goods and other paraphernalia of the craft, and in the construction of yachts and pleasure boats. These industries demand costly and elaborate machinery and skilled workmen. The supply must be of the best grade of material and workmanship, for the purchaser is exacting and competition pressing. The rules which insure success in other branches of business have full weight here. The manufacturer of a fine arm knows that one gun sold means two more ordered. The fishing rod goes forth from the shop as dry as Aaron's wand, but the expert who has made it knows that in due time it will bud and blossom into orders for others. The demand for first-class sporting outfits is vastly greater in 1880 than it was in 1870. The ledgers of our advertisers tell this. The displays in their show windows have very much the effect upon passers-by of the Mountain of Gold upon Sinbad the Sailor in the Arabian Nights.

These industries minister to man's enjoyment. They supplement the provision of food, shelter and clothing. Their tendency is towards luxury. One end of the scale is filled by the flint lock handed down, like the veterans of Bunker Hill, "from a former generation;" originally fashioned for the slaughter of man, now relegated to the conquest of the irascible though harmless wild turkey. The other extreme presents the $500 beauty made to order and finished with the exquisite workmanship of an artist.

One of the most noticeable advances in providing for the sportsman's comfort is the construction of excursion cars fitted up with special reference to shooting expeditions. Some months ago we described the two cars built by the Pullman Palace Car Co., and our readers have long been familiar with the pioneer car of this character, "The City of Worcester." At an annual meeting of the Worcester (Mass.) Excursion Car Company, Mr. Jerome Marble, the President, gave a detailed statement of the history of the enterprise. Originally purchased at a cost of $6,840, further expenses have been incurred in adding new furniture, piano, folding chairs, etc. The car has earned since September 3d, 1878, the sum of $3,516.46, leaving over $1,100 after paying all expenses. After paying the recently declared dividend of 10 per cent. there is a surplus of about $415, which is considered a creditable fifteen months' business, and the company are so well pleased and so sanguine of the future that they are considering the construction of another car of like character.

The car has four sections and berths of the same width as in other sleeping cars, and two berths in the reading room, a sofa by day and a bed by night. There is a full supply of bedding for a party of fourteen, with kitchen and table furniture, refrigerators, ice locker, water tanks and all other equipments of the most elaborate cars of the day. With a cook and porter its terms are only $20 per day, with liberal discounts for long trips. That this is cheap travelling is shown by the record of the car, of which the first trip was to Montreal, Quebec and the White Mountains in July, 1878, by the stockholders and their ladies, twenty-two in all, and all were accommodated. It occupied five days. The first regular trip was with a shooting party to Minnesota and Dakota, of seventy-eight days, at an expense of $203.05 to each participant. The next trip of importance was with a party of fourteen to California, of seventy-five days, and costing about $700 per individual, and the last was a party of fourteen to Iowa and Nebraska, for shooting, at a cost of 209.78 per individual for a trip of sixty-nine days. The car has been run 18,000 miles. This experience proves that there is a saving of from 30 to 40 per cent. over any other method of journeying for similar purposes, and besides much pleasanter surroundings are secured. The car has been chartered for the month of February by a party of ladies and gentlemen of Worcester and Boston for a journey to Florida.

PROFESSOR JAMES W. MILNER.—It is with extreme regret that we chronicle the death at his home in Waukegan, Ill., on the 6th inst., of Professor James W. Milner. Professor Milner was one of the most earnest workers in the ranks of America's scientific corps. As a member of the United States Fish Commission he had accomplished most valuable work, and his future was full of promise. By his death the Fish Commission has sustained a loss not easily filled again. Born Jan. 11th, 1841, the subject of this notice early devoted himself to an earnest and arduous pursuit of scientific study; he graduated at the Northwestern University, and after serving with honor during the war, was soon selected by Professor Baird as one of his staff of assistants. In 1871, as Deputy United States Fish Commissioner, in charge of the Eastern Department, he thoroughly investigated the natural history of the whitefish, and his able essay upon the subject was published in the Report for 1872-3. For the past two years Professor Milner had vainly sought health in different climates, but at length gave up hope and returned to his childhood's home to await the end. We extend our most sincere sympathy to his associates and friends.

PRIZES FOR SEAMANSHIP.

NOT long ago we had occasion to call attention prominently to an innovation in the way of prizes introduced by the San Francisco Yacht Club, a venture which was much appreciated by its members. We allude to the presentation of rewards for "neatness" or perfection in the display of seamanship in and about a yacht. It may be remembered that the first prize of the kind was carried off by the indefatigable Secretary of the S. F. Y. C., Mr. C. G. Yale, in his smart and well-kept yawl *Enid*. A board of officers, composed of disinterested and competent men, selected from the mercantile and national navies, together with a representative of the yachting interests, was charged with making a minute examination of the club's fleet while assembled in squadron on one of their regular cruises, with especial reference to the thoroughness of outfit and the seamanship displayed in the keep of each owner's yacht. The wholesome rivalry engendered by a competition of this sort, in which every one is interested in preserving the highest state of efficiency, order and discipline, with an ample supply in what should constitute the boatswains' and navigators' departments, cannot fail to be of great benefit to the rapid development of both seamanship and the navigator's art as applied to practice, in addition to which the amateur skipper will acquire an outline at least of much that should be familiar to all who take kindly to the sea.

To the professional eye the shortcomings of the great majority of our yachts in all the care, finish, devices and implements with which the thoroughbred sailor arms himself for sudden and unforseen emergencies, and with which he surrounds himself as aids to picking his way in unknown harbors; by which he lays his course, knows where he is going to bring up, and is aware of what is to be expected before it looms up close aboard—to the professional eye the want and neglect in these respects is not calculated to impress any one favorably with the capacity, experience, or reliability of our amateur sailors. Since yachting has taken such universal hold upon our coast and lake population, and as craft are multiplying fast and cruising is being extended beyond the confines of river and sheltered bay, may it not be as well for clubs to encourage the healthy development of the arts we are lacking in by following the example set by the S. F. Y. C.

It is a common, and by no means agreeable sight, in stepping aboard our yachts, to note at once that the sailor is wanting; that the owner does not know or care enough to keep his craft and gear in ship-shape fashion, and that his hired crew, graduates of the fishing-smack fraternity, know or care still less. What with a total absence of precautions for heavy weather, no storm canvas of any sort, summer sails; ground tackle that would part, or come home in any sort of stress; kleets that pull out in a breeze; "spreaders" that double up upon the slightest provocation; topmasts carried aloft in a gale; bowsprit shrouds hanging in a bight, because the rigger fails to provide foot-ropes to lay out on; bobstays full of kinks, the result of fouling boats under the bow and butting against buoys and the like; sheer-poles on a cant, and deadeyes on a slue; rigging shabbily set up, with the tail ends of the lanyards flying to the breeze; no binnacle worth the name; side-lights an unseen myth, and the riding light a forlorn decrepit arrangement of tin; an opera-glass of low power too often doing the duty of a French binocular; charts and sailing directions conspicuous by their absence; even oil skins and pea-jackets things many yachtsmen have never even donned; stranded gear; no log; no lead; no palm or needle; no boat!

But it is unnecessary to carry this indictment any further; nor do we think the truth of the above will be disputed by any one who has had practical experience in sailing aboard all kinds of yachts of all tonnages and rigs. That we have some notable exceptions, a small minority of vessels owned and skippered by thorough sailors and kept in man-o'-war fashion, is true enough; but unfortunately they are too few to give color to the mass, and as a whole it cannot be disputed that our yachts and yachtsmen are lamentably deficient in the directions pointed out.

There is no particular object, no reason that they see, why any exertions should be made to improve any faster than by the dribbling process of gradual emancipation from the lubber into the sailor graduate, by methods such as experience in the end will force upon subjects too often unwilling and slow enough at first.

If yacht clubs, however, will learn a lesson from San Francisco, "Irish pennants" aloft, shabby rigging on deck and deficient outfit below, will all the sooner become chapters of the past when yachting and yachtsmen were only in their infancy.

CITY SPORTING DOGS.

STATISTICS show that there are upwards of 15,000 dogs housed within the limits of the city of New York—there may be many more, there certainly are no less. Of this number, it is fair to presume that very many are sporting dogs, that is, pointers, setters, spaniels and hounds. The first two named breeds, however, are greatly in predominance; but although these claim our special attention, our observations will apply to the whole class.

The owners of these dogs—the city sportsmen—either men of business, or men of leisure, are as a rule, both in theory and in practice, infinitely more exacting of their field companions than those who dwell on the wooded hill-side or prairie.

Fresh from off the chain, without any preparatory exercise comes Don, to stand the dust and joltings of many miles in a long railway journey, and expected at the end to last through his owner's fortnight holiday. His master, wearied with hard work, or exhausted with *ennui*, becomes a boy again, all eager for the sport, and Don must be ready for a start long before the sun is fairly up: and so it goes on day after day, early and late, wet or dry; for his master must make the most of his time. Thus oftentimes, Don has to take the field when, as far as finding birds is concerned, he might as well be in the Dogstar, or resting in that happy hunting ground which Byron mourns that all dogs are denied. But though fagged, foot-sore, jaded, he is ever patient and willing to work as long as he can crawl. Should the sportsman tire out there is no rest for Don, as it is often his fate to be loaned for the day while his master lies up for repairs. The vacation ended, the dog is brought back to some stable or basement where he seldom sees the sun or basks in comfort in its rays. Even the fresh air of Heaven is denied him; he scents only an atmosphere of smoke. Perhaps he is fortunate enough to be kennelled in some back-yard, say eighteen by twelve, damp from the everlasting shade of bricks and mortar; yet on the top of all this, we hear the owner wonder why the dog did not work better, show a finer nose, and why he tired out so soon.

At the end of a four-foot chain, and fed on that most unwholesome food, the leavings of a city-man's table, there Don stops until it is time for him to plunge into ice water "to look for snipe." Then if the dog takes cold and dies the owner ceases to give himself up to astonishment, but devotes his spare moments in reflections of a personal character on the breeder who sold him the dog.

This is no fancy sketch, but honest, downright truth. Should these words conjure up one doubt, go watch those who go "a-hunting." Select the eve of a public holiday or the day before the "law is up." Stand by the gate of one of our railroad ferries, and watch the files of "hunters" who pass in review. Tugging behind them, stiffened in every joint, come the strings of fattened Dons which are literally being led to the slaughter. Is it strange that oftentimes the sportsman's bag is empty?

Look at that mighty "hunter," moving sideways like a crab, being on one hand weighed down with shot and the taut chain by which he leads his dog. He has a "blue jees" feather in his hat, the trophy of his unwonted skill. His eyes are fixed, and like some ancient seer he already sees bright visions of the morrow's sport. While it is evident that it is his intention to visit New Jersey, the dog, a fine red setter, seems to prefer Long Island. Biped vs. Quadruped; a match, however, where the least number of legs proves the winner, and Jersey gains the day.

It is natural that the owners of good dogs should wish to have them under their own supervision. The fear that they may be ill treated, badly handled, or shot over, if they once get out of their sight, prevents many from wintering their dogs in the country. But we would remind these that there are a number of boarding kennels which are conducted by proprietors who are perfectly reliable, and of all seasons in the year the wirter is the time when dogs require most exercise. The slippery and filthy condition of city streets often precludes the owner from exercising his dogs, even if his business hours permit. It is, therefore, the object of every sportsman to see that his dogs are fed on wholesome food, prepared especially for them, kenneled in a cleanly place, and given regular exercise at stated times. Any city man who can afford to own a sporting dog and pay the tax is either able to spare the time to exercise the dog himself, or to employ some poor fellow to do it for him.

Unquestionably the expense of boarding a dog in the country is greater than the keep of a dog at home, even should he be properly fed and exercised as we recommend; but on the other hand, should the animal be taken sick, as he is almost sure to be, unless special attention is paid to him, the cost of his sickness will be very much heavier than if he was in the hands of an experienced and practical man whose business it is to care for dogs.

Let any one who doubts this try the feasibility of our plan, and we assure him that he will in many ways next season be more than rewarded for the expense and trouble.

DIRECTORY TO GAME AND FISH RESORTS.

OUR directory promises to be as valuable to the American sportsman tourist as one of Cook's famous hand-books to European travellers. Responses to our call are coming in, and so soon as the public realizes what we are doing we anticipate a perfect deluge of information. The first notice of the FOREST AND STREAM Game and Fish Directory may have escaped the notice of some, and we accordingly repeat its essential points.

Our knowledge of the abundance of game in very many sections of the country, gathered some years since by personal investigation and circular letters, we now wish to supplement by the latest and most authentic reports from our readers and correspondents.

Scores of gentlemen sportsmen in our cities and towns annually seek hunting and fishing grounds where they may spend their limited vacation in the sports of the field. There are scores of others who would go in the same way, provided they knew where and when to go. It is primarily for such that we have undertaken to supply a fund of information. We ask those who have knowledge of eligible game and fish resorts to put such knowledge on record at this office, where in turn it may be given either personally or by letter to those for whose benefit it is intended.

An important part of our work is to answer the queries of correspondents about the game of one country and the fish of another. A sportsman sets out on a business trip to a distant State and straightway writes to know if he should take with him rifle, shot gun, or fishing tackle. Another living in Cincinnati is going to Western Texas for his health and wants to know in what part of that country he will find the best sport. And so on through a catalogue which never ends. To furnish intelligent and trustworthy answers to these constant inquiries do we solicit the coöperation of all. The particulars asked for may be put into postal-card space; to give them is a slight thing; to avail one's self of them means a successful expedition for pleasure and health.

For specific details of the reports consult the Game Bag and Gun column.

EDITORIAL NOTES.—"Piseco" calls his letter "another howl from Alaska's desert shore;" but the reader will agree with us that it is a good-natured and most agreeable sort of howl after all. Indeed, darkness, cold, unvaried diet and savage surroundings appear to have had little effect upon our correspondent's happy spirits. We wonder how many of those who have read his charming letters know just how multitudinous and perplexing are the duties of their author away up in that out-of-the-world corner. Something of their unenviable nature may be gathered from these extracts, which we clip from the Alaska *Appeal*:—

Mr. Austin is teaching school, assisted by Rev. N. Mitropolsky, for the Russian language. Capt. Beardslee has assisted the enterprise by engaging an interpreter, Mrs. Kashevaroff, to help Mr. Austin in teaching English to Russian children. Capt. Beardslee deserves the thanks of the community for the judicious manner in which he has used the discretionary powers conferred upon him of giving employment to the deserving.

The commander and officers of the *Jamestown*, now in Sitka Harbor, deserve the highest praise for work of thoroughly surveying not only the vast harbor and bay, but also the mining district adjoining the town, to the great benefit of shipping, commercial and mining interests. Sitka has not been so fortunate since the stars and stripes first floated over the land.

A man named Jack Williams shot and mortally wounded an individual named Teddy the blacksmith, at Sitka. Williams was placed in irons on board of the *Jamestown*. Capt. Beardslee has asked for instructions from Washington. In the absence of all law to sustain him, an officer commanding in Alaska naturally must use great caution, even in arresting a murderer.

That means that "Piseco" must be school commissioner, civil engineer and sheriff; and then there are a score of other equally exacting offices, all of which, we should judge from the *Appeal's* remarks, he is filling with credit and ability.

Archery readers will review with interest Mr. Carver's comments upon the past season. Next week we shall have "Antler's" reminiscences of early days with the bow in the forests and among the Indians.

Prof. Hind's essay upon the spawning habits of salmon is an important contribution to the literature of the subject.

PERSONAL.—Six thousand miles apart, they meet in the FOREST AND STREAM office. We have had the pleasure of a call and the acquaintance of Mr. John Harvey, M. I. N. A., of the well known John Harvey Shipbuilding Co., Wivenhoe, England, designer of the famous *Miranda*, *Seabelle* and *Jullanar*. The fine performances of these vessels are as well known in America as in Europe. Mr. Harvey is now on a tour of pleasure and business combined, and has examined many of our best yachts. As might have been expected, he does not find much to admire in their want of seagoing qualities, and is especially struck with the lack of accomodations below in such large schooners as *Tidal Wave* and *Wanderer*, as well as the poor disposition made of what there is. He informs us that *Jullanar* is an exceedingly dry boat and the ablest sea boat he has ever built.

Mr. J. C. Uhler, S. F. Y. C., from San Francisco, likewise favored us with a call, and reports yachting matters on the Pacific as being livelier than ever, and the S. F. Y. C. in a strong condition socially and financially.

WALNUT HILL AGAIN.—The Boston Range has added, if possible, new glory to itself in the performance of last Saturday, where a perfect score of ten bull's-eyes were made and a record of fifteen consecutive bull's-eyes was the leading one of a fine list of scores. The secret of the success of Walnut Hill is that the men shooting there love the sport, and their enthusiasm is contagious. It is the one place where the hackneyed phrase of a "generous rivalry" finds a practical exemplification. No one hears much of the prizes shot for at this range, and on the range itself it is rather "Who is first?" than the query often heard on other ranges, "What has he got?" While this spirit exists and the leisure is found to enable its working out on the range, there will be no doubt that the best will be heard, and only the best, in connection with that range. Creedmoor has a vast deal of perfunctory practice, and makes only a dull show therewith.

SUNLESS ALASKA.

SITKA, *Dec. 15th*, 1879.

YEARS ago it seems to me, but my diary shows but eight months, I met on "the avenue," as I was hurrying to the depot to catch the "Limited Express," an old friend whom rumor said was as authority on Alaska. "Where are you going in such a hurry?" says he. "Sitka," says I. "The devil," says he. "Yes," says I; "my sentiments exactly! But tell me all you can about it, in just one minute." "Well, then, if you are a sportsman, it's a Paradise; if you ain't, it ain't." And, with "Good-bye, old man," I hurried along, for, although only an amateur, I thought that I had at last some little chance for Paradise. Well, I've been here six months and over, and either I am most emphatically *not* a sportsman, or people's ideas about Paradise are very diverse.

Except for the three glorious days among the ptarmigan, I havn't shot enough game here to pay for bringing my guns. I've tramped on an average a mile each for all the snipe and plover that I've bagged, and probably two dozen ducks will cover my season's work, and some of them were fishy enough to make one forever foreswear duck eating. Early in October we got a few teal and mallard, but they had hardly begun to gather, when there came a "cold wave," and all of the teal and most of the mallard left for warmer climes, and they have not returned. I have shot two grouse early in fall, and that, except for my ptarmigan, fills the account.

When we arrived we heard such tales! We could in fall see in the creeks "solid beds" of salmon, and the grouse and ducks and geese would be so plentiful in fall that shooting them would cease to be a pleasure. Well, fall came, and winter is on us, and now it is in March that we are to revel in game. I am afraid that the inventors of the tales about Alaska shooting, built their stories on the model used by my wife's cousin "Ike," who, when a small boy, was a bright and saucy one, and would swear. Ike and I were frog hunting. Ike suddenly shouted: "Come here, quick; there's more than a million frogs in this pond!" I turned back with a flush of anticipation, but was not so sanguine as Ike. "Haven't you got that a little steep, Ike—that million?" "Well, I wouldn't say there was a million, but there is a thousand." "Down a little lower, if you please, Ike." "Well, there's a hundred, any how." By this time we had reached the pond. "Where's your frogs, Ike?" I asked, as I peered over the alders. "There's a dozen of 'em, wait a minute." But waiting did not reveal them; and Ike answered my rebuking look with, "Well, I heard one jump in, any how, and by his splash he was a ripper, I tell you."

And so it has been with our shooting. I've given it up; my shot gun clad in flannel—no need to grease it here, for our guns never rust—has stood for weeks untouched. And, except for an occasional shot with my rifle at some gull or shag or diver that plays around astern, I should about forget how to shoot.

Some of the younger, more persevering, and more ardent sportsmen than I am, go out now and then, encased in rubber; but when they do return with a bird of any kind (they have stopped bringing home the crows and sparrows, with which when they were beginners they filled their bags), they are immediately suspected of having "met an Indian" and bought the bird, for the Indians do still get some game. They bring no grouse nor ptarmigan—none for nearly two months—no teal, but a few mallard, some butter-balls, widgeon, wood duck, and no end of venison. There are lots of deer to be had, if one could go for them; but when venison takes the place of beef, at six cents per pound, it ceases to be game.

We care as little to go ourselves, to kill and pack in carcasses, lots of which can be seen lying around on each

street corner, as we would to go hunting for mutton. It requires a strong nature, and great powers of endurance and patience, to hunt deer. Two Indians will leave here in their canoe—say, to-day—to-night, if the moon is up, they will squat all night by the side of trails; if the deer don't come to-night, it will to-morrow, or next night. They are as comfortable squatted there as they would be squatted on the beach here, and they can stand the cold and wet and snow, for they have been brought up to it from childhood. When on the mountains I was astonished to see my packers tramp bare-footed on the snow. I have got beyond astonishment at such a trifle as that. We have had three weeks of cold weather, and the lake (Piseco Lake, I have named it), is covered with ten-inch ice, built by a temperature at times as low as 10 degrees. On that ice children and women slide and play bare-footed. And the snow which now covers the ground does not seem to incommode them. Little boys clad in but single blankets slide down hill on bits of board or sheet-iron; and when the board, as it did sometimes, slid out, and the blanket did not slide in, the cold friction did not seem to mar their happiness, and (I can hardly believe it, but) I was told on the ice, by a man who kept a roller-skating rink in Wrangel, that buck Indians would come in barefooted, strap on the skates, stamp in the brads, which project upwards into, ordinarily, the boot—and thus accoutred, seem to enjoy themselves. I think the explanation of this hardiness is "the survival of the fittest." From birth they are accustomed to cold and wet, and those who don't die, get tough. I have seen where the thermometer stood at 20 degrees in the mornings, mothers bringing naked infants to the beach and holding them in the water for several minutes. However, as the temperature of the water was the highest, it may not have been so very bad—for an Indian. But those of us who have not been so hardened, prefer to leave deer-butchering to those who have. I never realized, nor do I believe the most experienced deer slayer among your readers ever did (unless he has also lived a winter in Sitka), how many uses venison could be put to. I've heard old sailors say that in a porpoise there are five distinct kinds of meat, viz., beef, fish, veal, pork and mutton, and some very old-fashioned tars, who have been down among the Fijis, claim that from what "they've hearn," the taste of "long pig" can also be discerned. I never could find these various flavors, but with our venison it is very different. Left to his own resources, my *chef de cuisine* prided himself on giving me in succession, breakfasts of lamb chops, mutton chops, veal cutlets and beef steaks; and dinners of roast venison, beef *a la mode*, and venison pot-pies—all from deer meat, and I admired his skill; but by last steamer a French butcher came here and opened a shop, and he has developed unthought of deliaccies. My breakfasts now have heart, liver, sausages, blood pudding and tripe added to the *carte*; and brains, "mountain oysters" and pickled tongues set forth at my evening's repast—all good.

Two years ago dear carcasses brought from one to three dollars, according to size; now the demand is such that they are worth and bring from five to eight. Occasionally we have halibut, rock cod, or flounders, the only fish attainable; all very good, and far more toothsome than their congeners in the Eastern waters. The flounders resemble in flavor the "Rusty, or Norway flounder," a fish plentiful off the coast of Norway, and as plentiful off our own coast, yet it remained unknown until two summers ago the Fish Commission steamer found by hauling trawls in deep water, between the inner and outer banks, that this valuable fish could be procured in quantities. We get no codfish here; there is now and then a fish called a codfish, but it is a different family. There are though, as I have told you in previous letters, good cod fishing banks thronged with the genuine article in Alaska waters. From the Shumagin banks eight vessels captured and carried to the San Francisco market during the season of '79, 656,000 fish, and the previous season 524,000, averaging probably ten pounds each. There is in San Francisco a ruinous competition between three firms to monopolize the fish trade, and prices are kept so low that no outsiders dare venture in.

We are having a little sensation now over the apparent probability that in a few years one great production of these Northern seas may become exhausted—there is the most ruthless slaughtering going on among the walruses. It is estimated that at least 35,000 pounds of tusk ivory will have been secured this season; the tusks weigh on an average perhaps ten pounds per pair, for as many half grown as grown animals are killed; thus at least 3,500 walruses have been captured, and certainly a large percentage wounded has escaped to die. The total value of the ivory brought in is less than $4,000, it not being worth over ten cents a pound. It will not take long to exterminate these creatures, as the fur seals have been from all but a very limited locality. And to the dwellers on our Aleutian Islands the extinction of the walrus means simply starvation, and here's where my interfering in the matter comes in. Lots of our friends in Sitka are closely connected with families dwelling among the islands. I understand that the Lands Officer of the *Richard Rush* revenue cutter has made a full report on the subject.

As I glance over this letter I find that it takes in a shape that may well be termed "Another howl from over Alaska's desert shore," and I don't know any reason why it should not be. It's nearly six weeks since we got our last mail, which was then three weeks old, and of the six fully four weeks have been cursed with the gloomiest, darkest, rainiest, chilliest, blue-devil-inspiringest weather one can conceive of. And we have simply existed and grown morbid, and amused ourselves by fancying all sorts of unhappy events occurring at home.

Even our mining fever, that for a time kept us animated, has worn down terribly. The mountains are of course covered with snow. Nothing is being done at any of the mines except the Stewart, and we get no new bricks to stir us up. In spring if, as we anticipate, there is a "boom" here, we will probably have another spell, but just now we are in the dumps. On the 19th the first steam mill in Alaska started to crush ore at the Stewart, and in a week has produced, I am told, about $1,400 worth of bullion. Some assays of the Great Eastern ore have been obtained, running up to over $300 per ton. There is absolutely nothing more to add to this letter worth the space it would occupy in your columns, so *au revoir* until brighter days. PISECO.

P. S.—The sun got up this morning (at least I suppose he did; I haven't seen him, and now at noon am writing by lamp light) at 8.44 A. M. and will go down again—and he may go for all the good he does in the meantime—at 3.15 P. M. And he will continually grow worse in this respect until the 22d, when he will give his culminating effort by furnishing us with a day just six hours and thirty-four minutes long. From that period he will improve gradually until next summer, when we shall again enjoy days of eighteen hours.

GAME PROTECTION.

MIGRATORY QUAIL.

BOSTON, *Jan.* 22.

IN accordance with a promise made in your paper of December 25th, I herewith publish Mr. Braun's prices for migratory quail to be shipped in the spring of 1880:—

For one cage containing 100 migratory quail,	$	35 00
For ten cages " 1,000 " "		325 00
For forty " 4,000 " "		1,200 00

Mr. Braun agrees to put one hundred live, healthy birds into each cage, to mark the address in full upon the cage, to deliver it on board the steamer, to provide abundant food, to pay the steward for caring for the birds, to pay the freight to America, and to ensure the purchasers against loss from shipwreck. After this they are at the risk of the purchaser. Judging from the success of our shipment of last year this risk is small, as the loss of birds in that importation was only one per cent. The smallness of this loss is due to the great care taken in selecting and boxing the birds. Upon this point Mr. Braun writes as follows: "I always keep the birds for about ten days before putting them on board, so that they may accustom themselves to the cages. If they were shipped the same day they were brought in from the country, or a day after, the proportion of loss would be much more considerable. Before putting the birds on board I select all those which seem to have got hurt when caught, so that all birds are shipped in perfect health."

The cages in which the birds are put are boxes five feet long, seventeen inches wide, and four and a half inches high. The top of the box is made by stretching across it a piece of jute cloth, in which are two hand-holes, closed by gathering strings. The birds are thus prevented from injuring themselves by flying against the top of the box. This long box is divided by a transverse partition into two parts, each of which contains fifty birds. By means of the hand-holes any bird that may die on the passage is easily removed by the steward, and the live birds are taken out readily upon reaching their destination. The box has a grated front, made by vertical wires standing three quarters of an inch apart, between which the birds can thrust their heads to reach the food and water in a long trough nailed to the box in front of the grating. In this way the food is kept clean and the water cups are not overturned. The thorough adaptation of this box to its purpose is shown by the admirable condition in which last year's importation arrived, there being, as nearly as could be ascertained, a loss of only about thirty birds in a shipment of over 3,000. The live birds were apparently as tough as hickory nuts, and so tame as to feed from the hand. It was a pretty sight to see the hundred little heads, with their shining eyes, thrust through the grating when food and water were put into the trough.

Returning to the matter of prices, I say that it is pretty evident from correspondence already received by me that orders enough will go forward to Mr Braun, through me, to make the entire shipment more than forty cages, and so to secure for all the benefit of the lowest price. The price then for the birds, shipped to New York with all expenses of the passage paid, will be thirty dollars per cage; but as the flights are uncertain, being sometimes very small, and as the shipments to England and France this year will doubtless be large, in view of the fact that there is danger of an Italian law being passed forbidding exportations after this season, Mr. Braun reserves the right to return the money if he shall be unable to procure the birds without loss to himself. This however is not likely, and there will be probably an abundance for all demands if the flight is ordinarily large.

Since this may be the last opportunity to introduce the migratory quail into America, I now, in order to induce as large an importation as possible this year, repeat the offer made in a recent issue of yours, to wit: I will take charge of an importation of quail, and will give my services, free of charge, to any gentlemen who have not facilities or time for managing their own importation. All the responsibility that I assume is as follows: 1st. I will forward all the orders as one general order, so that the price to each gentleman will be the lowest wholesale price, namely, thirty dollars per cage, even if he orders only a single cage. 2d. I will receive the money that is sent to me with the order, will purchase foreign exchange with it, and will forward the same to Mr. Braun, with such instructions for labelling the cage with purchaser's address as may be given to me. 3d. Upon the arrival of the birds in New York I will see that they are passed through the Custom House duty free (unless there is a change in the tariff, which is not likely), and will also see that they are delivered to the express companies to be forwarded to their respective destinations. Gentlemen ordering will please name express company, if they have any choice, by which the birds are to be sent to them. Orders and remittances should be sent in at once. The flight reaches Sicily about the middle of March, and Mr. Braun must have time to make his arrangements with the catchers before the birds arrive. The birds cannot be furnished excepting in boxes containing one hundred birds each. Orders must therefore be made for even hundreds only.

Any gentleman desiring to import outside of this combination will doubtless receive full and courteous attention by addressing Mr. Carl F. Braun, care of U. S. Consulate, Messina, Sicily. HORACE P. TOBEY.

17 *Oliver Street, Boston.*

MIGRATORY QUAIL.—*Belvidere, N. J., Jan. 21st.*—The migratory quail imported last spring (one hundred), ninety of which were received in good order, were released in lots of from fifteen to twenty in a place, mostly on adjoining farms. Out of this importation it has been ascertained that only three covies were hatched. One of sixteen remained here as late as the 16th of November; at least I know of their being on the farm near where they were liberated as late as the above time. Very few of the old birds could be found this fall. I have heard of four or five being shot by sportsmen mistaking them for our native "Bob White's." ISRAEL HARRIS.

PROTECTION IN MONROE COUNTY.—*Rochester, N. Y., Jan. 20th.*—Our Board of Supervisors are debating a law for this county that will prohibit duck shooting except the three last days in the week, and prevent woodcock, quail and grouse shooting for three years. I suggested the clause relating to ducks, for I believe it would give us good shooting on the bays and ponds of this county, where it is now poor, but was formerly unsurpassed. I was in hope the Supervisors would have limited the prohibition of duck shooting during the first four days of the week, to the towns of Irondequoit and Greece on Lake Ontario, where the only waters are situated that any number of water fowl frequent. I drew up a bill for that purpose and had it introduced before the Board. But I soon found that, like the historic individual who released the genii, I had started a power I could not control, for the county law makers went on amending my bill until I now hardly recognize it. I deem it nonsense to prohibit woodcock shooting here, since they migrate, and birds that are bred in this county may be shot in Louisiana. If all would observe the quail and grouse clauses of the law it might do some good, but I think unscrupulous pot hunters will reap the harvest, law to the contrary notwithstanding. The Supervisors are also debating a fish law to protect in local waters fish from netters. The debate is bitter, but I think the friends of protection will prevail. DIVING DECOY.

The Rifle.

MASSACHUSETTS—*Hopkinton, Jan. 22d.*—The rifle club held a match at their range at Claflin's Grove last week. The weather conditions were favorable and the light very good. The conditions of the match were 200 yards, off-hand, 10 rounds, reëntries being permitted. Below is the summary:—

N. Jewell	4	4	5	5	5	5	5	4	4	4—45
W. B. Claflin	3	5	5	4	3	5	5	4	4	4—42
C. A. Sumner	3	4	3	4	4	4	5	4	4	5—40
F. S. Phipps	3	5	4	5	3	4	3	3	5	4—39
Re-entry	5	4	3	5	5	5	4	4	4	4—41
G. P. Woods	2	2	5	4	4	4	3	4	4	4—36
Re-entry	2	3	5	3	4	4	4	4	4	4—37
C. A. Frost	4	3	3	4	3	4	4	3	3	4—35

Boston, Jan. 23d.—This week at the Mammoth Rifle Gallery has been the best of the month for brilliant shooting. Mr. J. Merrill made a clean score of eight bull's-eyes and received $20 in gold for the same. This is the third time he has accomplished this feat, and begins to think the Mammoth Rifle Gallery is a gold mine. The following is the summary to date; 150 feet; rounds 8; possible 40:—

				Total.
J. Merrill	39	39	40	118
N. W. Arnold	39	39	39	117
W. H. Harrison	39	39	39	117
W. H. Jackson	39	39	39	117
U. A. Pollard	39	39	39	117
E. B. Souther	39	38	39	116
N. C. Stone	38	39	39	116
E. Walters	37	38	39	114
E. F. Richardson	37	38	39	114
George Hub	37	38	38	113
A. L. Eames	39	36	37	112
E. Bent	38	37	37	112
A. E. Robbins	38	37	37	112
J. Ames	37	37	37	111

The New Year rifle match closes on the 31st, and next month a new match, called the "fifty dollar rifle match," will commence, and continue during the month; conditions same as this month's match.

Boston, Jan. 24th—Walnut hill to-day had one of those glorious bits of weather for the riflemen that has made it so famous. An added glory was the honor of having some of the crack shots from New York to participate in the day's sport. W. M. Farrow, the finest shot in the world, who already having made a full score, honored Walnut Hill, and added to his well earned fame by putting up another full score of ten shots. His first five shots on his re-entry were bulls, so he made 15 straight bullseyes, or a full possible of 75, which is most wonderful shooting, and places him the king at 200 yards, hip rest. His companions of the Empire Club, F. T. Holton, A. Hubbell, T. Fitz, C. J. Falco and J. W. Todd, shot well, and every one had a good time. The Walnut Hillers will try to make it pleasant, and will be pleased to see more of the riflemen from other clubs. J. N. Frye, Esq., the President, was in his element having a good

word for all, with no loss of time in the pleasure. The home riflemen did fairly well. Charles made a fine 47; Jackson uses a military, and by the rules has two points added to his score. Sumner, the reliable, put in four 46s. The other well known names kept the reputation of the Hill up to the mark. There were 154 entries. We give the leading scores:—

W. M. Farrow	5	5	5	5	5	5	5	5	5	5—50
V. Enicz	5	5	5	5	5	4	5	4	5	4—47
W. Charles	5	5	5	5	4	4	5	5	5	4—47
W. H. Jackson	1	4	4	4	5	4	4	5	5	5—46
J. S. Sumner	4	4	5	5	5	4	5	5	4	5—46
J. Nichols	4	5	5	4	5	4	4	5	5	4—46
W Howard	5	4	5	5	5	4	5	5	4	4 46
F. H. Holton	5	4	5	5	5	4	4	4	4	5—45
A. Bubbett	4	5	4	5	5	4	4	4	5	5—45
T. Fitz	5	4	5	4	4	4	5	4	5	5—45
E. F. Richardson	5	3	5	4	4	5	5	5	5	4 45
C. S. Noyes	4	4	4	5	4	4	5	4	5	5—44
C. J. Fales	5	4	5	5	4	4	5	4	4	4 44
C. R. Griffing	4	5	4	4	5	4	4	5	4	5—44
E. Bennett	4	4	5	5	4	4	4	4	5	4—43
J. W. Todd	4	5	4	4	4	5	4	5	4	4—43
J. Borden	4	4	4	4	5	4	5	4	5	4—43
C. H. Russell	4	5	5	4	5	4	4	4	4	4—43
T. E. Garden	3	4	3	4	4	5	5	5	5	5—42
G. Lewis	4	4	4	4	4	4	3	4	4	3—38
F. Earnest	3	4	4	5	4	4	3	4	4	3—38

THE EMPIRE TEAM AT WALNUT HILL.—*New York, Jan. 26th—Editor Forest and Stream*:—Will you allow the gentlemen of the Empire Club, who visited the Walnut Hill Rifle Range on Saturday last, to thank President Frye and Secretary Rockwell and the members of the Massachusetts Association for their attentions and courtesies, which were so kindly extended on that day. The team voted it the most enjoyable day's sport in its experience, and can only deplore the apathy of our N. R. A. that they do not build a "winter shed" and give us an opportunity to keep our practice up during the winter months. W. MILTON FARROW,
Captain of Empire Team.

UNION HILL.—At the annual election of the Board of Directors of the Schuetzen Park at Union Hill, N. Y., the following gentlemen were chosen for the position: A. Brieglieb, H. W. Cordts, John C. Crevier, J. N. Crusins, Wm. Engel, Aug. Ermisch, Fred'k Hansen, Fred Harenburg, Zac. Heinz, D. H. Helms, John Horsmann, John Koster, E. P. C. Lewis, J. F. W. Mangels, Chas. F. Mattlage, John. E. McWhorter, Bern. Meyer, J. H. Miller, Wm. J. Mohn, Wm. Müller, H. F. Neumann, Henry Offermann, Rud. F. Rabe, W. F. Schumann, Martin Steljes, Henry Wellbrock.

HELVETIA RIFLE CLUB.—The programme for 1880 of the old Helvetia Club has in it plenty of work for the members. The precision shooting is at 200 yards distance, ⅔ inch ring targets. Each member is allowed a maximum of three tickets (ten shots each) from January to October inclusive, at the official places and on days to be designated. The total number of points, hits and tickets of each shooter forms his aggregate for the year. In case of ties, precedence is given to (1) points, (2) hits, (3) tickets.

Rifles are divided into—*a*. Breech-loaders.—No interruption allowed and rifles not to be cleaned while shooting a ticket. Artificial rest, weight over fourteen pounds, and calibre over .45 forbidden; no discrimination made in regard to trigger and sight. Only finished cartridges allowed.—*b*. Muzzle-loaders.—This division will be opened only on application of not less than five members.

The time shooting will be at 200 yards distance, Creedmoor targets. Five minutes allowed to each member for each of the months mentioned, to shoot on one day without intermission, without leaving the stand and without cleaning the rifle. Repeating apparatus not to be used. Rifles above twelve pounds weight, and over .45 calibre, and carbines not allowed. The number of points, hits, and shots to form the year's aggregate of each shooter in time shooting, and in case of ties precedence is given to the highest number of (1) points, (2) hits, (3) shots. The shooting festival will be held in Oct. 1880; to last one day. The gold medal presented to the club is to be the first prize of the time shooting, and considered the champion medal for the season. The officers of the club are: Albert Moyer, President; J. Huber, Secretary, P. O. Box 1626. The Shooting Committee consists of August Knoepfli and Robert Faber.

EMPIRE RIFLE CLUB.—The annual election of the Empire Rifle Club, held Jan. 22d, resulted as follows:—President, Dr. H. F. Clark; Vice-President, Frank H. Holton; Secretary and Treasurer, Jas. W. Todd; Executive Committee, W. M. Farrow, A. H. Cobb.

FISHER'S GALLERY.—The All-Comers Match for championship gold medal was ended at Fisher's long range gallery, No. 381 Fulton street, Brooklyn, on Tuesday evening, Jan. 20th, Mr. T. P. White winning with three scores of 48 each in the possible 50, at reduced 200 yards range. On Jan. 24th, in the Saturday night match, J. S. Case led with a score of 111 in the possible 125 at same range.

A PENNSYLVANIA RANGE.—*Philadelphia, Jan. 21st.*—Rifle shooting in Pennsylvania promises to open with a boom in spring. What we have long required here is a good long range—the riflemen generally objecting to using Stockton Range in Camden because it is a Jersey concern, and they rightfully think Pennsylvania riflemen should have a range in their own State. The League have this in charge now, and I think I can predict a good range for our use within a few weeks. The different railroads are pushing to have the range located on their line of road, and several are being considered. The money for improving a range is offered, so that, all things considered, I think next season's shooting will be more favorable than ever before. B.

—The *Daily Oregonian*, in its issue of Jan. 3d, reports a contest on the Pioneer Range in Portland at 30 yards, with a bull's-eye ¾ inch in diameter, in which M. F. Spencer made a score of 42 bull's-eyes and 6 ruffers, making a total of 570 points out of a possible 576; the bull's-eye counting 12.

EXPRESS BULLETS.—*Editor Forest and Stream*:—The very interesting letter of your correspondent, "Rabbeth," has prompted me to offer the following remarks as the result of several years' experience in the use of express bullets. The momentum or striking force of any bullet is in direct proportion to its velocity; but if of the ordinary form, it is at high velocities likely to pass entirely through the animal, and thus the blow or shock inflicted is only that due to the difference between its momentum at entering and its momentum at passing out. All the force which is expended in carrying it beyond the point of exit is wasted. Now the peculiar form of the express bullet causes it to spread out upon impact with the animal, and it rarely passes through, thus imparting the whole of the effect of its momentum at the place where it is needed. I use a double-barreled rifle made by Scott, of Birmingham—.50-bore, charge of powder 110-grains (4 drachms), bullet about 340-grains, and I have never had a bullet pass through a deer. It is usually much battered, and if it encounters bone it is frequently divided into fine fragments. In one case some of these fragments cut the skin on the opposite side of a deer's chest, but they remained in it. It strikes a fearful blow, and the shock usually kills at once. It was once my fortune to shoot two deer with right and left barrels; one dropped dead and never stirred; the other got up on his hind legs, moved them around in a circle and fell again, dead. Both shots were in the shoulders, and the bones and soft parts were broken and torn extensively. The instantaneous death was to be attributed, however, in a great measure to shock. I cite this as a good illustration of the kind of work to be looked for from the use of the express bullet. The full effect of its high velocity is expended in the game and it makes a deadly wound. Mr. Rabbeth's experiments show the great need of careful manufacture in order to ensure accuracy of flight, and should be heeded by the companies who have commenced to furnish them. My bullets are of English make, but I have cast a few in the mould that came with the rifle, and after forcing them through a small swage (also furnished with it), I have found them to shoot equally well with the imported ones. The rifling of the gun is after the Henry pattern and seems well adapted to give accurate shooting with large charges and the express bullet. The convenience of the flat trajectory attained is very great. Within one hundred yards the bullet scarcely falls at all, and in practice I seldom avail myself of the single leaf that elevates it for distances up to two hundred yards, making the requisite allowance of a few inches in my aim. In conclusion, I express the wish that out of the many using rifles for hunting, there may be a goodly number found willing to experiment with the express bullet. I am sure that it will at moderate ranges improve the killing power of most if not all rifles. C.

RECOIL IN RIFLES.

For the past four years I have been experimenting and shooting with rifles a great deal. The recoil of long-range rifles has been a very unpleasant feature in their use for me. I wish to be understood as writing only of breech-loading rifles, rim, centre fire or shell. In my shooting I have used four rifles and two shot guns, all of nearly the same weight—9½ pounds. Now, finding the recoil of a breech-loading rifle, charged with 2½ drachms of powder and three-quarters of an ounce of lead, more unpleasant, on account of recoil, than my breech-loading shot gun of exactly the same weight, charged with 4 drachms of the same quality of powder and 1⅛ ounces of lead, and also wads, I concluded that there must be some point or points wrong in the construction, or rather in our way of loading the breech-loading rifle.

I had once used a muzzle-loading rifle, shooting a heavy slug bullet with immense force with scarcely any recoil. This rifle weighed eight pounds. On comparing charges I found that with the same charge any of my 9½-pound breech-loading rifles "would kick like an army mule." My theory was that, in order to charge the breech-loading rifle with facility, the chamber for the cartridge had to be large enough to admit of the bullet being shoved into its place easily. The diameter of the chamber where occupied by the ball is much greater than the rifled part of the barrel immediately in front of it. The result is that when the cartridge is fired the concussion of the powder when exploding "up sets" the bullet, increases its diameter to the size of the chamber, and then forces it into the rifles, where the diameter is much less. This takes immense force, and gives tremendous tension to the gases of the burning powder. No wonder the arm "kicks." The bullet is first swollen, and then after starting it is forced into the rifling. The wonder is that the concussion does does not mash things generally.

Was this theory of mine correct? I had the means at hand with which to readily solve the problem, to wit, a Ballard rifle, .40 calibre, charge, 70 grains powder, 365 grains of lead, and one of .38 calibre, using the common cartridges. The weight of the gun is 9½ pounds. A cartridge .38 long has 16 grains powder and about 200 grains lead; .38 extra long 24 grains powder and 200 grains of lead. This rifle, with the last named cartridge, gave a recoil somewhat unpleasant. For my experiment I primed a lot of centre fire copper shells: I then took a 365 grain hardened patched Creedmoor bullet and drove it from the breech into the rifle, then put in 40 grains of powder, then the empty primed shell, turned the rifle breech down and settled the bullet firmly on the powder, fired the charge—no recoil; tried the same bullet with 50 grains powder—no recoil; with 60 grains—no recoil; with 70 grains gave a slight push like a shot gun; 80 grains, a little more of a push but not unpleasant, not nearly as much so as the same gun loaded with cartridge with one fourth the amount of powder and one half the weight of lead. With the extra long cartridge the recoil is a quick, sharp blow, but loaded as above it pushes like a shot gun. I fired several rounds with each of the above loads and made the best score I ever made, and although I made no full test for penetration, I am confident that I got greater force than in the ordinary way of loading; and I am also confident that one can shoot 110 to 120 grains of powder in this way with as much comfort as he can 50 grains by the regular way of loading, and not be any more straining on his rifle. To drive these bullets into the rifle from the breech I used a tough hard-wood pin, and was surprised to find that it took three to four good sharp blows with a heavy hammer to start them in. When once fairly in the grooves they could be easily shoved either way.

Therefore, if my experiments are correct—and I think they are—the nervous marksman who could shoot a long-range or Creedmoor rifle well if it didnt "kick," may overcome this trouble by having his rifle built, chambered for a short brass shell, then have a plug with a shoulder to it with which to drive in the bullet just far enough to admit the powder he wishes to shoot; fill up with powder behind the ball until flush with the breech of the barrel; insert the primed shell, close the action, and blaze away. No dodging necessary. This way of loading would only be practicable when targeting. When sporting, we rather like to be "kicked."

About Everlasting shells, we have had the same troubles with these as "Bexar" and others complain of; with us they have swollen, burst, stretched, and were a nuisance generally; but I think I have traced the troubles all to one cause, namely, settling the bullets too far into the shells. The least distance they are shoved into the shell, the better every way—just so they will hold. At least, we have had no trouble with any make of rifle shells since we have practiced this plan. The best way to load a shell rifle for sporting is to fill the shell with powder; force a paper wad into it, so it will be flush with the mouth of the shells; carry your bullets separate, and when you load, drop the bullet in the breech, and shove it to its place with the wadded shell; and my experience proves if you would so shove it fairly into the rifle, better shooting every way would result. BYRNE.
Lucon, Ill.

MORE SHELL TALK.

Editor Forest and Stream:—I have read with interest all the correspondence relative to the everlasting and folded head rifle shells, and I did not suppose that anything could be said upon the subject that would make me take up the pen. But your correspondent, "Magazine," is evidently a shell manufacturer and somewhat prejudiced. He condemns the everlasting shell because it is not elastic. The only reasonable argument against the everlasting shell I ever heard, was that it was too elastic, and with heavy charges would elongate so that the bullet would be nipped as it left the shell.

My experience with folded head shells has been considerable, and I find that after, on an average, half a dozen discharges, they begin to split in the head, and frequently the heads will be blown completely off, and the brass reinforce or cup in the head of the shell, smashed as if struck with a hammer. This is a Remington Creedmoor. A Sharps Creedmoor I know of don't blow the heads off, but splits the shell under the head and towards the mouth. A Berchardt Sharps, using the folded shells, bursts them in head same as the Remington, but the heads do not blow off. After several hundred shells have burst in any gun I am of the opinion that the gas which escapes at the bursting of the shell will cut the recess in the rifle for the shell head, so that the heads of these thin shells will be blown off every time. I will prove it with any person interested, provided they will buy me a new barrel to my gun.

I have used in a military rifle hundreds of solid head shells made by the United States Cartridge Company and the Winchester Company, new and reloaded, and never had one burst or crack. A friend of mine who did have the heads of several shells blown off, reported it to the manufacturers, and they promptly acknowledged that the quality of the brass was poor and the lot of shells were sold by accident.

Now in relation to the everlasting shells. I purchased a Ballard rifle second hand, with fifty shells which had been used several seasons. The gun has been shot repeatedly since I purchased it and each shell fired at least fifty times with 90 grains of powder and 520 grain bullet, and the shells have never expanded, stuck, or done anything but what they were intended for. The only sign of wear they show is, the anvils are smashed a little from the blow of the firing pin. Recently a gentleman purchased a Ballard rifle with fifty of the everlasting shells, same size as those with the gun I purchased, and the owners commenced to use the shells together; the result was that some of the shells expanded and would not go into the gun and had to be laid aside. The indiscriminate use of shells was then abandoned, and since then there has been no trouble. I have a Ballard rifle, 40 calibre, with everlasting shell; the shells have been used over a hundred times with all kinds of fitting bullets, some so tight that the shells had to be driven in the rifle with a mallet so that the breech block could be closed, and I never had one shell expand, burst, or blow the heads off.

I am not a gun maker nor even a mechanic, but my view of the case is that the chambering of the rifle is most if not always the cause of the trouble.

The Sharps Company say in their catalogue that they have made expensive and elaborate tests of these so-called everlasting shells, and reject them because of their liability to split; but say that the folded head ones will last for a hundred discharges. All the experts I know of who use the Sharps rifle use solid head shells, and if they will ask the marksmen who have made the best scores with their gun they will find that the Winchester solid head shell is preferred to the folded ones, recommended by the company.

Another objection to the folded head shell is that when they are cleaned the water gets in back of the reinforce or cup, and it may take several days to thoroughly dry them. Should they be reloaded while not thoroughly dry, the dampness which is contained in the shell will dampen the powder charge for half an inch or more and destroy the force of the powder. That may be the cause for many of those unaccountable drop shots long range men sometimes get.

So far in this discussion we have had only opinions, probably prejudiced ones at that. I cannot say that my contribution cannot be classed with the others, though I have tried to state facts. My facts may be wrong, but they have left the impression upon me which I have tried to communicate to you in a plain way. After all, I hope that somebody or a company will make tests of this shell matter and give us the tests along with the results; then we will know whether the tests or shells fail.
Albany, Dec. 16th. GOOSE EGG.

Editor Forest and Stream:—

We have watched with increasing interest the discussion in your columns of the everlasting shell, and wishing to hear a full expression of opinions, we have deferred writing you till the present. We know that the everlasting shell as now made is a perfect article, and we have samples of them that have been fired hundreds of times without bursting or swelling, and still go into the chamber and out as easily as when first tried. Since the discussion opened in your columns we have had a number of letters from parties not accustomed to appear in print, certifying to the excellence of both shells and

rifles; also expressing readiness to furnish names of any number of parties who have had the same experience. We know that the demand for the style of rifles that use everlasting shells has greatly increased, and that in the same localities where they have been used for several years. We will be happy to correspond with all sportsmen who have any trouble with their shells, and think we can remedy any difficulty they may have had. Trusting that the subject has now been fully ventilated, and as we offer to correct the difficulty wherever found, it will only be those that have some ulterior object in view who will not first write to yours very truly,

SCHOVERLING, DALY & GALES.

No. 84 Chambers Street.

OREGON—*Portland, Jan. 3d.—Editor Forest and Stream:*—I have a fine Schutzen Ballard Rifle, 40-65, which I find very annoying to shoot, as the everlasting shells expand and cannot be removed by the extractor. My trouble is just as stated by "Bexar." The shells work well for two or three times, when they expand so that they can scarcely be used, Can you suggest a remedy? I am only using 50-grains powder and a 285-grain bullet. I should like to have some of the Ballard champions come to the front and suggest a remedy. I think there is no better shooting gun in the State, and it cannot be surpassed for beauty and excellence of finish, and I will regret very much if I have to give it up on account of shells sticking. M.

Game Bag and Gun.

GAME IN SEASON IN JANUARY.

Hares, brown and gray. Wild duck, geese, brant, etc.

FOR FLORIDA.

Deer, Wild Turkey, Woodcock, Quail, Snipe, Ducks, and Wild Fowl. "Bay birds" generally, including various species of plover, sand piper, snipe, curlew, oyster-catcher, surf birds, phalaropes, avocets, etc., coming under the group *Limicolæ* or Shore Birds.

GAME AND FISH DIRECTORY.

In sending reports for the FOREST AND STREAM Directory to Game and Fish Resorts, our correspondents are requested to give the following particulars, with such other information as they may deem of value; State, Town, County; means of access; Hotel and other accommodations; Game and its Season; Fish and its Season; Boats, Guides, etc.; Name of person to address;—after the following model:—

IOWA.—*Pomeroy*, Calhoun Co.—Reached by Illinois Central Railroad; twenty-seven miles west of Fort Dodge. Hotel, Pomeroy House, Alex. Lockie, proprietor; $7 to $12 per week; good livery at reasonable rates. *Fishing.*—At Twin Lakes; distant five miles south, pike, bass, perch, buffalo, and cat, June 1st to Nov. 1st. *Game.*—In fall, from Sept. 1st to Dec. 1st, ducks, geese, cranes, snipe, grouse, and quail; also ducks, geese, snipe, and plover, during March and April. Address as above, R. M. Wilbur, or Alex. Lockie.

DELAWARE.—*Georgetown*, Sussex Co.—Reached from New York via Old Dominion S. S. Co., to Lewes, Del., thence sixteen miles by rail; or from Philadelphia, by P. W. & R. R. R. (Baltimore Depot), "Brick" Hotel, Robert A. Rosenbaum, proprietor; $2 per day. *Game.*—Quail season from Nov. 1st. to Feb. 15th. Double team with driver, $4 per day. Address R. A. Rosenbaum as above.

NEW YORK.—*Hammond* St. Lawrence Co.—Chippewa Bay is reached by steamer from Alexandria Bay or Odgensburg. Good fishing for muscalong, pike, pickerel, bass. *Game.*—Geese in the fall, Nov. 15th; in the spring, April 10th; not very plenty. Ducks in the spring plenty; in the fall not very plenty. Good ruffed grouse shooting; plenty of woodcock; have never been hunted; golden plover, plenty Sept. 1st to Oct. 15th. Boat and guide $3 per day. Hotel or private house, $5 per week. Address as above, A. Schermerhorn.

SPORTSMEN IN COUNCIL.

THE following notice recently appeared in the daily papers of Brooklyn, N. Y.:—

TO THE SPORTSMEN OF KINGS COUNTY.—At the convention of the State Sportsmen's Association at Rochester, in July last, a strong sentiment was expressed in favor of holding the meeting for the year 1881 in Kings County. To accomplish this result joint action of the several local clubs is desirable. It is proposed that an opportunity be afforded every member of each organized club on Long Island to express his views upon the subject at a meeting to be held at Cleaver's light-house inn, corner of Putnam avenue and Downing street, on Monday evening, January 26th, at 8 o'clock. A large attendance is requested.

The meeting was largely attended by prominent representatives of the Fountain Gun Club, Long Island Shooting Club, Brooklyn Gun Club, Nassau Gun Club, and the Long Island Forresters' Club. The meeting was called to order by Abel Crook, Esq., who read the above call; and Mr. George A. Chappell, who is a member of nearly every club in the county, was unanimously elected President of the Association. Upon taking the chair he thanked the gentlemen for the honor conferred, and said that any mistakes he might make would be mistakes of the head and not of the heart. He said that before him he saw at least four clubs of which he was a member, and he wanted to meet them all at Seneca Falls this year.

The Vice-Presidents elected were Dr. Aten, of the Brooklyn Club; Dr. Winn, of the Long Island Club; Mr. Wm. R. Selover, of the Nassau Gun Club: Mr Chas. Fiske, of the Fountain Gun Club; Mr. Wm. Walsh, of the L. I. F. Club. Abel Crook, Esq., was elected Secretary, and Mr. James White, Treasurer. Mr. Crook stated that the object of the meeting was to consider with care several questions, first of which was as to whether the clubs really wished to have the annual convention of the New York State Sporting Association held here in 1881, and to that effe he offered the following motion: That the sense of the Kings County sportsmen be that they invite the New York State Sportsmen's Association to meet here in 1881. Mr. Crook remarked at length in relation to the amount of good it would accomplish in this section by having the meeting held here, and he thought if it could be accomplished that it would put new life and vigor into our sportsmen, and our game laws would be more rigidly enforced. Captain Elmendorf stated that he was one of the delegates to the last convention, and spoke as to the benefits to be derived, and also referred to the amount of money necessary to be raised and the hard work to be done in order to properly entertain their guests, providing that they could be induced to favor them with the convention. Mr. Crook explained that gentlemen present were ready to contribute a sufficient amount to entertain their proposed guests, and in that relation he would state that Mr. George A. Chappell would, if necessary, place $2,500 towards raising the necessary amount, and he did not doubt but that from $4,000 to $5,000 could be raised without leaving the room. Mr. C. W. Wingert also offered liberally. Dr. Winn said he was not present at the last convention, but thought the present action a little premature. Remarks were also made by Dr. Aten and others. The motion was unanimously passed. The Chairman then remarked that the doors were open for other clubs to join this Association. Mr. Cook moved that an executive committee of five be appointed from each club who may see fit to come in, and to report such action as may be desirable. Dr. Aten added that each club should appoint their own committee; passed. Voted that at the adjourned meeting the chair shall appoint such names as are recommended to him, but if none are named he shall fill the vacancy. After a banquet, liberally supplied by the host, of which the particular savory dish was the terrapin soup, the meeting adjourned to meet on Thursday evening, Feb. 19th, at the rooms of the Long Island Gun Club.

STANDARD SIZE OF SHOT FOR TRIALS.—In making trials of pattern and penetration it is desirable in order to compare the work of one gun with that of another, to fix upon some uniform basis. We have already given the conditions of charge and distance, and repeat them here: distance, 40 yards; target, a 30-inch circle; charge of shot, 1¼ oz. No. 7.

The English No. 6 is uniformly used in England for such tests, and by such uniformity of conditions the results of various trials may be intelligently compared. This English No. 6 contains 268 pellets to the ounce. The American No. 7 is the nearest to this, and it is therefore the No. to select. Tatham's No. 7 contains 291 pellets to the ounce; the Leroy No. 7, 278 pellets to the ounce.

Pattern of cylinder bores, above conditions, should approximate 110 pellets, choke bores, 180 to 200.

FOUNTAIN GUN CLUB—FESTIVITIES IN THEIR NEWLY-FURNISHED ROOMS.—On Thursday evening the members of the Fountain Gun Club and their friends came together at the club rooms at Harry Miller's, 449 and 451 Flatbush avenue, Brooklyn, to inspect their new furniture and decorations. A number of the members interested themselves to provide a suitable meeting place for the club without calling upon their treasury to bear the expense. The foremost of these gentlemen were Messrs. Wingert and Chamberlain. At the State Sportsmen's Convention at Rochester last summer, Mr. Wingert won an elegantly embroidered India scarf or shawl. This he donated to the club to be disposed of, and the proceeds to be applied to the furnishing of the new room. A subscription list was started, and it was determined that Mr. Thomas Denham was entitled to the shawl. The example of Mr. Wingert was contagious, and Denham on his part donated the shawl to the club. Meanwhile the improvements were progressing. On the opening night the new subscribers declared that Wingert should have the shawl, but again he presented it to the club, which still holds it. It has proved the means of raising all the funds necessary to give the club members beautiful apartments. Fifteen persons applied to become active members, and there were nominated as honorary members: Hon. Calvin E. Pratt, Supreme Court Judge; Maj.-Gen. Henry W. Slocum, Hon. John B. Haskin, Edwin V. Welch, Esq., Col. Charles C. Wheeler and Mr. DeVitt and William Cauldwell, editor of the *Sunday Mercury*. After the dry business had been dispatched supper was announced, and ample justice was done to the bountiful and recherche repast provided by Mr. Miller. After the covers had been removed and a brief introductory speech by the President, Abel Crook, the toasts were announced in the following order and drank standing amid a cloud of cigar smoke: 1. "Our Furnishing Committe: Honor to whom honor is due," which was replied to by Messrs. Wingert and Chamberlain. 2. "Our officers and trustees past and present: Always ready and never rash." Responses by ex-President White and Fiske. 3. "Our members: The backbone of the club. In unity there is strength." Messrs. De Fraine and Cleaver replied. 4. "Our visitors: Always welcome." The response by Vice-President Chappell. Interspersed were also songs by Messrs. Fisher, Cleaver, De Fraine and others. A quartette of Arion singers, composed of Messrs. Mook, Drew, Meyer and Crook, contributed largely to the enjoyment. The rooms are elegantly papered and painted, sides and ceiling, the windows are provided with appropriate cornices, lambrequins, lace curtains and shades bearing in gilt the club name. The chandelier is unique, and in the centre stands a bronze statuette of remarkable beauty. Brackets carved with dogs, deer, stags, eagles and game in relief rest upon the walls and support rare stuffed birds, while upon the mantel are three cases of birds set up by Mr. Akhurst, the veteran taxidermist, especially for the club, and which contain selected specimens of the principal game birds of America. Six of Pope's pictures, the Black Duck, Broadbill, Canvas back and Redhead, Woodcock, English Piper, Partridge and Quail, were hung upon the walls; of these, two were presented by Mr. Wright, framed by Mr. Crook, and the other four by Mr. Fiske.

TIN-COATED SHOT.—The shooting party who went West last summer in one of the Worcester Excursion Car Company's shooting cars, have demonstrated very satisfactorily that they know what an outfit should consist of. The car, "City of Worcester," is a marvel of comfort and convenience. The party used tin-coated shot, and this is what they say of it:—

"CITY OF WORCESTER,"
Homeward-bound, *Nov. 15th*, 1879.

LEROY SHOT AND LEAD MANUFACTURING CO., N. Y.

Dear Sirs: Returning from our shooting trip on the hunting car "City of Worcester," we take this time to say, we have used your tin-coated shot for about two months almost exclusively, and are very glad to say that it has given entire satisfaction. We think the tin coating a sure preventative against fouling or leading, and shall continue its use in preference to any other brand.

Jerome Marble, Worcester, Mass.
A. B. F. Kinney, Worcester Mass.
Ezra Burton, South Lancaster, Mass.
W. Henry Hutchinson, Lynn, Mass.
C. D. Kingman, Middleboro', Mass.
Gertrude C. Renwick, New York City.
W. C. Renwick, New York City.

MANITOBA—*Emerson, Jan. 17th.*—A friend and myself bagged on three successive trips of half a day's duration each—first trip, 56; second, 106, and third, 100 ducks, all mallards. This was done last October. We also brought to bag in one and a half hours in the last week of October 43 prairie chickens. Still you Americans say we have no shooting or shooters in Manitoba. E. G. S.

RARITAN SHOOTING CLUB.—*Keyport, Jan. 24th.*—In your issue of this week there is a mistake in the score of the Raritan Shooting Club in regard to the shooting of the tie between Waitt and Curtis. You had it that Curtis missed his twentieth and Waitt his nineteenth and twentieth in shooting off the tie; corrected, Curtis missed his eighteenth and Waitt his twentieth, leaving it still a tie, to be decided next monthly contest. S. P. D.

GUN PRESENTATION.—*Rutherford, N. J., Jan. 26th.*—We understand that two members of the Boiling Spring Gun and Fishing Club have presented their fellow member, Mr. J. H. Vreeland, with a beautiful hammerless gun, of superior finish and magnificent design, as a token of their appreciation of him as a marksman whose merit should be acknowledged. The presentation was undoubtedly called out by the flattering notice given by the FOREST AND STREAM of Jan. 8th of a match in which he engaged. We wish Mr. V. that success which he has attained in the past may be his constant companion in the uncertain future. RUTHERFORDS.

NORTH CAROLINA—Further advices from Mr. E. A. Malley, of New Haven, who is spending the winter at High Point, N. C., report that quail are so abundant within sight of the town that a fair shot may bring in a good bag any day. The country is charming and the climate most agreeable and pleasant. Visiting sportsmen will find excellent accommodations at the Bellevue House, Mr. E. E. Post manager. Quite a number of sportsmen from the North are now there.

GEORGIA—*Americus, Jan. 25th.*—During last fall and this winter I have hunted and shot quail a great deal, and over considerable territory, and I had hoped to find some of the migratory quail; but not one of them has been found by any of us. I am satisfied there are none in this or adjoining counties, or some one of our club would have found them. The winter has been remarkably mild, and consequently ducks have been scarce. But we have the prince of game birds with us in abundance. I wish some of your Northern sportsmen could be induced to spend a winter in this locality. Come with their dogs and their guns, and stay all winter; live with us, and rough it with us, and, above all, shoot birds with us in the piney woods. SHOT.

FLORIDA—*Kissimme River and Lake Ocheechobee.*—Col. Allen has finished the steamer *Mary Bell*. She is fifty feet long and twelve feet beam; speed eight miles per hour. He has cleared out the head of the river and opened navigation from Lake Tahoptaliga to Lake Ocheechobee. From Lake T. to Lake O. the distance is about three hundred and seventy-five miles; time, five days. The Colonel proposes to make monthly trips, leaving the upper lake about the 4th or 5th of each month. But if desired by sportsmen or tourists he will make an extra trip monthly. The Colonel has arranged with Captain Hemmingway, of the steamer *Arrow*, for through tickets, and will meet passengers with teams at the end of the *Arrow's* route—the Upper St. John.

The Colonel informs me that he has arranged for the building of boats 18 feet long, 5 feet beam, and 16 inches deep, for $22. The Captain has opened up one of the finest sporting regions of the State, more especially for deer. Lake Istokpoga is twelve miles long and nine miles wide. In a direct line it is nine miles west of the Kissimme and eighteen miles north of Lake Ochechobee. The lake is full of fish, and the surrounding country is elevated and rolling. For deer and bear this section cannot be excelled. Thus far sportsmen have not visited the section about Istokpoga, and it presents a fine field for sport and adventure. To reach the lake a party could leave the steamer at Istokpoga Creek, and by small boat ascend it to the lake, distance by the creek probably twenty miles. Colonel Allen's post-office is Osceola, Florida.

AL FRESCO.

CRESCENT CITY GUN CLUB.—The Crescent City Gun Club, which was quite prominent among sporting organizations in New Orleans last summer, reorganized a few days ago, and elected the following named gentlemen to

the offices designated : A. Deroux, President ; F. Quevene, Vice-President ; J. Philpot, Secretary ; C. J. Day, Treasurer ; A. Cardona, Jr., Captain. The club proposes to keep the interest of its members excited by having periodical matches for handsome prizes.

OHIO—*Cincinnati, Jan. 9th.*—The following is the score of a shooting match made on the above date by four members of the C. S. and F. Club, Messrs. Koch and Whetstone shooting against Messrs. Caldwell and Disney. The birds were picked for the occasion, and were a rare lot. During the match the wind blew a gale :—

	Yards.

Total																C.

INDIANA—*Cloverdale, Jan. 19th.*—To the citizens of this quiet little burg and surrounding country, January 17th was a gala day, the occasion of which was a grand fox drive. The area enclosed was four miles square. At 10 A. M. the lines were formed, and the hunters advanced with the firing of cannon. They continued to advance until one-fourth mile apart, when dogs were turned loose. One poor reynard was soon brought to grief, the the rest (four or five) made good their escape by breaking through a weak place in the lines.

Our season for quail shooting closed January 1st. The number killed was far below the average, owing to the drouth in the early part of the season, and the continued rains in the latter part of it. If nothing happens then we will have a bountiful supply next year. Rabbits are very plenty, and may be had for the walking, as every brushheap and briar-patch reveals one. B. B.

POINT MONICA SHOOTING CLUB.—The officers of the club for the coming year are : President, W. C. Colburn, Detroit ; Vice-President, W. C. Dennis, Grand Rapids ; Secretary and Treasurer, E. H. Gilman, Detroit ; Directors, W. C. Colburn, W. C. Dennis, E. H. Gilman, E. C. Nichols and T. W. Edwards.

TEXAS—*Cleburne, Jan. 20th.*—As a lover of legitimate sports, I wish to report the organization on Jan. 20th of the Cleburne Gun Club with, twenty-one members :—A. J. Cowley, President ; Charlie Gunn, Vice-President ; W. W. Styron, Secretary. F. P. Pendery, Treasurer. We are advocates of protective game laws and their strict enforcement. IZAAK.

THE AUXILIARY RIFLE BARREL.—*Philadelphia, Penn., Dec. 26th, 1879.—Editor Forest and Stream.*—Having just returned from my annual trip to North Carolina, Virginia and West Virginia, wild turkey, duck and bird shooting, and where I found plenty of all kinds of game, I wish to compliment the manufacturers of the Shelton auxiliary rifle to breech-loading shot gun. It certainly is the most complete arrangement in the world, and no sportsman has a complete outfit without the auxiliary. I speak from personal experience, and not from hearsay. It is safe, very accurate, and shoots with great power. I killed five wild turkeys in succession, besides many ducks and geese, at long distances ; for deer and heavy game it must be invaluable. Sportsmen who are unacquainted with the arm I advise to try it. I would not take $100 for mine if I could not get another. Although I am an entire stranger to the manufacturers I take pleasure in highly praising them in their efforts to place before the sportsmen such a device, and must say it merits all that they claim. S. J. STEWART,

BUCK SHOT IN CHOKE BORES.—*Macon, Mo., Jan. 18th.*—As I never see anything from this part of the country in your valuable paper, I have concluded to try my fist. The FOREST AND STREAM is handed to me every Saturday by our newsdealer, and is always acceptable. I quit smoking and drinking in order to be able to take your paper, and am well satisfied that the change has done me good. I take a great interest in sporting matters, and am always ready to discuss anything pertaining to shooting, and feel satisfied that through discussion we learn a great deal. I have just read with some interest the article of "R. T." in last issue about loading choke bore with buckshot, and feel like giving my experience. Three and a half drachms of powder is not enough for a load of buckshot ; four and a quarter drachms for a 12-bore, and five drachms for a 10-bore is the proper load of powder. My method of loading a choke bore with buckshot is this : Put in five drachms of Orange ducking powder No. 4, with two pink-edge wads lightly on powder, then put in a chamber of shot that chambers nicely at muzzle, then put on a Baldwin wad, then another chamber of shot, and another Baldwin wad, and another chamber of shot, with a cardboard wad on top, turn down shell nicely, and you have a load that will stop an old buck at seventy-five yards. The above is the way I load for a No. 10 ten-pound gun, full choke, by W. & C. Scott & Sons, of Birmingham. It is not material whether the shot chamber with one in center or just in a ring around inside of shell. Let us hear from others, BORDER RUFFIAN.

NEW YORK—*Gansevoort, Jan. 19th.*—I notice communication of "R. T." in last issue on chambering buckshot. As the subject seems to be of general interest, I am led to give the plans I have adopted, which are the result of quite exhaustive experiments.

I have found that different guns require different treatment, one system giving best results in one, and another in another, and it is always advisable to humor the idiosyncracies of each to a certain extent. I have tried the plan recommended by "R. T.," and have found it far superior to the common method of tumbling the shot into the shell promiscuously. The principal objection to it is the impossibility of using a pellet of sufficient size for big game, that is, unless one happens to be using a gun with a mouth like a stump orator. With choke bores, when the shot is chambered in the shell the gun is more liable to lead, I think, and I also think when the shot is chambered tight back of the choke they have a tendency to strain the gun at the muzzle, notwithstanding the fact of the unoccupied space in the centre.

I have secured most satisfactory results by using a size of shot three of which chambered at muzzle, charging with three layers, or nine shot. I regard this size as best adapted to the "speedy taking off" of deer, bear, or other large game. A card-board wad between each layer will produce more uniform results. I used this charge in Michigan last season in a 12-bore Fox, killing a buck at seventy-three paces, and an old doe at eighty-six paces, knocking both down dead in their tracks. It would seem as if such work should satisfy the most exacting. But when extreme closeness of pattern is desired, it is best to adopt the following plan : Select the size of shot to be used, which should chamber snugly at muzzle ; then take a wad (black edge will do), and punch as many holes in it as there are shot in each layer, in such position that when the shot are in position in the muzzle, and the wad placed on top, the centre of each shot will be directly under the centre of the corresponding hole. Punch a lot of these wads, using the first as a pattern. If the larger sizes of shot are used, a punch making a hole one-quarter inch in diameter should be used. Now charge your shells, putting on powder first, a pink edge, then a punched wad. Drop in a layer of shot, being careful to have them take their proper positions in the holes. Place another punched wad on top, holes squarely over shot, and so on, using any tight-fitting wad that will hold the shot firmly in position on last layer. You now have a load every shot of which will go with the precision of a tight-fitting bullet from a smooth bore. All that is necessary, in order to secure the best work of which the shot gun is capable, is care in preparing the cartridges. JOS. W. SHURTER.

SHOOTING MATCHES.

LONG ISLAND—*Brooklyn Driving Park, Jan. 21st.*—Seventh average handicap contest of the Fountain Gun Club. The conditions were as follows : The member making the best average score in twelve contests (one year) to be the winner of a Parker gun ; a silver pitcher and a silver goblet to the second and third best average scores respectively ; 7 birds each ; each to shoot 3 birds at 21 yards rise, 2 birds at 26 yards, and 2 birds at 30 yards ; 80 yards boundary ; from two plunge traps ; 1¼ ounces of shot ; the use of one barrel of the gun allowed :—

LONG ISLAND SHOOTING CLUB.—The annual meeting of the Long Island Shooting Club was held last week, with a large attendance of members. The Secretary's report showed sixty-eight active and eleven honorary members on the roll. Twenty-three shooting contests had been held during the year—twelve for a gun presented by the President, Mr. A. Eddy, which was finally won by Mr. W. Wynn, who won it three times out of twelve. There were eleven championship cup contests, the cup remaining the property of the club, the winner in each contest receiving $25 from the club. In the twenty-three contests 2,629 birds were shot at and 1,928 killed—an average of 73.37. The officers elected were : President, Mr. W. Wynn ; Vice-President, Mr. G. F. Gildersleeve ; Treasurer, Mr. R. Robinson ; Secretary, Mr. John Henry ; Executive Board, Messrs. J. Ackhurst, J. D. W. Turner and R. Midmer. A sufficient sum was appropriated for the purchase of a handsome gun for competition during the ensuing year, and a committee was appointed to meet and coöperate with committees from other clubs on Long Island, with a view of securing a meeting of the New York State Association for 1881 in Kings County.

NEW JERSEY—*Erbe's Shooting Grounds, near Newark, Jan. 21st.*—Pigeon match of $100 ; 25 birds each ; 30 yards rise ; 80 yards boundary ; trap and handle ; Long Island rules :

Francis..	1	0	1	1	0	0	0	0	1	0	0	1	1	0	1	1	0	0	1	1	1	0	0	1	1	0	—11							15
Hughes..	0	1	0	1	0	1	1	0	1	0	1	0	0	1	1	0	0	1	1	0	1	1	0	0	0	0	—00							13

JERSEY CITY HEIGHTS VS. ESSEX GUN CLUB.—An invitation having been extended by the Essex Gun Club of Newark to the Jersey City Heights Gun Club, for a friendly match at the traps, it was promptly accepted ; the same to take place as follows : ten men each club, at 10 birds each, Essex Club rules (which we understand allow the use of both barrels, but the bird must be on the wing each shot) ; the match to come off at Essex Club Grounds, Erb's Hotel, Newark, N. J., Feb. 22d, P.M. As the best shots have been selected from each club, and both clubs have good reputations, a close time is expected.

Port Morris, Jan. 24th.—Glass-ball match on the Knickerbocker Yacht Club Grounds for the Gun Club Medal ; 15 balls ; rotary trap ; 80 yards. The scores were very poor, owing to the hardness of the balls used, many of which had a half-dozen dent marks on them, and still were not broken. The following is the score :—T. N. Jacques, 7 ; W. Potter, jr., 7 ; F. Chedsay, 7 ; A. A. French, 4 ; A. E. Miller, 3. In shooting off the tie at five balls Jacques broke 4 ; Potter, 3, and Chedsay, 2. The medal will be held by Mr. Jacques until the next shoot on Feb. 23d.

PENNSYLVANIA—*Collamer, Chester County, Jan. 19th.*—The Collamer Rod and Gun Club held a glass-ball shoot on Saturday the 17th inst., in which the members and a few invited guests, among whom were Messrs. Pownall, McNiss, and A. P. Broomell, of Christiana, Lancaster Co., Pa., participated. The conditions of the shoot were 24 yards rise, 15 balls, 1¼ ounce shot ; balls to be broken in air. Bogardus' rules only tended to confirm the superiority of choke-bores over cylinders. The balls were invariably broken from 45 to 65 yards from the shooter. Although very few cylinders were in the shoot, they could not cope with the choke-bores which were used by Messrs. Pownall, McNiss, and Houston, their guns breaking balls with No. 8 chilled shot 75 yards distant. Messrs. Pownall and Houston tied on thirteen balls—then they each broke ten balls straight, deferring the shoot-off. Team of four each were then selected, consisting of Pownall, McNiss, Broomell, and Miller, of Christiana ; and Houston, Durnall, Gill, and White, of Collamer ; each man five balls. Houston's Collamer team beat Pownall's Christiana team by two balls in first shoot. Another trial, same teams and rules, Pownall's team beat Houston's three balls, nearly all of the shooters making full scores at 15 yards rise.

HOWELL SHOOTING CLUB.—*Howell, Mich., Jan. 17th.*—The Howell Shooting Club inaugurated the new year with a day's sport at the traps Jan. 16th. The weather was all that could be desired, the sky was slightly shaded with light clouds, and a mild, soft breeze blew across the traps. The birds were declared by all present the strongest ever offered to the boys. The shooting began at 10 A. M. from plunge traps, 80 yards boundary. Detroit Gun Club rules ; handicap rise. First match for a number of prizes offered by the club ; not class shooting ; 6 single birds :—

Tanner.....	0	0	0	0	0	0	w																											
Cook.....	1	1	1	0	0	1	1	1	1	0	0—8																							

Shoot off ; 5 balls each ; 21 yards :—

Jewett.....	1	1	1	1	1—5	Wilber.....	1	1	1 1 1—5
Beach.....	1	0	w			Angel.....	1	0	w
Hoagland.....	1	1	1	1	0—4	E. Fisher.....	1	1	1 1 1—5
Rumsey.....	1	1	1	1	1—5	J. Fisher.....	1	1	0 1 0—3

Second tie ; 5 balls ; 21 yards :—

Jewett.....	1	1	1	1	1—5	Wilber...	1	0	1 1 w
Rumsey.....	0	1	1	1	w	E. Fisher.....	1	1	1 1 0—4

This gives the badge to Jewett three times in succession, but under the rule governing he must defend it one year against any member in the club who shall challenge for it. Following this, sides were chosen for the supper (which had been ordered at the Rubert House,) five balls each, closing the greatest day's sport ever spent by the club. GREGORY.

Archery.

THE QUESTION OF BOWS.

ARCHERY is in its experimental stage. Of ten men and women who draw the bow nine are tyros, and of these nine, eight will argue pro and con about a certain make of bow. The same inventive genius, mechanical skill and crucial testing which have been employed in the manufacture and use of American firearms are now brought into play in American archery goods.

The magnitude of the movement among our manufacturers of sportsmen's goods to meet the sudden demand for bows which followed the enthusiasm invited by Mr. Thompson's writings, has been little appreciated even by those who have watched it with the keenest interest. Given the required qualities of a perfect bow, our different manufacturers have promptly set themselves at work to solve the problem of supplying the article.

Two American-made bows are already in the field. The goods of English makers have also found a large market here, and archers are found who uphold the foreign goods against the domestic.

As the question of bows is one which is in the experimental stage of archery full of interest, we have allowed the fullest expression of opinion from such practical archers as we have thought capable of expressing an opinion worthy of consideration. Our object has been not to allow the goods of one maker to be unduly puffed by interested parties, nor the goods of another unjustly disparaged. As a rule the authors of the letters, which have appeared from time to time in these columns, have been known to us as archers who were best fitted to discuss the various topics. The name of every correspondent whose letter appears over a *nom de plume* or initial is known to ourselves, and carries with it the assurance that the writer is honest in his convictions. This may be, we trust, a sufficient answer to a Chicago reader, who writes :—

Allow me to enter my protest against the too frequent free advertising which some of your correspondents indulge in. I refer more particularly to the communication of "N. K. D." in yours of January 8th and a reply thereto by "W. H." in your paper of January 15th.

Why is "N. K. D." so persistent? * * * We notice he never gives any of his own scores. Why is this? Is he not an archer? He always gives us Dr. Weston's scores and a good deal of information about him, and well he may, for this is just what the younger archers wish to know—what the finer archers are scoring and how they shoot.

There is a bit of fun just here which we might enjoy at the writer's expense had not "N. K. D." anticipated us by coming forth from his Castle Incog. to fight his battles in his own person.

The following letter we publish because it is due to Dr. Weston that he should have an opportunity of substantiating former statements which have been called into

doubt. We must, however, distinctly state here once for all that we cannot approve of further personal controversy. The columns of the FOREST AND STREAM are always open for the discussion of any question bearing upon the advancement of any sport. When the argument becomes at all of a personal nature correspondents may not expect to see our space occupied with its publication:—

HIGHLAND PARK, Ill., *Jan. 22d.*

Editor Forest and Stream:—

My communication, signed "N. K. D." and published in your issue of the 8th inst., called out such an "answer" from Mr. W. Holberton that I think it proper to make a brief reply—it may not be an answer.

In all my archery notes which have appeared in the FOREST AND STREAM I have endeavored to give opinions as opinions and facts as facts, and to make no statements about matters I was not posted on. So when Mr. Holberton politely tells me I am not posted, and willfuly or ignorantly misconstrues what I write, I feel called upon to take a little notice of him. He says he has handled very many of Mr. Aldred's bows, knows they do not stand this climate, and that the universal complaint is that they break very easily. The complaint can hardly be "universal," though it may be as far as his knowledge extends. And though numbers of the Buffalo club may bear him out in his statement, I am informed that nearly all of their best archers use Aldred's bows.

In reply to the statement of the fact that "for $30 we can get as fine and durable a Spanish yew as one would wish," Mr. Holberton says: "As to Spanish yews costing only $30 landed here, I doubt." His "doubt," while it impeaches my honesty, does not alter the facts in the case. The Spanish yew in question, now owned by Mr. O. W. Kyle, was imported by Mr. H. C. Carver and sold to Mr. Ford P. Hall for $18.74.

Mr. Holberton seems very anxious to compare this bow with Mr. Beecher's split-bamboo. Mr. Kyle assures me his bow has shot more than 8,000 arrows, and I venture the assertion that should Mr. Beecher's bow be at the next grand National Meeting it can be compared with Mr. Kyle's, both as to condition, power and ability to drive the arrows to the centre of the target.

Mr. Holberton says, Spanish yews "cannot be sold in London for less than $30 or $40." If he will refer to Mr. Aldred's price list, of which he probably has a quantity, he will learn the price of bows in London. Again, Mr. Holberton writes: "As to American makers overcharging, I am afraid 'N. K. D.' is not posted. He can buy a good bow of American make for $2.50 to $4.50." Mr. Holberton entirely misrepresents me. I referred in no way to American makers' charges for American-made goods. You will see by looking at the article in question, that I said "American dealers in English archery" overcharged. From which statement it would hardly seem possible to infer that I meant overcharged for *American* goods.

In praising Mr. Aldred's goods, I have not done so because I was interested in the sale of archery, but because as an archer they have pleased me so well. And, by-the-way, Mr. Aldred has not realized large profits from his American trade, as one dealer—he it said to our shame—still owes him nearly two hundred pounds for archery goods which he finds it impossible to collect.

Considerable stress is placed upon the fact that some American makers warrant their bows. This would be very nice for all parties, if it only prevented their breaking, or was proof they would not break. But if they break in other places as fast as they have here, we fear the makers will not long continue to warrant them. Early last season Mr. Carver had a split-bamboo made to order. Only a few arrows had been shot with it, when I saw a foot of the upper limb break off while it was being shot. It being warranted, another was sent to take its place. But it broke like the first. A third was sent, which has not yet been tried, for when it was to be tested the tips came off and it was put aside. As far as we know, only one other split-bamboo bow has been owned here. Mr. Gray won the one offered for the best fifty yards shooting at the Chicago meeting. But it was so missshaped that he did not dare to use it, and the makers are to give him another in its place. The makers have kept their warrants good in a most praisworthy manner.

EDWARD B. WESTON.

TENDENCY OF AMERICAN SKILL WITH THE LONG BOW.

THE year 1879 having passed into history fraught with many notable events, I would like to call the attention of the archery world, all of whom read the FOREST AND STREAM (or should do so if they now do not), to a few of the distinctively progressive achievements which American toxophilites in their first season of experience have contributed to the old year's records, and I am very sure that every "archer born" will appreciate and ever take pride in the very creditable scores that are chronicled upon the pages of the year just gone. This review will be drawn up chiefly, and perhaps in some cases imperfectly, from the author's memory, and with the view and desire of eliciting through the columns of FOREST AND STREAM from brother archers everywhere, an enlivening interchange of comment, correction and criticism.

I would first invite the reader's attention to a few of the exceedingly great difficulties—the impossibilities of impossibilities—that exist in archery, and wherein lie its fascinations, as every toxophilite knows. In evidence of this fact it may truthfully be noted that even at the short ranges of thirty, forty and fifty yards, with twenty-four arrows and upwards, no perfect score has ever yet been made; no archer has ever yet succeeded in training his nerve forces to that steely, machine-like steadiness requisite to command of a nine-inch circumference through twenty-four successive shots, even at thirty yards. The English gentlemen archers (generally conceded to be the best the world has ever produced) have very uniformly confined their practice to distances of sixty to one hundred yards; the Royal Toxophilite Society, of London, however, setting apart one day in each season for a prize contest with one hundred and forty-four arrows at one hundred and twenty yards. The Woodmen of Arden also are an exception to the rule, their awards being based upon superior skill at nine score (one hundred and eighty) yards, shooting at clouts. That it seems most simple and easy to the ignorant spectator to hit a great four foot target at thirty yards is a matter of quite common experience, in fact wherever there are archers and spectators. Yet place a bow and arrow in that same confident critic's hand for the first time and note the physical contortions, the painful writhing of face, arms and limbs, and the final release of the arrow, which finds its way into the limb of a tree or is snaked in the turf five or ten yards in front of the shooter. The astonishment of our critic at the result of his unerring marksmanship is unfeignedly marked, and he insists that it must have been a mistake (his friends endorsing this expression of good judgment). He tries another shaft, which is obstinate enough upon being loosed to fall at his feet, and he retires with sore fingers and chagrined vanity to a study of the mutability of human assurances; and that man never fails of being present at succeeding archery gatherings; the charms of this illusive, unconquerable pastime have stirred his ambition, and he becomes its votary.

The essential difficulties that obtain in overcoming the obstacles to success in archery may best be condensed in the assertion of Horace A. Ford, of England (who was the most finished and accurate acher the world has ever seen), that in the two to four seconds intervening between elevating the bow and the release of the arrow the mind, or will, should command into action over twenty-four different concentric conceptions. What an array of impediments; and what wonder, then, that those gentlemen who have for many years excelled as rifle and wing shots should marvel at their inability to hit a target at sixty yards. I can now call to mind two gentlemen, both of whom are acknowldged superior rifle shots, yet are altogether deficient as archers. They have bestowed many days and hours in a brown study over the complexities that invest the successful archers' kingdom, and they are now apparently no nearer a solution of those complexities than when their first shaft ruthlessly disobeyed their will and furrowed the green turf.

During the months of October and November last a few English archers tried the experiment of shooting the American Round, adopted by the National Archery Association of the United States, the leading scores having been made as follows:—

	Hits.	*Score.*
Mr. O. L. Clare	79	479
Mr. G. L. Chapman	78	482

These, I believe, were the only two scores exceeding 400, Messrs. Chapman and Clare both ranking high as short-distance shots, and they have also won distinction for noticeably good scores at the York Round. At the fifty yards range of the American Round Mr. Chapman made 184 with his thirty arrows, which is most excellent shooting. While the above scores fall short of some of the high scores made by our own best archers, it should yet be remembered that the Englishmen were trying an experiment at ranges that were strange to them, and not adapted to their style of shooting. I do not make this reference and comparison to draw attention to the respective merits of British and American skilled archers, for in this very beautiful pastime our own countrymen are at the present time but novitiates, apt pupils of the sturdy Briton; yet they have advanced most encouragingly in the acquisition of long-bow tactics and science, and the day is not far distant when we shall boldly invite our brothers from over the ocean to join issue with us in a contest for international supremacy.

Mr. Horace A. Ford, of England, was undoubtedly the most perfect of archers that ever lived in all the centuries before, or the decade since his day. Both in style and accuracy he was superior to all other shots, as witness some of his scores (practice):—

	Hits.	*Score.*
75 arrows at 6 yards	75	555
28 golds, 37 reds, 7 blues and 3 blacks.		
24 arrows at 60 yards	24	188

At the York Round (consisting of 72 arrows at 100 yards, 48 at 80 yards and 24 at 60 yards) he scored:—

100 *Yards.*		80 *Yards.*		60 *Yards.*		*Total.*	
Hits.	*Score.*	*Hits.*	*Score.*	*Hits.*	*Score.*	*Hits.*	*Score.*
71	315	48	290	24	160	143	765

missing only his fifty-ninth arrow at the hundred-yard range. Again he scored on the Single York Round 137 hits, 809 score. He won the English champion medal eleven successive years, with such scores as 1,074, 1,251 and 1,076 on the Double York Round, getting from 214 to 245 hits out of the 288 arrows shot, and usually making all of the ten points, by a majority of which the emblem is won. At the Leamington and Midland Counties meetings he was successful eleven years out of fourteen, getting into four figures no less than six times, viz., 1,014 1,026, 1,030, 1,087, 1,128 and 1,162, with hits ranging from 212 to 244. The only other archer who has succeeded in passing the boundary line of three figures in public shooting is Major C. H. Fisher, who made at the Grand Western Meeting in 1870, 225 hits, 1,033 score; again in 1872 at the same meeting 218 hits, 1,060 score, although in private practice he has several times exceeded 600 on the Single Round. The majority of the first-class archers of England to-day seldom reach 900 on the Double York Round in public. This is considered among Britons a high score, and so it is, as let any one try who doubts.

Mr. Will H. Thompson, of Crawfordsville, who since the national meeting in August last has been shooting with great steadiness and reliability, is undoubtedly far in advance of all other American archers. Some of his best scores are as follows:—

Hits.	*Score.*		*Hits.*	*Score.*
30 arrows at 100 yards. 30	196	30 arrows at 80 yards. 30		166
24 arrows at 60 yards. 24	160	73 arrows at 100 yards 54		220
48 arrows at 80 yards. 44	200			

Single York Round, 108 hits, 530 score; Double York Round, 213 hits, 1,029 score. Mr. Thompson may confidently flatter himself that but few archers living can make a better exhibit of fine shooting than the above scores, which he will pardon me for having taken the liberty of having published. Mr. Maurice Thompson has also since midsummer last made rapid progress, and promises soon to make his younger brother exceed those already great scores (noted above) if he would retain his distinguished title of champion. Mr. Thompson has beaten 400 at the Single and 775 at the Double York Round; has hit with eighteen arrows out of twenty-four shot at eighty yards, getting a score of 96.

Messrs. Boge, McMechan and Brewer, of the Wabash Merry Bowmen, have also shown themselves capable of contributing excellent scores (when occasion may require) towards retaining the archery renown which attaches to the name of Crawfordsville.

The Toxophilites of Buffalo are destined to take high rank as skilled archers. The almost faultless form adopted by Messrs. Spalding and Sidway of this society being specially noticeable, and giving promise of high scores to their credit during the coming season, in fact, I would venture the hint, that before the National Medal has passed permanently into the hands of any one individual, it will have adorned the person and honor of a "Buffalo Toxophilite."

Mr. L. L. Peddinghaus, of Marietta, with a single York Round of 95 hits, 421 score; Mr. Ford P. Hall, with 84 hits, 380 score; Dr. E. B. Weston, with 126 hits from 144 arrows, at 60 yds., 632 score: Mr. Gray, 29 hits from 30 arrows at 60 yds. and 165 score, and Mr. O. W. Kyle, 28 hits, 164 score, with same number of arrows and distance, are deserving of special mention as having made rapid advancement in skill at the long distances. Mr. Manly, of Toledo, Mr. Gray, of Cincinnati, Mr. Brownell, of Boston, Messrs. Hussey, Finkbine, Fullerton, Henry and Hackney, of Des Moines, Messrs. Proctor and Phipps, of De Pere, Mr. Patterson, of Lawrence, Kansas, Mr. Church, of Charlotte, Mich., Messrs. Egan, Fairfield and Smith, of Chicago, have all made high scores and shown great improvement both in form and accuracy. Mr. Haven, of San Francisco, also shoots strong and reliably, and Eastern archers will do well to look out for him, as he is a formidable competitor. Our American lady archers have made even greater progress than have the gentlemen, and one of the brightest assurances of the future high rank which archery shall take in this country as a refined and high-toned pastime, is the steady and persevering interest which the ladies take in it. Mrs. Townsend Davis and Mrs. Sidway, of Buffalo, Mrs. Lee, Mrs. Klein and Mrs. Ramsay, of Crawfordsville, Mrs. Carver and Miss Street, of Highland Park, Mrs. Brown, of Hastings, and Miss Bixby, of De Pere, have all made creditable scores during the past year, many of their practice scores exceeding 700 at the Double Columbia Round.

In concluding this brief review, I feel that we may all take great pride in both the private and public performances of the year, and in the extended growth of so pure and healthful a recreation as archery, and I would earnestly recommend all organized societies to unite themselves with the National Association, and thus aid in strengthening and intensifying the already well developed interest in the pastime. I would further ask that during the coming archery season every society send reports of its weekly or fortnightly meetings to the FOREST AND STREAM, which is the accredited American archer's organ. The archery editor of this excellent paper has expressed himself as desirous of getting items from all quarters, and I trust that the generous space allotted to archery each week in its columns may be filled to overflowing. Thus may cold wintry evenings be pleasantly passed in resurrecting and reviewing a carefully preserved file of archery scores and incidents.

HENRY C. CARVER.

MORE EXPERIENCE.—*Marietta, Ohio, Dec. 21st, 1879.*—*Editor Forest and Stream:*—Thinking the experience in archery tackle of our club might be of interest to others I send this paper. In the last year the Arden archers have tried nearly every style of bow from the cheapest American lance to the finest Aldred Spanish yew. In the English goods those by Aldred have given the best satisfaction. We have in use five self-lance and one Spanish yew. The yew drawing forty-nine pounds has been in constant use for nearly two years, and is now as perfect as ever. We have broken three lance, one of them as perfect a piece of timber as I ever saw. It soon filled with frets and went to pieces. The English lemon have not given satisfaction, we having broken seven this season, all of them by Highfield. We have three lance by the same maker that have stood the very hardest usage, and are now as good as ever. We have three bows by Feltham, which have stood well, but they are nearly round, and our archers object to them on that plea. With Horsman's goods we have been the best pleased; some of the first he sent out were made nearly round, something after the Feltham pattern. These did not give satisfaction, but all of the late bows have been exactly right. We have given his self-lemon, beef-backed and lance-backed the hardest usage, and we have never had one give out. The beefwood backed with lance, though inclined to follow the string, are the nearest to the yew of any bows we have used. His lance backed with hickory are also first-class. The arrow we incline towards is Aldred's; they are feathered with peacock feathers and are more durable.

Horsman's arrows are excellent; we have used more by him than any other maker. But when he makes the pile to fit the stele perfectly, so they will not bend when ever they strike anything hard, and puts his feathers on without cutting creases in the stele, then they will be the *par excellence* of arrows. L. L. PEDDINGHAUS.

Women's Column.

WOMAN IN THE FIELD.

IT has been urged as a reflection upon the sex that a woman cannot throw a stone. Granted; and doubtless God did not intend women to throw stones. But we have seen fair marksmen who were as expert as their masculine companions with rifle and shot gun, and we have been in the camp where wives, sisters and daughters were most admirable acquisitions to the *personnel*. In fact, a woman can accommodate herself to the exigencies of camp life much more readily than a man will; and we actually believe that if she be relieved of the flummeries of fashion and the trammels of outrageous dress, she can endure more roughing it in the woods with less fatigue and less flagging of enthusiasm than her husband or brother can. They have a sensible summer fashion up among the Catskills of donning stout shoes and strong walking dresses without any "fixings," and tramping off up the mountains and down the ravines, through woods and thickets, and over logs and rocks.

It is not always the thing for a man to take his family into the woods with him. It is the very freedom from

them in common with all other concerns of every day life that give the wonderful results of a vacation jaunt. Ten to one when he gets home and sees them all again he will love them better than ever. Possibly a selfish motive may enter here. Why should it not? The week or a fortnight of a whole year which a man may call his own he wants to himself. Whether the wife shall go into the woods with the husband is something for the husband to decide.

But many men leave their wives at home because they do not appreciate how much added charm the feminine presence adds to woodland life. We know scores of such men who think they attain all possible satisfaction from the vacation sporting trip, and who might yet find a new satisfaction did they take their wives and sisters and mothers and daughters along to share the transient lapse into savagery.

How far is it practicable for women to go shooting and fishing and exploring? We leave it for those to answer who have practically solved the question. Here are two letters, coming from widely different latitudes, representing one the far distant Northwest, and the other the sunny South :—

NEW WESTMINSTER, British Columbia, *Dec. 20th*, 1879.

Permit me to congratulate you for enlisting sportsmen's wives in your large staff of contributors. Your paper is a very welcome one to our household, and my husband thoroughly enjoys and appreciates it. Many of the articles in it he reads to me, and many pleasant evenings are spent in discussing various topics, a knowledge of which is only gained through your columns. Sometimes, I admit, such as the recoil theory, the upset of bullets, the powders, etc., get to be montonous, but my husband takes such a lively interest in them that I suppose it is all right.

Sometimes I go with him on his hunting trips, and on one occasion killed a fine deer to my own gun. I often get tired of dogs, guns, torn and soiled clothes, and the various other inconveniences occasioned by being married to a man who is nearly a lunatic on hunting, but I console myself with the thought it might be worse; and the venison, grouse, ducks, geese, snipe, beaver's tails, etc., so often to be found on our table have a wonderfully soothing effect. We have only one child, a little girl, who bids fair to follow in her father's footsteps—her principal talk being about shooting bears, deer and other wild animals, and if my husband carries out a tithe of his projects concerning her, I expect her to turn out a second edition of Mayne Reid's "Wild Huntress."

I am a candidate for the "big fish-hook," provided it is not already awarded. The enclosed slip, which has been in my scrap-book for the past four or five years, was contributed by my husband (who sometimes addresses you under the *nom de plume* of "Mowitch") to our local paper :—

A gentleman, while on a hunting trip in one of our rural districts, sat one evening on the bank of a small stream, surveying the beauties of nature, when his attention was attracted by a trout jumping from the water and catching one of the numerous flies hovering about. Just as the trout secured his prey a mink, lying in wait on a projecting log, sprang out, caught the trout, and took him to the shore, and commenced making a meal. While thus engaged a lynx glided on to his back from a neighboring tree, killed and proceeded to devour him. At this moment a wolf emerged from the forest, and seeing the lynx, made for him and killed him on the spot. The noise made by this pair attracted the attention of a large cinnamon bear in quest of his supper. Bruin without delay attacked the wolf, who gave him battle, but was soon vanquished by a hug from the bear's powerful arms. At this juncture the sportsman, thinking it was time for him to take a hand, raised his rifle, took deliberate aim, and shot the bear through the heart, laying him dead in an instant. He then secured the various animals, returned to his home, and is now patiently waiting for something to come along and kill him.

Tendering you the compliments of the season, and wishing unlimited success to your paper, permit me to subscribe myself as your friend, COPETKA.

SARASOTA, Fla., *Jan. 10th*, 1880.

I have been very much interested in what our sisters have had to say, and the spirit moveth me and I must speak. I want to thank "Rebecca" for saying so beautifully what I would like to have said. She is a woman after my own heart. I also am next to her in age, for doesn't my big daughter look down upon me? I want to say a word to the stay-at-home wives (the gentlemen will please to pass on to the next page and become absorbed in that thrilling "bar" hunt). You are a young housekeeper, and have just opened upon one of Aunt Chloe's "clearing up" days, and John comes rushing in, with face beaming, and says: "Jane, I have a day out; don't know when I shall get one again. Let us go to the woods." Now don't throw up hands and open eyes, in pious horror, and say, "Mrs. Smith will tell what a slack housekeeper I am," but discreetly close doors and shutters, and put on your hat and go. Gather all God's blessed sunshine that you can. Fill your basket with the beautiful ferns and mosses, and I opine in the evening that John, instead of slipping around the corner for a while, will be happy to sit down with you and help you arrange your woodland treasures; and there will be such a happy light in your eye that it is more than possible he will tell you "how pretty you are growing." As the years slip on and the cares increase, if he is the kind of husband I believe him to be, the long hunting trips will be more occasional unless you can accompany him. The pleasant afternoon ride or the sail down the river will be substituted for your comfort. We have our little corner; our editor says we may say our say, and we may hold sweet converse together even if our words are not always full of wisdom.

SUSAN.

HOME-MADE DECORATION.—"Rebecca" thinks there is no use in decorating our homes when the male portion of the family do not appreciate our efforts; still our conscience will be at rest if we do our duty, so I will give an original idea.

Those lady readers of your valuable paper who have husbands, brothers, or sons, who smoke cigars and buy them by the box, just quietly empty the contents into a pasteboard box and appropriate the wooden one. Remove all the superfluous paper from it; rub it smoothly down with sand paper, make a hinge of strong tape, glued on, if the one that is already on is weak; then procure some shellac varnish if you want the box light; if dark, mix a little lamp black with the varnish and give it two or three coats, waiting, of course, till each one is thoroughly dried. Make a little thick starch and paste tinted paper on the inside; then at a trifling cost, purchase a variety of scrap or decalcomanie pictures. Arrange them tastefully on the outside and put a fastening on to keep the lid down. If the gift is for a lady, use prettily tinted paper on the outside instead of varnish, and edge with silver or gilt paper; cut in strips an inch or more in width, and *pink* around the edges, using the same style of pictures for decoration. This has a pretty effect and makes a useful receptacle for handkerchiefs, gloves, gent's collars, ties, etc. Put a little perfume satchel in each one to smother the tobacco odor. Will give you another style of decorating in a later number.

For "Zena's" benefit, the wife of "One of Them" has had her say in the issue of December 11th. Her husband's piece did not frighten her in the least, only she might have hit him a little harder if she had chosen, but reserved her forces for the next charge. MARIA.

Guelph, Dec. 26th, 1879.

Cricket.

AVERAGES FOR 1879.

CHESTNUT HILL CLUB, OF PHILADELPHIA.

During the season of 1879—the second year of the club as regularly organized—there were ten First Eleven matches played, five of which were won, and five lost; also four Second Eleven matches, two being won and two lost. This record, when added to that of 1878 (five First Eleven matches, four won and one lost; one Second Eleven match, lost) will make a total for the first two years of twenty matches played, or twelve won and eight lost. Through the kindness of Mr. H. B. Borie, the club's secretary, we are enabled to annex last season's averages, both batting and bowling :—

ST. ANDREW'S CRICKET CLUB.—This fine little organization of St. Andrew's Parish, Manitoba, numbers at this time over forty members. The officers elected for the ensuing year are as follows: Mr. Thomas Sinclair, President; Mr. S. E. Smalley, Vice-President; and Mr. James Taylor, Secretary-Treasurer. Committee of Management: Messrs. Hay, M. P. P.; Ed. Mount, R. McDonald, W. Sutherland, Edwin Hodgson, Ed. Linklater, A. Hodgson and James Sinclair.

PHILADELPHIA CRICKET CLUB.—At the recent annual meeting of the Philadelphia Cricket Club, a committee was appointed to confer with a committee of the Germantown Cricket Club, at the request of the latter, who have suggested a consolidation of the two organizations. The P. C. C. played only one really first class match last season, which it won, defeating the Germantown.

FOREST CITY CRICKET CLUB, OF CLEVELAND, OHIO.

We publish in full the following interesting letter from the energetic Secretary of the Forest City Cricket Club as it gives the origin and history of the game in the Buckeye State :—

CLEVELAND, Ohio, *Jan. 22d*.

Editor Forest and Stream :—

Just one year ago last July we started our cricket club in the following manner: Mr. A. A. Richardson and myself decided to organize a club. We talked with several old cricketers in regard to it, but could get no encouragement. We were determined; so one evening he and I, alone, went out on a common near our homes, and with some old sticks for wickets, and an old bat and ball, we commenced to pound away, getting several boys to field for us. When we were through we held a meeting, just he and I, and organized our club, elected officers: Dr. A. B. Hallewell, President, Mr. Richardson, Captain, and myself as Secretary. We took a report of the meeting and had it published in the daily papers. We then waited on Dr. Hallewell and apprised him that he had been elected unanimously, and he promised us his support. We drew up and adopted a constitution and by-laws, a copy of which I enclose. Since then we have done splendidly in working up a great interest in the game. Through our efforts there are now four clubs in this city, as follows: Forest City, Excelsior, Rising Sun, and Mechanics. I have received a letter from a friend in Columbus, who states that there is a club there. At Elyria there is one of twenty-two members. One also at Amherst, Ashtabula, and Bradford, Pa., all of which we claim to father. Before we started there was not a club in Ohio. ROBERT S. WEST, Secy. F. C. C. C.

The following is a summary of the most important matches played during the past season :—

June 7th.—Forest City vs. Excelsior, of Newburg; the former scored 88 runs, 10 wickets to fall, the latter 87 in both innings. Played on the Excelsior's grounds.

July 5th.—Forest City vs. Excelsior; one innings each, Forest City, 186; Excelsior, 9. Played on grounds of the former and resulted very disastrously for the visitors.

Aug. 7th.—Forest City vs. Chatham, of Chatham, Ont. Forest City, 137; Chatham, 235. Played on grounds of the former. This match was the first defeat the Cleveland Club ever sustained. Although it was expected by them, they feel justly proud at the good showing they made against the veterans from the Queen's Dominion. This match lasted two days, and was by far the most pleasant one of the season, and the gentlemanly conduct of the Chathamites will long be remembered.

Aug. 15th.—Forest City vs. Pittsburg; one innings each. Forest City, 154; Pennsylvanias, 67. Played on grounds of the former.

Aug. ——Forest City vs. Peninsular, of Detroit; the former scored 52 in both innings; Peninsular, 94, with ten wickets to fall. Played at Cleveland.

Sept. 16th.—Forest City vs. Pittsburg. Played at Pittsburg, Pa. Forest City turned up with only seven men; four of the best players, including the two bowlers, having failed to connect; the seven, however, contributed 147 in both innings. Home club, 152, eight wickets to fall.

It will thus be seen that out of six matches played, three were won and three lost; a good showing for a young club. It is hoped by cricketers in Cleveland that the game has now got a permanent foot-hold, which it will maintain in the future.

PUBLISHERS' DEPARTMENT.

—The January number of the United States Official Postal Guide contains many features which make it indispensable to all who wish clear and accurate information about the Postal Service. It is an absolute necessity for business men and all who have much dealing with the mails. The publishers are Houghton, Osgood & Co., Boston, Mass. Price, paper, $1.00; cloth $1.50.

COOK'S TOURS.—A trip through Europe is a very simple thing when undertaken under the management of Messrs. Thomas Cook & Son, of London and New York. Three grand excursions will leave New York for Europe during the spring and summer. The first is the "Annual May Party," which will leave April 29th. The second is the "Annual Educational Vacation Party," specially arranged for teachers and students, and leaving New York July 3d. The third is Cook's "Midsummer Party," which will leave New York July 31st. The two last excursions give the choice of three routes. Each of these three grand excursions will be under the personal supervision of capable and experienced conductors, and it is announced that there will be no crowding on the steamers, only two persons occupying a state-room.

Many people have fallen into the error of supposing that to secure the advantages of Cook's system it is necessary to travel in parties and by arbitrary routes. This is not so. Three-fourths of the enormous business of the firm consists in supplying *single travellers* with international traveling tickets by all chief lines of steamers and railways to any part of the globe.

AN OLD MAN REJUVENATED.—Peter Showerman, of Batavia, N. Y., certified Sept. 15, 1879, as follows: "For forty years I have suffered with kidney and liver difficulty and have also been a great sufferer from palpitation of the heart. I am now using your Safe Kidney and Liver Cure, and can truly say, at 70 years of age, that it makes me feel like a new man."—[*Adv.*

—We shall be pleased to communicate with any parties who may furnish yearling does for a Long Island game preserve.

—See advertisement of explosive target balls.—[*Adv.*

Forest and Stream and Rod and Gun.

AS WE do not employ any authorized agents or canvassers, we offer our friends in every locality who will give any time or attention to collecting and forwarding subscriptions, the following inducements to obtain subscribers for the "FOREST AND STREAM" at the rates and commissions given below:

Collect Subscription price,	3 months, $1.00	6 months, $2.00	1 year, $4.00	2 years, $7.00	3 years, $10.00
Commission to be retained,	3 " .25	" .50	1 " 1.00	2 " 1.50	3 " 2.00
Amount to remit us,	3 " .75	6 " $1.50	1 " $3.00	2 " $5.50	3 " $8.00

Condition to the above Commissions, we offer the following CASH PREMIUMS:

To the person sending us the largest amount of money obtained from new subscribers, whose names are not now on our books, at above net rates, between January 1, 1880, and July 1, 1880, ... $100.00
To the one sending the next largest amount, in accordance with the above conditions, ... 75.00
To the third on the list, ... 50.00
And to the fourth, ... 25.00

Sample Copy, Subscription Blanks and a handsome Show Card (to be posted in a conspicuous place) sent free on application.

THE GUN OF THE FUTURE.

WM. POWELL & SON'S
Hammerless Shot Gun, $250

It has the finest mechanical action, the surest safety catch, finest finish. Pattern guaranteed. Sole agents in New York for CARD'S REVOLVING BALL TRAP.

SOMETHING NEW FOR

1880.

THE LITTLE GIANT

Pocket Scales.

A GREAT CURIOSITY.

THE MOST USEFUL INVENTION KNOWN.

WEIGHS FROM ONE OUNCE TO 8 POUNDS.

THE ONLY SCALE OF THE KIND MANUFACTURED

ELEGANTLY NICKEL PLATED, AND WARRANTED ACCURATE.

PRICE FIFTY CENTS.

Sample sent by mail to any address on receipt of the price.

[MANUFACTURED ONLY BY

Chas. Thompson,

Bridgewater, Conn.

THESE LITTLE POCKET SCALES weigh from one ounce to eight pounds. Each and every one is warranted accurate, or money refunded. Everybody needs one, as they can be easily carried in the vest pocket, and they take up no more room than a small pocket knife. They are elegantly nickel plated and nicely finished, and will last a lifetime with ordinary care.

The Commercial Advertiser of Detroit, Mich., says:—

Of the thousands of new inventions which make their appearance yearly, but few are of practical use, but when we see one that fills the bill for the purpose for which it is intended, we are forced to acknowledge its merits. Such is the case with THOMPSON'S LITTLE GIANT POCKET SCALES. They weigh accurately, and can be carried in the pocket, and are sure to become as indispensable an article as a pocket knife. Hereafter we do not expect our wives will be grumbling about the butcher cheating us in weight, for we intend having a pair of these scales in our pocket at all times."

Every business man, mechanic, or farmer, every employer, and every employé, male or female, needs THE LITTLE GIANT SCALES, as they can be depended on at all times for accuracy in weighing. I am the Sole Manufacturer of these Scales and own all the tools and special machinery for making them. Only skilled labor is used in their construction; hence I am able to make them perfectly. The pattern is the most beautiful one made. They possess two great advantages; beauty and elegance of design and finish, and accuracy in weighing. No dealer in the world can give you a Scale equal to this for less than $5.00. Every Scale we send out is in perfect order, and is warranted for twenty years, with good usage and care. It is the biggest bargain in America, and is very low at 50 cts. each, and we guarantee satisfaction or money refunded.

AGENTS WANTED EVERY WHERE!

to introduce these Scales in all sections of the country; and you will find them the very fastest selling article on the market. Order a few dozen, and give the business a trial. Some of our agents sell a gross a week right along, which is good enough wages for anyone. All we ask is to give them a trial. We offer you no claptrap, trashy chromos, or receipts, but something that is good and useful for everybody, and will stand on its own merits. Our discounts to agents are very large, which will enable you to double your money.

The attention of Novelty Dealers and experts is called to these scales. Correspondence solicited.

Agents should send in their orders at once, and get the start. Don't delay, but order at once These scales will sell to nearly every family. Hunters, trappers and sportsmen will buy them at sight, as they are no "catch-penny" affair and are original and unique in design and construction. By making these scales a specialty, getting them up in large quantities, under our own personal supervision, and only using first-class material, we are able to sell this article at a lower price than the same could be produced by most manufacturers. These Scales are finished in heavy nickle plate, and thoroughly tested before being sent out, and satisfaction is guaranteed in every particular.

Sample mailed free to any address on receipt of 50 cts., or three scales for $1.00.

Circulars free to any address.

All orders should be plainly directed to]
